Siemens & Halske Electric Company of America.

Siemens & Halske: Berlin, Charlottenburg, Vienna, St. Petersburg.

MANUFACTURERS OF

Direct Current Slow Speed Multipolar Generators and Motors.

These machines are constructed with *external armatures*. They have proved remarkably efficient and economical. Used largely in American and European Lighting and Railway Plants. Slow-speed machines, made for direct connection in sizes from 20 H. P. to 2,000 H. P.

ADVANTAGES OF OUR EXTERNAL ARMATURE TYPE:

Maximum peripheral speed of armature with slowest engine speed. Shortest possible winding of armature. Lowest internal resistance of armature.
Only 3 to 4 volts difference of potential between commutator bars. Greatest radiating surface possible. Maximum magnetic effect.
Greatest weight of copper per ampere of current. Armatures cannot burn out. Great compactness.
Correct mechanical design. (The centrifugal force is counteracted effectively by the inward pull of the internal field magnets.)
Finest quality of iron, excellent finish, absence of binding wire.

In 8 years' continuous service not one Armature has been replaced or repaired. **Over 200,000 H. P. in use for Railway, Lighting and Motor Service.**

WORLD'S FAIR DIPLOMA AND MEDAL FOR BEST DIRECT CONNECTED GENERATOR.

MODERATE SPEED BIPOLAR GENERATORS AND MOTORS,

With Siemens Drum Armatures, which are copied extensively in this country. We are building these machines in sizes from 1 H. P to 150 H. P.

EDITORIAL NOTES.

There are still left in this trade a large number of men who have entered into it for their life work. They may be disheartened, but they have not given up. It is for them that we write. To them we present our argument, and to them we must all look for the re-establishment of business principles, the reinforcement of the doctrines of common sense.

It is for these men to consider just why wrong has temporarily triumphed over right, why it was possible for the tricksters and adventurers to bring the industry to its present condition.

And when these questions receive careful thought the only answer possible is that the electrical press has not done its duty.

If the "Electrical Engineer," the "Electrical World," the "Electrical Review" and the "Western Electrician" had faithfully done their duty by the trade they claim to represent, whose best interests they claim to guard, the present situation would never have confronted us.—"ELECTRICITY," June 5, 1895.

The Elevator Trust. On another page we give space to a communication from Mr. R. T. Crane, president of the Crane Elevator Company, which has been called forth by our recent strictures on the business methods of the Elevator Trust, of which Mr. Crane's company is a prominent member. The letter is a dignified and gentlemanly one, and while we are always ready and glad to print both sides of questions raised in our columns, we are particularly glad to give space to communications such as this. We can scarcely regard Mr. Crane's letter as a reply to what we have said against the Trust, for it is partly an admission and partly an evasion of the questions we had raised. In one point only does Mr. Crane meet us squarely, viz., where he denies flatly that the bids of the several companies composing the Trust are according to a mutual agreement. We must therefore have been in error in this. Mr. Crane admits, however, that "there are a number of persons in this country who, to a certain extent, control one another," and that "these builders have a right to utilize all the good things that there are in all the patents belonging to all these different companies," and maintains that the public has no right to complain of anything of that kind *unless undue advantage* is taken of them. The italics are ours. We must understand from this, then, that the Elevator Trust is an eleemosynary institution, in which each member gives to every other member the free use of all the good patents which he owns, in order that he may have no advantage over his brother members in competitive bidding and the public may be the gainers. In other words, the members of the Trust are banded together for the purpose of fostering among themselves a spirit of competition.

The *Morning Advertiser* of January 7, 1893, contained the following statement:

> "AN ELEVATOR TRUST."
>
> "Each company does the business of a certain portion of the country.
>
> "As soon as word is received that a new building is to be erected in which an elevator will be required, the combine fixes up a set of bids, all close together, but one of which is lower than all the others. The low one comes from the firm in whose territory the sale is to be made. If by any chance it is awarded to any of the other firms of the combine, the contract is filled and the matter is adjusted among the elevator men."

The fact that this, until now, has gone without contradiction, and that other unfortunate fact, that the business community with which we have had most to do had not yet developed the altruistic side of its nature to the same extent that the members of the Trust appear to have, must be our partial excuse for the erroneous belief that the organization of which Messrs. Crane and Otis are conspicuous members was *not* an eleemosynary institution.

Referring now to the above italicized portion of what we quoted, Mr. Crane is certainly right in his belief that the public have no cause to complain of the Trust or of its methods "*unless undue advantage*" is taken of them, but just there is the very point which we have been endeavoring to emphasize, viz., that the Trust *has* been taking undue advantage—not only that, but it has stooped to low and dishonorable methods to squelch competition from outsiders. It is not necessary to rehearse examples of practices chargeable directly to the Trust which no honorable business man can countenance. Many of these have already been given in these columns. We are glad to believe that Mr. Crane was not cognizant of or responsible for any of these. He has other and much larger interests to engage his attention, and the elevator business may in a sense be regarded by him merely as a side issue. We trust, however, that now his attention is drawn to these things, he will use his influence to correct the abuses that have grown up in the business around him.

Mr. Crane says: "In connection with this combination, I would also say that prices have not been advanced in consequence of such combination, or since it was formed, but instead of advancing they are continually going lower." This is the gospel truth—but why? Not through any fault of the Trust, surely. But Mr. Crane answers it quite as well as we can when he says: "*Notwithstanding the combination*" the prices have come down. Why? Because "there is a larger number of elevator builders outside of it—certainly enough to keep up a healthy competition." This admission is certainly a candid one, and is far-reaching when we understand its full purport. It means that notwithstanding the fact that five of the most prominent and wealthy concerns in the business have banded themselves together so that each may have "the right to utilize all the good things that are in all the patents belonging to all these different companies" against unorganized outside competition, still that outside competition has been strong enough to threaten the stability of the Trust with all its "good things." There must be some merit behind all this, but is Mr. Crane willing to confess that with all its "good things" the Trust is yet inferior to its individual outside competitors?

Mr. Crane makes one statement in regard to the cost of electricity that astonishes us in view of the present state of the art. While impliedly admitting that under certain conditions it might be cheaper to operate elevators by electricity drawn from the street mains than by hydraulic means, he raises the question as to whether it would be as cheap if the electrical power were generated locally. It is a fact, undisputed until now, that when the demand for current reaches any considerable proportion it *is cheaper* to generate it locally than to buy it from the central station. Else why do all of our modern office buildings install isolated plants? As a matter of fact every one knows—nearly every one knows, that isolated plants are installed simply because it is found economical to do so.

Mr. Crane raises the question as to whether it is not cheaper to transmit the power to elevators by hydraulic means than by electrical means. Under the conditions he is probably correct, that it is cheaper to transmit a given power a short distance by hydraulic means than it is to transmit the same power the same distance by electrical means. Not necessarily *cheaper*, but undoubtedly the hydraulic means would be the more efficient. But in elevator practice that is not the situation. Equal quantities of energy are not required to do the same work in the electrically and hydraulically operated elevator. By the latter means the elevator requires the maximum energy whenever it requires any at all—it requires the same amount of energy to raise the car empty that it does to raise it with its fullest load, and herein lies its lack of economy. The electrically operated elevator, however, requires energy only in proportion to the load it is carrying, and herein lies one of its greatest advantages and economies.

As to the relative merits of the respective makes of elevators, hydraulic and electric, we have little concern, personally. Mr. Crane singles out the Sprague elevator as one with which he would like to try conclusions, and implies a lack of willingness on the part of Mr. Sprague to meet him in contest. Mr. Sprague will doubtless reply in person. We have such confidence in his ability to take care of himself that we would regard it as supererogatory on our part to undertake any defence for him, even if we felt inclined to do so.

THE current number of *Cassier's Magazine* is of intense interest. The great Niagara plant is fully described by those best qualified for the work, the entire issue being given to this subject. It will be for some time the mine from which searchers for information as to this enterprise will dig for it.

On Monday last, July 15, power was sent over the line from Folsom to Sacramento, 24 miles, and the street car system of the latter city operated thereby. Everything is reported to be working satisfactorily. Current is transmitted at 10,000 volts.

GENERAL ELECTRIC'S FINANCING POLICY.

Northwest General Electric—The Scheme, the Companies Financed, the Facts and Figures from the Official Record.

HOW BONDS ARE MANUFACTURED FOR NEW ENGLAND INVESTORS.

CHAPTER I.

The Winona General Electric Company.

INTRODUCTORY.

About nine years ago the Northwest Thomson-Houston Electric Company was organized, under the laws of Minnesota, with offices at Minneapolis. The company was simply a selling agent, owning the patent rights for T.-H. apparatus in northwest territory. Upon the organization of the General Electric Company in New York the name of the Minneapolis concern was changed to the Northwest General Electric Company. A controlling interest in the stock of the Northwest Company has always been owned by the parent company in the East. While the former had always been represented to be an extraordinarily prosperous concern, it suddenly went into liquidation in the latter part of 1894, and Mr. H. M. Byllesby, the former manager, is at present in New York completing the winding up of the company's affairs. No receiver has ever been appointed, and there has been no public confession of bankruptcy. The minority stockholders of the concern have had no official notification of the decision of the majority to close up the affairs. They only know the situation from what has appeared in the public prints, chiefly in ELECTRICITY. In 1894 a committee went to Minneapolis, took by force all the assets there were in the safe of the Northwest Company, left the town in the middle of the night, and turned the stolen securities over to the G. E. Company, in whose latest schedule they appear as assets. Thus the debt of the Northwest G. E. to the General Electric Company, for apparatus bought, was cancelled.

In the last two reports of the G. E. Company, over the signature of Mr. C. A. Coffin, president, there have appeared statements intended to convey the impression to G. E stockholders and to the public that the collapse of the Northwest Company was an accident for which no one in the management of the G. E. Company was responsible.

The purpose of the present series of articles in ELECTRICITY is to prove by the presentation of official records and statistics that the ill-starred career of the Northwest G. E. Company was only an incident of the gigantic swindling scheme conceived and engineered from start to finish by Mr. C. A. Coffin, fostered first by the Thomson-Houston Company, and later by the General Electric Company. We shall prove that there was nothing unique or exceptional in the conduct of the Northwest G. E. Company; that every feature of the swindle there has been duplicated in greater magnitude by the parent T.-H. and G. E. Companies in the East, and that there is no escape from our charges against those in control of the parent company, not alone Mr. Coffin, but the bankers and capitalists who have sat in the Board of Directors.

We shall prove to the satisfaction of every unprejudiced man that the disastrous ending of Northwest General Electric, in which the stockholders will be assessed in the final settlements, is but an anticipation of the larger failure which awaits the parent company, "built up" on exactly parallel lines. We shall show that the failure of neither was an accident, but the result of a premeditated swindle, a cold-blooded, conscienceless scheme for robbing the financial institutions and smaller investors of New England and the East.

The series of articles will continue for several weeks. We shall print first official records, and then present a clear exposition of the affairs of the Northwest Company from the time of its beginning, under the guidance of Mr. E R. Gilman, to the time of it disgraceful end. We will show that the parent and constant promoter of the entire scheme was Charles Albert Coffin.

NORTHWEST GENERAL ELECTRIC.

As before stated, this company was only a selling agency. Its assets in the beginning consisted of territorial rights only. As it sold plants it bought the apparatus on credit from the parent T.-H. or G. E. Company, sold it for bonds, turning the latter over to the United Electric Securities Company in the main, realizing cash enough to pay the G. E. Company, and keeping part of the stocks and bonds received in its own treasury.

The charge of ELECTRICITY is this, that—

THE ENTIRE CAREER OF THE T.-H. AND G. E. COMPANIES HAS BEEN A GIGANTIC SWINDLE, BASED UPON THE SALE OF WORTHLESS BONDS AND STOCKS TO THE PUBLIC.

We shall now present an unanswerable argument—a complete analysis of the condition of the various companies financed under the direction of Mr. C. A. Coffin through his agents in the Northwest General Electric Company, and later a comparison of these companies with some of the companies directly handled by the parent companies themselves.

One of these companies (Tacoma) has already been reviewed (ELECTRICITY, Vol. viii, No. 22). In this issue we take up the case of the Winona G. E. Company. The figures presented in this and succeeding articles are official, copied directly from the books of the various companies.

THE WINONA GENERAL ELECTRIC COMPANY.

When the T.-H. financiers began operations in Winona there was a lighting plant there, equipped with Van Depoele apparatus. There was also a horse railway with four miles of track and old, almost valueless equipment. It had never been successful, and had had a hard struggle for bare existence. It was capitalized for about $25,000.

The first move was to get control of this property and equip it electrically. About $25,000 was paid. After this transaction the capitalization was increased to $100,000 stock and $100,000 bonds. After a brief period, during which the company had proved its inability to pay operating expenses, it was planned to consolidate the two interests—lighting and railway—issue more bonds, sell them in Boston, and swell the treasury of the parent company.

It mattered not that neither venture had been, or had any prospect of becoming, profitable Mr. Coffin wanted bonds. They might be worthless. Even so. They could be taken at 60, sold to the public at 80, and the public's losses or profits never interest the financier of the Coffinesque order.

In the latter part of 1892 it was decided to put the two companies together and play the bond-swindling game to its limit.

The property of the railway company at this time was as follows:

Grindstone..........	1.50
3 barn wheelbar'ows	3.00
3 hay forks..........	3.75
Fairbanks pit scales	1.0.00
Galvanized feed pail	.75
4 monkey wrenches.	2.50
5 S. wrenches.......	2.50
Office table..........	3.00
Hall's iron safe.....	165.00
Transfer table......	50.00
Buffalo scales, 1,000 lbs................	24.00
Hay on hand........	6.00
Total...........	$83,902.22

The company had no power house, but hired their power from the Indurated Fibre Company, for which they had to pay cash weekly. It had four miles of track, five closed and two open cars. The car shed was of the cheapest possible wooden construction.

In February, 1893, when Mr. Coffin decided to consolidate the companies under the name of the Winona General Electric Company, he had the condition of the railway enterprise laid before him in detail.

The condition and prospects of this concern are made sufficiently clear by the following statements:

[COPY.]

WINONA CITY RAILWAY COMPANY.

TRIAL BALANCE FOR TWELVE MONTHS, ENDING JANUARY 31, 1893.

Property account........................	$193,803.80	
Electric plant...........................	3,000.00	
Northwest General Electric Co........	14,370.00	
Track equipment	1 689.43	
Car equipment..........................	687.26	
Organization expense..................	404.50	
Tools and fixtures.....................	39 25	
Overhead construction................	8.78	
Building extension....................	87.32	
Cash..	157.66	
Transportation......	7,272.96	
Motive power............................	6,986.07	
Maintenance of cars and motors......	2,974.04	
Office and superintendence............	1,944.80	
Maintenance of way....................	1,148.18	
Contingent expense.....................	3 5.00	
Insurance.................................	370.23	
Taxes.....................................	262.08	
General expense......................	145.52	
Personal injuries.......................	68.00	
Repairs to steam plant.................	14.00	
Interest on bonds......................	3 000.00	
" " notes..........................	2,695.01	
		$241,504.07

Credits.

Capital stock............................	$100,000.00	
Bonds......................................	100,000.00	
Notes payable............................	20,870.56	
Earnings	20,477.90	
Advertising..............................	125.00	
Surplus.	30.61	
		$241,504.07

Analyzing the above, we find that the financial status of the company did not warrant any further increase of bonded debt. It was already bankrupt, and should have been thrown into the hands of a receiver. The summary shows that the capital stock was already impaired to the amount of $34,761.77.

CONDENSED BALANCE SHEET, WINONA CITY RAILWAY COMPANY.

12 MONTHS ENDING JANUARY 31, 1893.

LIABILITIES :		
Capital stock...........................	$100,000.00	
Bonds......................................	100,000.00	
Bills payable............................	20,870.56	
Interest on bonds due and accrued.	5,000.00	
Interest on notes........................	2 69 .01	
		$228,565.57
LESS ASSETS AS FOLLOWS :		
Real estate, roadbed, franchises and plant, per inventory....................................		$193,803.80
Deficit..		**$34,761,77**

In addition to the unquestioned fact of impairment of capital, a far worse condition of affairs is shown by the statement of earnings and expenses :

[COPY.]

WINONA CITY RAILWAY COMPANY.

EARNINGS AND EXPENSES FOR TWELVE MONTHS, ENDING JANUARY 31, 1893.

Earnings.

Fares collected.............................	$20,477.90	
Advertising.................................	125.00	
		$20,602.90

Expenses.

Transportation.............................	$7,272.96	
Motive power................................	6,978.07	
Maintenance of cars and motors......	2,974.0	
Office and superintendence............	1,94 ,80	
Maintenance of way.....................	1,148.18	
Contingent expense.......................	375.00	
Insurance....................................	370.23	
Taxes...	2 2.08	
General expense..........................	145.52	
Personal injuries..........................	68.00	
Repairs to steam plant..................	14.00	
Maintenance of power station........	8.00	
		$21,5 1.88
Deficit..		$958.98

Interest.

Interest on bonds.........................	$3,000.00	
Interest on notes..........................	2,6 5.01	
		$5 695.01

The above, however, does not clearly express the facts. Analyzing the official report, where in spite of every effort to conceal the truth a deficit of $958.98 in operating expenses had to be acknowledged, we find the following as the actual condition :

PROFIT AND LOSS ACCOUNT, WINONA CITY RAILWAY COMPANY.

YEAR ENDING JANUARY 31, 1893.

Earnings.....................................	$20,602.90	
Expenses....................................	21,561.88	
Loss from Operation............................		**$958.98**
FIXED CHARGES:		
Int. on bonds, $100,000 at 6 per cent.	$6,000.00	
Interest on notes..........................	2,695.01	
Loss..		**$8,695.01**
ADD :		
Six per cent. depreciation on inventory of $193,803.80..		$11,628.22
		$21,2 2.21
Dividends on $100,000 stock at 6 per cent.......		6,000.00
Total Deficit in Operation..............		**$27,282.21**

If interest on bonds and notes was to be paid, and the road kept out of the hands of the courts, the deficit would be increased to $9,653.99. And looked at from an honest and conservative standpoint, to see how far the property fell short of being a safe investment, allowing the most moderate percentage for depreciation and 6 per cent. interest on the stock, we find that the total deficit in operation for one year was $27,282.21.

When the consolidation scheme was determined upon, a piece of land was bought for $6,000 and improvements made to the total amount of $60,000.

The condition of the lighting company at this time was even worse than that of the railway company. Its apparatus was antiquated, and while it had never paid expenses, it needed now, in order to run at all, a complete new outfit. This is very fairly shown by the following report which was sent to Boston:

[COPY.]

WINONA ELECTRIC LIGHT COMPANY.

SCHEDULE OF PROPERTY, OCTOBER 1, 1892.

Real Estate :
  Lot 5, Block 8, of original town, 60 x 140 feet.
  Brick building, with stone foundations, 40 x 85 feet.
  Stone foundations for engines and dynamos.
Steam Plant :
  Three steel boilers, each 54 in. x 16 ft. (80 H. P.). Set complete.
  One iron smoke stack, 50 in. x 60 ft. above building.
  One Buckeye engine, 15 in. x 30 in.
  One Ball aut. " 12 in. x 12 in.
  One heater, 250 H. P.
  Two pumps.
  Five clutch pulleys.
  Shafting.
  Belts.
  Piping, valves, covering, etc.
Electric Plant :
  One 10 light Van Depoele arc dynamo and exciter.
  One 30 " " " " "
  One 40 " " " " "
  One 30 " Edison " " "
  Four 360 light (No. 8) Edison incandescent dynamos.
  75 2,000 C. P. Van Depoele arc lamps.
  24 2,000 C. P. Edison " "
  27 1,500 C. P. Mosher " "
Pole Lines :
  Poles.
  Cross Arms.
  Pins, Insulators, etc.
  Fifteen 10 ft. Adams iron masts, set.
  Two 140 ft. " " "
  Eleven miles of No. 6 arc circuits, underwriter and waterproof wire.
  6,000 feet No. 8 incandescent circuits, bare wire.
Inside Wiring :
  Installations of wire, cutouts, switches, sockets, lamps, etc.
Tools, fixtures, etc.

Memorandum.

81 city arc lamps at $87 per annum .

Monthly receipts from public lighting..........	$565,00
" " " customers' lighting........	575.00
	$1,140.00

It will be noted that the equipment of the company was worth *new* about $35,000. It was not new in 1892, but entirely out of date. Agents of the Northwest G. E. appraised it at $25,000, but the owner wanted $35 000. Mr. Byllesby said: "Ten thousand dollars is only a small matter anyway in a scheme of this kind; pay them what they want." The $35,000 was paid. The GROSS EARNINGS of this company were only $13,680 a year, and it was of course losing money.

Thus the WINONA GENERAL ELECTRIC COMPANY was launched with an investment account as follows:

Winona City Railway Company..........	$193,803.80
New improvements........................	60,000.00
Paid for Light Company..................	35,000.00
	$28 ,803.80

Upon this foundation of two worthless companies, under the consolidation, $500,000 of stock was issued and $400,000 of bonds planned to be sold in Boston.

To properly appreciate the criminality of this entire proceeding, it must be borne in mind that the lighting company had no possible chance of making any money whatever, and that the railway company would have been in the hands of the courts if the Northwest General Electric Company had not loaned the money with which to meet the interest on the bonds and notes, pending the arrangements for a new and larger bond issue.

Was there any hope that the condition of either of these properties could be improved by a consolidation? None whatever. The only hope, the only object, was to swindle the New England public by selling them worthless bonds. The only possible result was and is that every investor in those securities has lost his money. As a commentary on the gigantic capitalization of this Winona G. E. Company, it is proper to refer again to Mr. E. E. Higgins's work on street railway finances. Winona has a population of 18,200. Of railway enterprises in towns of less than 25,000 people Mr. Higgins says :

"None of the securities are worth the consideration as investments of other than local capitalists who may be able to give personal time and care to the management of the properties."

The record shows that for towns much larger than Winona a capitalization of $12.50 per capita is the largest permissible. This would allow for the Winona Railway $225,000. Adding $35,000 for the light company, we have $260,000 as the extreme limit as against the $900,000 planned by the Boston financiers. Deducting $35,000 for the light company's share of the capitalization, we have $865,000 of securities on four miles of track, or **$216,250 per mile**, and on a road which never paid operating expenses.

These are the facts in regard to the Winona General Electric enterprise, and we trust that every reader of ELECTRICITY will give them careful thought.

Nine hundred thousand dollars of securities issued on a plant costing less than $300,000 and losing $30,000 a year!

The record is plain.

Argument is superfluous. It is for those who bought the bonds to ascertain whether they were swindled within the law or not.

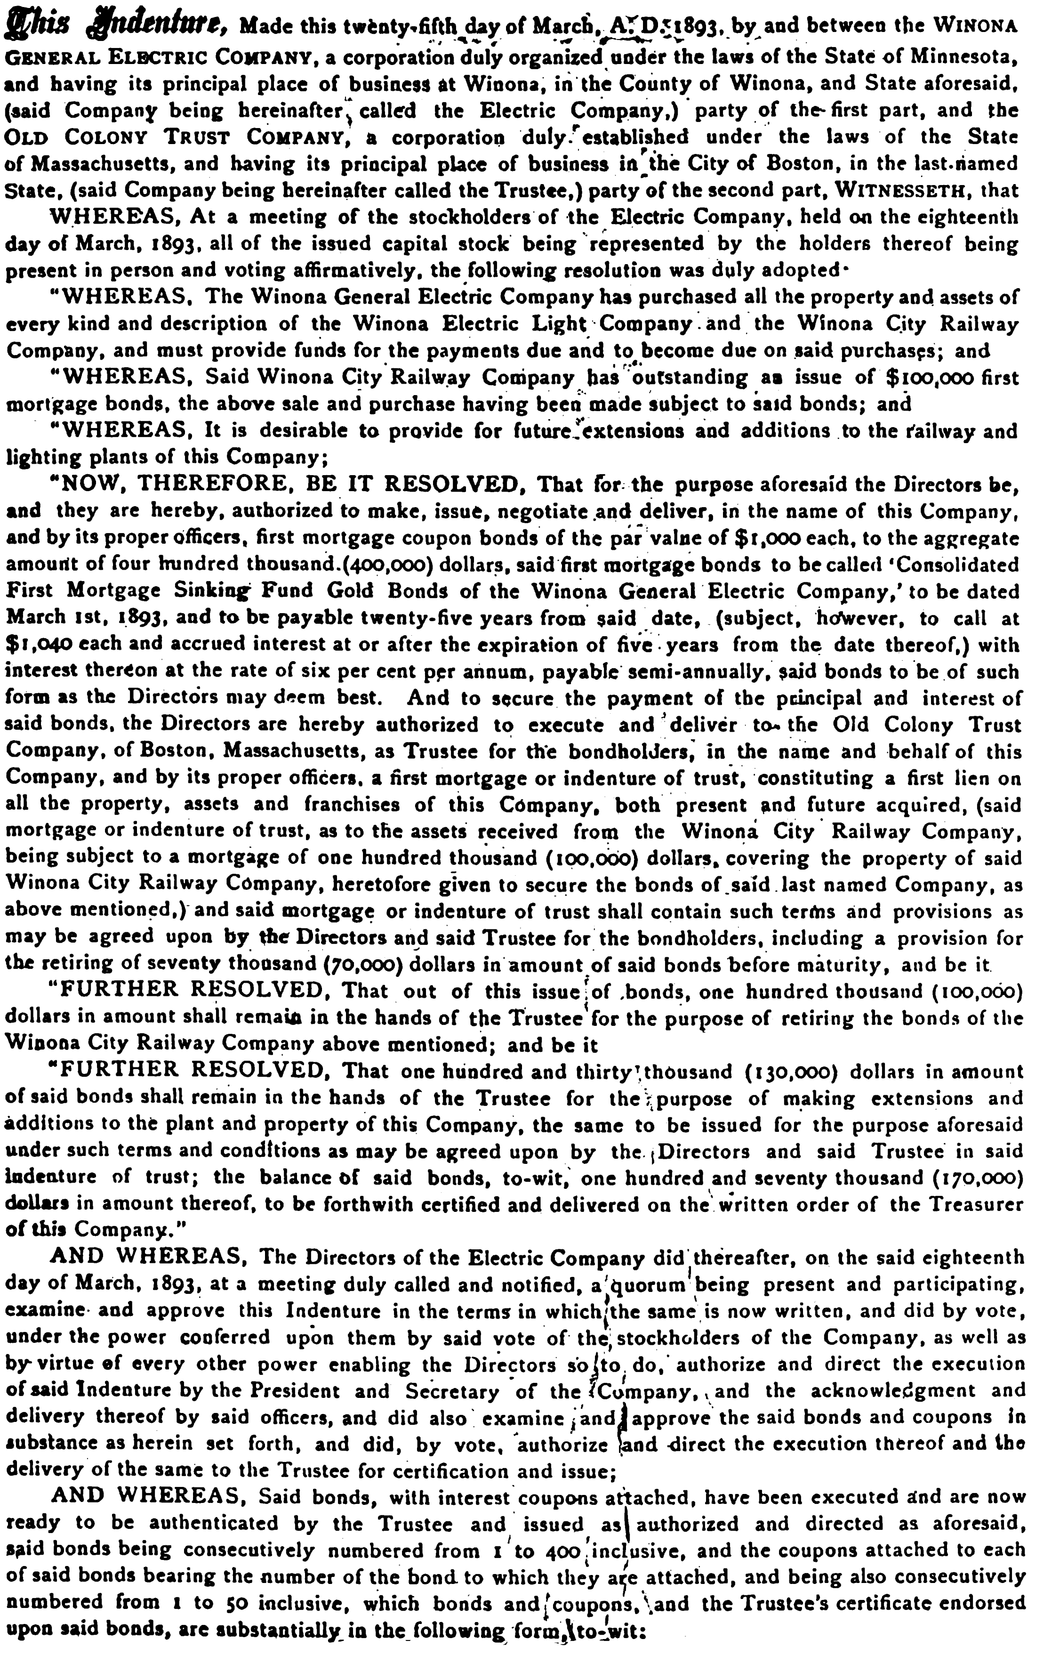
But it is for ELECTRICITY to make the evils of this infamous system of financing so plain that the system and its originators will be forever banished from the trade.

When we have finished this work it will be more evident than ever that ELECTRICITY's policy has been absolutely correct from first to last.

A Correction.

WE are informed by Mr. W. C. Bryant, of the Bryant Electric Company, that we did his company an injustice in stating that an injunction had been obtained against the latter by Mr. O. S. Platt. The news came to us through a Bridgeport daily, and we supposed it to be correct. If any injustice has been done, we shall be at pains to present the complete facts.

THE BOND AGREEMENT (Fac-simile).



This Indenture, Made this twenty-fifth day of March, A. D. 1893, by and between the WINONA GENERAL ELECTRIC COMPANY, a corporation duly organized under the laws of the State of Minnesota, and having its principal place of business at Winona, in the County of Winona, and State aforesaid, (said Company being hereinafter called the Electric Company,) party of the first part, and the OLD COLONY TRUST COMPANY, a corporation duly established under the laws of the State of Massachusetts, and having its principal place of business in the City of Boston, in the last-named State, (said Company being hereinafter called the Trustee,) party of the second part, WITNESSETH, that

WHEREAS, At a meeting of the stockholders of the Electric Company, held on the eighteenth day of March, 1893, all of the issued capital stock being represented by the holders thereof being present in person and voting affirmatively, the following resolution was duly adopted·

"WHEREAS, The Winona General Electric Company has purchased all the property and assets of every kind and description of the Winona Electric Light Company and the Winona City Railway Company, and must provide funds for the payments due and to become due on said purchases; and

"WHEREAS, Said Winona City Railway Company has outstanding an issue of $100,000 first mortgage bonds, the above sale and purchase having been made subject to said bonds; and

"WHEREAS, It is desirable to provide for future extensions and additions to the railway and lighting plants of this Company;

"NOW, THEREFORE, BE IT RESOLVED, That for the purpose aforesaid the Directors be, and they are hereby, authorized to make, issue, negotiate and deliver, in the name of this Company, and by its proper officers, first mortgage coupon bonds of the par value of $1,000 each, to the aggregate amount of four hundred thousand (400,000) dollars, said first mortgage bonds to be called 'Consolidated First Mortgage Sinking Fund Gold Bonds of the Winona General Electric Company,' to be dated March 1st, 1893, and to be payable twenty-five years from said date, (subject, however, to call at $1,040 each and accrued interest at or after the expiration of five years from the date thereof,) with interest thereon at the rate of six per cent per annum, payable semi-annually, said bonds to be of such form as the Directors may deem best. And to secure the payment of the principal and interest of said bonds, the Directors are hereby authorized to execute and deliver to the Old Colony Trust Company, of Boston, Massachusetts, as Trustee for the bondholders, in the name and behalf of this Company, and by its proper officers, a first mortgage or indenture of trust, constituting a first lien on all the property, assets and franchises of this Company, both present and future acquired, (said mortgage or indenture of trust, as to the assets received from the Winona City Railway Company, being subject to a mortgage of one hundred thousand (100,000) dollars, covering the property of said Winona City Railway Company, heretofore given to secure the bonds of said last named Company, as above mentioned,) and said mortgage or indenture of trust shall contain such terms and provisions as may be agreed upon by the Directors and said Trustee for the bondholders, including a provision for the retiring of seventy thousand (70,000) dollars in amount of said bonds before maturity, and be it

"FURTHER RESOLVED, That out of this issue of bonds, one hundred thousand (100,000) dollars in amount shall remain in the hands of the Trustee for the purpose of retiring the bonds of the Winona City Railway Company above mentioned; and be it

"FURTHER RESOLVED, That one hundred and thirty thousand (130,000) dollars in amount of said bonds shall remain in the hands of the Trustee for the purpose of making extensions and additions to the plant and property of this Company, the same to be issued for the purpose aforesaid under such terms and conditions as may be agreed upon by the Directors and said Trustee in said indenture of trust; the balance of said bonds, to-wit, one hundred and seventy thousand (170,000) dollars in amount thereof, to be forthwith certified and delivered on the written order of the Treasurer of this Company."

AND WHEREAS, The Directors of the Electric Company did thereafter, on the said eighteenth day of March, 1893, at a meeting duly called and notified, a quorum being present and participating, examine and approve this Indenture in the terms in which the same is now written, and did by vote, under the power conferred upon them by said vote of the stockholders of the Company, as well as by virtue of every other power enabling the Directors so to do, authorize and direct the execution of said Indenture by the President and Secretary of the Company, and the acknowledgment and delivery thereof by said officers, and did also examine and approve the said bonds and coupons in substance as herein set forth, and did, by vote, authorize and direct the execution thereof and the delivery of the same to the Trustee for certification and issue;

AND WHEREAS, Said bonds, with interest coupons attached, have been executed and are now ready to be authenticated by the Trustee and issued as authorized and directed as aforesaid, said bonds being consecutively numbered from 1 to 400 inclusive, and the coupons attached to each of said bonds bearing the number of the bond to which they are attached, and being also consecutively numbered from 1 to 50 inclusive, which bonds and coupons, and the Trustee's certificate endorsed upon said bonds, are substantially in the following form, to-wit:

Attempted Elevator Monopoly.

THE ELECTRIC ELEVATOR QUESTION.

CHICAGO, July 2, 1895.

To the Editor of ELECTRICITY.

DEAR SIR: My attention was called some few days since to an article in your paper on the elevator question, in which the conduct of the Crane Elevator Company (among others) was criticised, which article, to my mind, calls for a reply.

As this article covered considerable ground, it will be necessary in making reply to refer to a number of questions.

In the first place I would say that so far as the combination of elevator builders of which you speak is concerned, your statement in general is correct. There are a number of persons in this country who, to a certain extent, control one another; but I do not suppose that in this single fact there is anything of which the general public has a right to complain. I think they have no right to complain of anything of that kind unless undue advantage is taken of them.

Upon the other hand, the general public has, through this combination, had this advantage—that these builders have a right to utilize all the good things that there are in all the patents belonging to all these different companies.

Then with regard to the making of prices on each job that comes up, would say that the remarks in your article on this point are not true. This is contrary to my ideas of business, and I have never allowed it to be done in connection with this work in any instance, and I understand that it has not been done by any of the other builders.

I would further say that, so far as my company is concerned, the public has no grounds for complaint on the question of the prices for which we do the work. We have always given full value in our services—in fact, I think, a great deal more.

As to this feature of the question, when we take into consideration the great responsibility, energy and talent that have been put into the business, I think there is not another business in the country in which the same amount of labor has been expended that has paid so poorly. As an illustration, I would state that there are certain classes of machines that we are putting in to-day for which we receive not more than one-fifth the price that was paid for similar machines (but which were nowhere near so good) at the time we commenced business.

In connection with this combination I would also say that prices have not been advanced in consequence of such combination or since it was formed, but instead of advancing they are continually going lower.

Notwithstanding the combination, there is not much danger of the public being taken advantage of by it, in view of the fact that there is a large number of elevator builders outside of it—certainly enough to keep up a healthy competition.

If there were any such state of things existing in regard to prices as you complain of, and as is intimated in your paper, it certainly ought to be for the benefit of the outside builders, and why they should complain of a state of things that is to their benefit, and seek in every way to make capital of it, I cannot understand.

In reference to the St. Paul case, would say I do not see why it is unnatural for us to feel that it was an injustice to our company. I think it would be but natural for anyone to feel in the same way in such a case. If the work had been awarded to Mr. Sprague at a lower price than our figures it would have been a different mat-

(*Continued on page 7.*)

COMPOUNDING DYNAMOS FOR ARMATURE REACTION.*

BY ELIHU THOMSON.

Considerable attention has recently been drawn to the subject of means for counterbalancing or preventing armature reaction in dynamo-generators or motors. The valuable paper of Messrs. H. J. Ryan and Milton F. Thompson, read before the Institute at its meeting on March 20th, called forth considerable discussion as to the actual utility or need of added devices, which undoubtedly render a machine more complex, but which can certainly be made to obliterate armature reaction or overcome its effects. The opinion which seems to prevail amongst engineers is that by taking advantage of the best principles of design the output of our machines is not limited by armature reaction, but rather by heating or the capacity to diffuse the heat which is sure to be produced during operation.

The writer's views are in accord with the general sentiment indicated by the discussion of the paper in question, excepting that he conceives that it may on occasion become desirable to possess a structure, either generator or motor, in which a load which would inevitably overheat the machine if continuous may be borne without destructive results for short periods only. The development of engineering work may in fact demand, occasionally, machines which would be regarded as emergency machines, to be operated with the highest possible loads for short periods. It is sometimes desirable that a dynamo be adapted to driving at different speeds while maintaining the same potential at the terminals, as in the case of direct driven dynamos coupled with engnies of different makes and speeds. Such an adaptation would require a change in the armature turns, or in the field excitation, the former demanding a reconstruction amounting to the production of a special type, while the latter, change of field strength, might involve such a weakened field at the higher speeds as would be incompatible with proper commutation. In such cases means and methods for securing proper commutation and neutralizing reaction may become quite useful. The subject itself has been worked upon by the writer as far back as 1879. At first a peculiar disposition of the field coils and pole pieces was selected, unfavorable to armature reactions, and later, in a patent applied for by the writer in the year 1885 the series coil of a compound-wound machine was so disposed as to add, under load, a magneto-motive force to the field in the region of armature opposition, and as a consequence to diminish somewhat the magneto-motive force of the field where the reaction of the armature was positive or assisting.

In the present paper, however, the writer desires to bring to the attention of the Institute a different type of dynamo, worked upon by him some three or more years ago, in which there is no series winding whatever, though the machine is in effect compounded or over-compounded at will.

It is expressly to be understood at the outset that the present paper is not intended to advocate the disposition described as a desirable commercial structure, or even as one which will be likely to come into practical use on any scale. On the contrary, it is believed to be open to objections which would take it out of competition with ordinary types in which the compounding effect is secured by the series coil or load circuit wound as usual as a part of the field energizing conductor.

The machine is, however, interesting as bringing out forcibly the capability of the armature current to neutralize its own effects in a proper structure and maintain, or even increase, the potential of the brushes under heavy loads. In fact the current in the armature in the type of machine herein treated is made to react under load to magnetize a portion of the field structure which at no load is neutral or nearly so. The reaction may thus be made to give rise to a magnetic flux sufficient, or more than sufficient, to compensate for its effect in diminishing the flux of the other or excited portion. The result is accomplished by dividing each field pole into a portion which is left unwound and a portion which is wound and excited in shunt or separately. At no load only the wound polar portions act to generate the open circuit E. M. F. As the load is put on, the unwound or dead poles become active in consequence of a magnetic flux developed in them by the armature currents themselves, that is, in consequence of the M. M. F. generated by the current in the winding of the armature itself. The disposition of the poles in a bipolar structure would be represented by Fig. 1, where A A are the excited poles or wound field cores, under the fringe of which commutation is effected, while D D are the "dead" poles or sections of polar surface unenergized at no load. A dotted line *a a* may pass through the neutral or non polar portion of the armature iron, threaded by all field lines on one side, while the lines *b b* may indicate the diameter of commutation on which the brushes rest. In such a structure, by choosing the position and spread of the "dead" poles in relation to that of the wound or excited polar portions, and adjusting the M. M. F. of the initial field relatively to the turns on the armature and the speed of driving, the effect of compounding or over-compounding may easily be obtained. The "dead" poles may be made adjustable in position so as to vary the effective M. M. F. of the armature upon them and various changes in relations of the parts are conceivable.

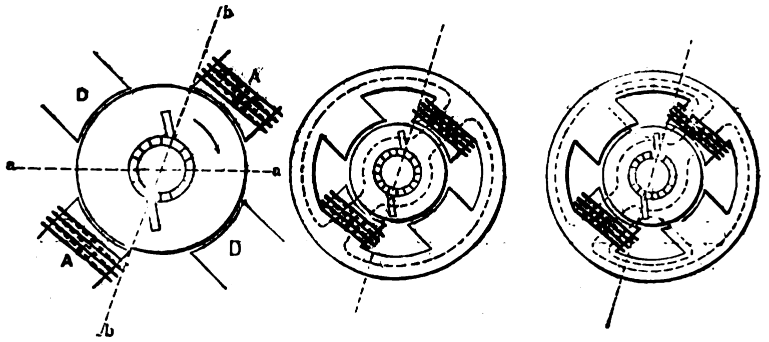
In Figs. 2 and 3 an attempt has been made to represent the magnetic flux under no load and under load respectively. In Fig. 2 the flux in the air-gap between the excited poles A A and the armature may be considered as of uniform density except at the edges, while in Fig. 3 it is, under the same pole, somewhat diminished towards the diameter of commutation. In Fig. 2 the "dead" poles are without flux across the air-gap, while in Fig. 3 the density increases from one edge to the other in the direction of rotation.

Fig. 4 is from a photograph of the dynamo constructed in accordance with the principle under discussion. It is multipolar, having four wound poles and four "dead" poles alternating in position around the armature. The latter is of standard iron projection type, being, in fact, identical in construction and dimensions with the armature used about three years ago in regular four-pole dynamos of the marine type of the Thomson-Houston Electric Company.

The principal data of the armature construction are as follows:

Diameter over all	17	inches.
Length (laminations)	8	"
Radial depth of laminations	4	"
No. of projections	87	
Width of slot	.34	"
Depth of slot	.75	"

The armature is series drum-wound and has two conductors in each slot. The commutator has 87 segments. The new field system was constructed of two rings of cast open hearth steel having heavy lugs, four in number, projecting laterally from each ring on one side, and forming the "dead" poles when assembled in the machine. Separate castings for carrying the field coils and constituting the active poles were made,



FIGS. 1, 2 AND 3.

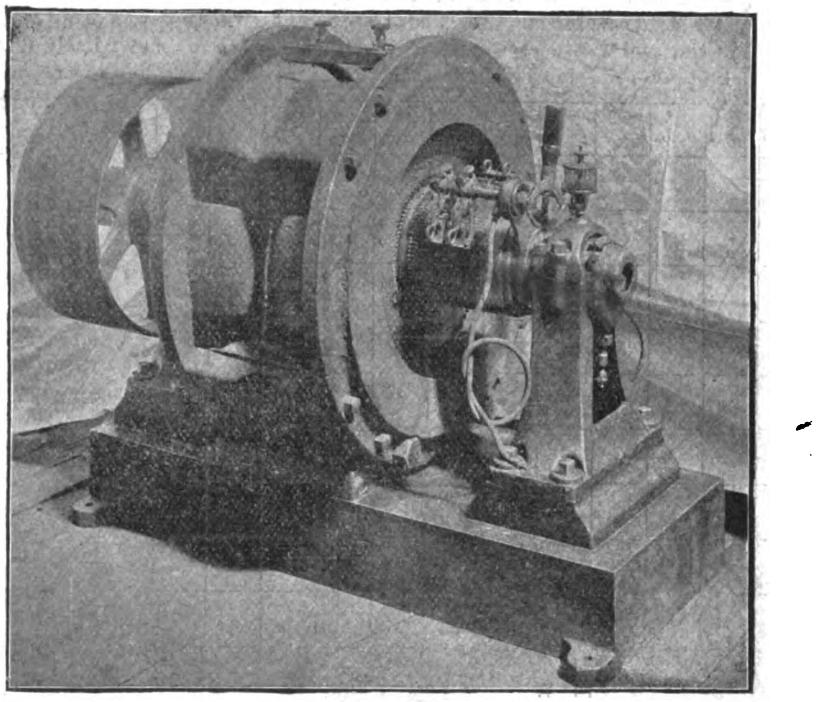


FIG. 4.

---

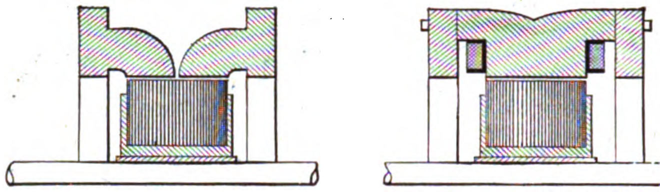
*A paper presented at the 12th General Meeting of the American Institute of Electrical Engineers, Niagara Falls, N. Y., June 26, 1895.

wound and bolted between the two ring castings of the field. The arrangement will be understood at a glance from an inspection of Figs. 5 and 6. Fig. 5 is a section of the field in a plane passing through the "dead" poles and the axis of the armature, and Fig. 6 is a similar section through the active or wound poles. The wound cores have a section of 3½ inches by 8 inches and are of steel. The field was bored to 17¼ inches, thus giving a clearance of ⅛ of an inch around the armature. The excited or wound poles covered each about 5 inches, the "dead" poles each 5½ inches, leaving spaces between wound and "dead" poles of about 1½ inches. The face of each "dead" pole is 5½ by 8 inches.

The coils on the active poles can be connected in shunt to the armature terminals with a variable rheostat in the branch, or separately excited, as desired. It was found that for the purposes of test the latter arrangement was most satisfactory, as the exciting current could then be adjusted to any given value, and would remain undisturbed by variations in the potential difference between the brushes or terminals of the machine.

Fig. 7 shows the relation of volts at the terminal to varying exciting current at no load (full line) and at 30 amperes load (dotted line) with a speed of 800 revolutions per minute. It will be noted that the load has caused an increase of voltage, particularly at the relatively higher excitations. The normal current of full load for the armature as constructed and used in the regular multipolar field was 140 amperes, and it was found that as the load was increased steadily during a run the potential was not only maintained but increased with each increment of load, thus showing an over-compounding effect. This effect was less marked when the initial excitation was weak, as when less than three amperes traversed the field coils. The over-compounding under load was, of course, still more increased when the field coils were connected in shunt to the armature. Thus, at a little over 750 revolutions per minute, with an exciting current of four amperes, the open circuit volts were 84, rising to 104 when a load of 130 amperes was put on, with an increase of the exciting current to 4.8 amperes.

It was noticed that on any considerable increase of load being made the potential rose in some cases as much as 5 or 6 volts above the point at which it would remain, or which it would reach after a short interval. Similarly it was found that the sudden taking off of load caused a temporary fall below the stable voltage under the new or diminished load conditions. This curious effect was traced to the differences of time between that needed to build up or cut down the flux in the dead poles as compared with that required to cut down or build up the excited poles, which, being wound with wire, were naturally more sluggish under the conditions of use. Currents would be induced in the coils under each change of flux, which change itself would thereby be rendered more gradual. The dead poles being unwound could respond more rapidly. Any increase of load would of course tend to break down the wound poles and to increase the flux in the dead or unwound poles, and the taking off of load would have the opposite effect.



FIGS. 5 AND 6.

Fig. 8 shows a compounding curve obtained under a constant excitation of four amperes at a speed of 790 revolutions, the load being varied from 0 up to more than thrice the full load. It will be noticed that the potential at first increases and only breaks down under extremes of load. The final breaking down is doubtless due to saturation of the forward portions of the dead poles, together with the armature core projections. Part of the drop was undoubtedly due to resistance at the brushes, which were of carbon and by no means fitted to conduct off such heavy currents. Taking this drop and the drop over the armature conductor itself, it is not surprising that at the high loads the potential should fall off.

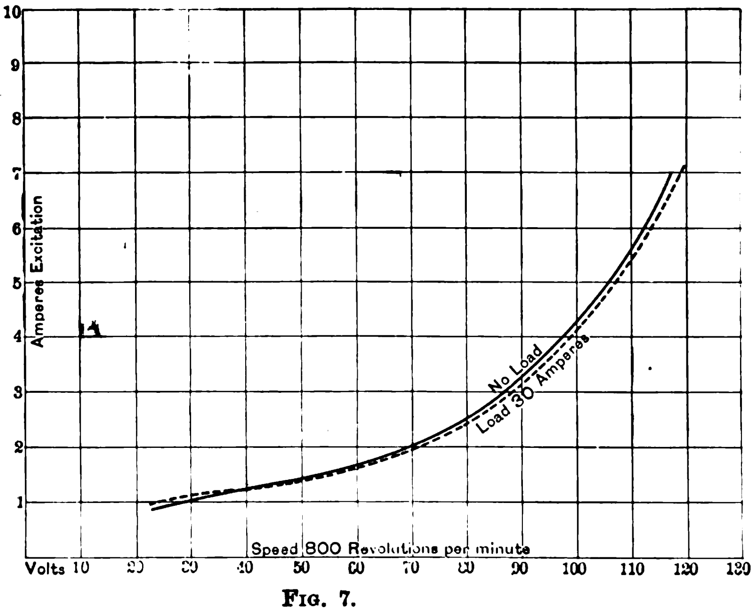


FIG. 7.

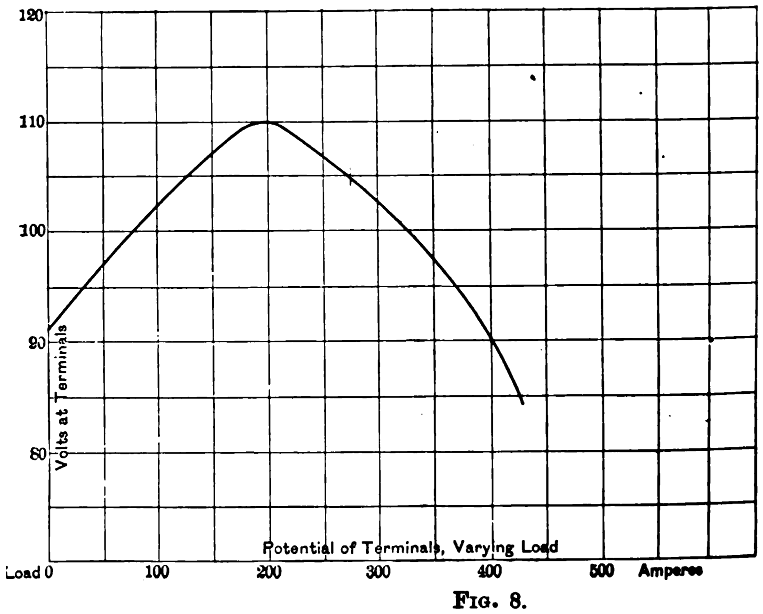

FIG. 8.

A horizontal plotting of the potentials generated in the armature coils under no load obtained by the two brush methods of Dr. S. P. Thompson is given in Fig. 9, the relative positions of the wound and dead poles being marked in dotted lines, and the arrow indicating the direction of movement of the armature relatively thereto.

Fig. 10 gives the same plotting under a load of 100 amperes and accentuates the effect of the armature reaction in magnetizing the dead poles. The curves are only approximate indications owing to the fact that the number of points at which readings were taken was less than was desirable, and because in some cases it was difficult to maintain all conditions unchanged, particularly with the very heavy loads.

Figs. 11 and 12 show a similar plotting for abnormal or extreme loads. The former shows how completely the wound pole has been broken down by armature reaction, and how the unwound poles have now become the chief working field poles, or rather how the armature winding itself has furnished the field for its own cutting. A calculation of the flux density at the forward edge of the unwound pole shows that the magnetization has risen to saturation. The other parts of the pole are shown to be still susceptible of increase of flux, but their relation to the armature is far less favorable for its generation.

The machine described is probably chiefly interesting from a theoretical aspect. Still it shows clearly that so far as the effect of the series field on compound wound machines is concerned, the electrical engineer has other resources at his command giving similar results. It cannot be doubted also that the design of armature and field might be considerably improved with special regard for the particular feature of compounding. A feature of the machine which developed itself when carbon brushes were used was that even at heavy loads the brushes could be set back from their maximum position, or true diameter of commutation in this case, and that the movement was attended with little if any increase of spark, while the potential steadily went down. It was thus easily possible to adjust the potential by a backward movement of the brushes in the space between the unwound and wound poles, while the slight sparking under the carbon brushes was not increased thereby. The writer has never noticed this effect in so pronounced a degree in any other structures, but thinks that it may not be peculiar to this machine.

A further interesting consideration is the effect of dispensing with the wound poles altogether, and either neglecting to employ any reversing or commutating field while maintaining the brushes near the forward edge of the field poles which now remain, namely, the unwound poles, or employing commutating arrangements similar to those used by Mr. Sayers, that is, returning the leads through slots in the armature under the strong induction of the forward edge of the pole as the armature leaves it. In such a case it would appear from theoretical considerations that the machine should, if it possessed any permanent magnetism, excite itself as a series dynamo entirely without any winding on the field and solely by the action of the armature winding itself. This fact was, I believe, first pointed out by Drs. J. and E. Hopkinson.

In conclusion it may be stated that tests of the machine used to generate single phase and three phase alternating currents in its armature winding were made by dispensing with the commutator and substituting rings and connections common in such cases. The results indicated a substantially similar effect of compounding, but to a less degree, owing no doubt to the fact that the phase of the electromotive force generated by the wound pole flux would not coincide with that due to reaction on the dead poles, since the position of the poles with relation to any portion of the moving wire is different at the same instant.

Gas Engines in France.

According to the *Electrical Review* (London) French gas engineers appear fully alive to the advance in gas engines. The Société Technique de l'Industrie du Gaz recently received a report from M. Salanson, stating that while little advance had been made in the principles of construction, a good deal had been done in details. Engines were becoming larger, gas was being used more efficiently, and compression before ignition was being carried to a greater degree, even, at times, to seven atmospheres, the Dick-Kerr engine compressing to five and six atmospheres with producer gas. Gas producers were extending, and there was greater regularity in the quality of their output.

Attempted Elevator Monopoly.

(*Continued from page 4.*)

ter. In the past it has been the fact in the elevator business that when a great preference in price has been given to one maker over another, it has generally been given to the maker who has shown by the test of years that his machine is durable, economical and as near perfect as the elevator art knew how to go, thereby divesting the transaction of all chance of new experiment, but in this particular instance the higher price has been given to an inexperienced company and one which has, in its machinery, departed from the well-established mechanical principles of running elevators. This would but naturally seem to be an error, and I am inclined to think that we were justified in making a contest.

Mr. Sprague's machine is like any other new thing that comes out; it may be better than the old devices and people may be justified in paying more money for it, but in our experience we have found very few persons who were willing to take the chances in such things.

The merits of their machinery can only be demonstrated after having been run for a number of years at least, and having been in the hands of persons who are not directly interested in its success.

It is well known that our machinery will, as a rule, run for a great many years at a very reasonable expense for wear and tear and care; in fact in this respect it is everything that could be desired.

While writing, I think it probably is well enough to say something that perhaps is not altogether called for in replying to your letter on this subject of electric elevators, but which may interest your readers, and it is very important that the public should be set right on this question.

In the early introduction of electricity as a power, quite a number of elevator builders—among them being the most prominent ones—at once saw that there was a field for electric elevators, and they immediately went to work to perfect and build this class of machinery.

A large number of the builders have met with reasonable success, and the only question that has troubled them to settle was, how far this machinery could be introduced to advantage—that is, when it ceased to be profitable to buy the current in the street and of more advantage to put in a steam plant, with hydraulic or steam elevators.

So far as we are concerned (and I think the same is true of other prominent elevator builders), it never occurred to us that it could be made profitable for a person to run electric elevators where he had to produce his own electricity. But Mr. Sprague has taken the bull by the horns and assumes that this can be done, and now it remains to be seen whether he is right or not.

To make this subject clear, it may be said that electricity in this machine takes the place of water in the hydraulic elevator. Neither is it a power within itself, but is simply a means for the communicating of power—as air, water, shafting, belting, etc., and the real question is, which article (everything being considered) will prove the best.

To settle this question two points must be considered—

First, loss of power in the working of this means—whether the power can be put into electricity, and then taken out of that and put into an elevator, with the same economy that water can be used.

Second, adaptability of the machinery, and the care and wear and tear caused by its operation.

Now, there is nothing very positive about the economy of using electricity in this manner. In regard to water, however, it is well understood that there is a very small percentage of loss in communicating power through this medium; and when it comes to using water for hydraulic elevators it has always been regarded as the most perfect means of communication that could be used.

Water has been universally approved of all over the world where elevator or hoisting service was required, and he is a bold man who will undertake to revolutionize this subject.

We are now brought to the question of wear and tear and the complications of the machinery used in this connection.

The first machinery is, of course, the pump, and there need be little said regarding that. All know what pumps require in this direction and what the expense is of their care.

The same can also be said of the elevator; it is the simplest and most easily understood machinery that can be devised.

But when you adopt electricity for this purpose it will be seen that you get into great complications. This is a class of machinery that is very much more liable to get out of order, and it is exceedingly difficult to understand and requires very much more attention.

These things, however, cannot be settled theoretically. Of course every one can have his opinion, and my opinion is very much averse to electricity as used under the above conditions.

Now, as this subject is of vital importance to the general public, and as Mr. Sprague and ourselves are in a position to get at the bottom of it, I have invited him to make a test, as you will see by the following communication, but thus far he has made no reply:

"Chicago, June 15, 1895.

"Sprague-Pratt Electric Company,
"Postal Telegraph Bldg., New York City.

"Gentlemen: Whereas the question of what position the electric elevator is qualified to occupy in the elevator business is an undecided one, and as this is a very essential question and one in which all elevator builders, as well as many purchasers of elevators, are most decidedly interested, we, as elevator builders, owe it to the purchasers of elevators to give them all the light we can upon the subject and to place it before them in the most intelligible manner.

"As you and ourselves are able to give this information, and assuming that you are disposed to do your part, we hereby invite you to make a test of electric as compared with hydraulic elevators at such time as suits your convenience, which we trust you will be pleased to do without unnecessary delay.

"My views of the subject are that the real question only applies to the larger class of jobs and where parties furnish their own power.

"The test and investigation should cover every essential question in connection with the elevator service.

"The economical test should be confined to the consumption of fuel.

R. T. Crane,
Pres't of the Crane Elevator Co.

A SEVERE BLOW TO THE ELEVATOR TRUST.

Opinion of Judge Dallas in the Cases of the National Company vs. Belcher, and National Company vs. Morse, Williams & Co.

In pursuance of a stipulation filed, these two cases have been heard together, and upon the same proofs. They both involve the same five patents.

1. The patent to Philip Hinkle, No. 183,05[illegible], dated October 10th, 1876, is for "Improvement in air-chambers for forcing water for operating elevators etc."

The claim in question in this suit is as follows:

"1. In a hydraulic hoisting device, an air and water chamber, A, interposed between and communicating with the elevator-cylinder and a pressure-generator, substantially as described."

In the specification, it is said:

"I may employ a pump, or such construction that when there is a determined amount of pressure in the chamber, A, the pump shuts off, but when the pressure lowers, the pump again starts."

This is the only mention which is anywhere made of any particular kind of pump or construction, and it amounts to nothing more than a suggestion which may, or may not, be followed. Complainants' expert says that "the patentee proposes to provide the pump of such construction that a determined amount of pressure in the tank chamber, A, will automatically stop the pump; the pump being started again when the pressure in the chamber becomes lower"; but for this statement there is no other foundation than the language which I have quoted from the specification. Whether the patentee, if he had, in his claim, specifically designated the automatically-acting pump here referred to, would have strengthened his position is at least doubtful; but as it is very plain that the claim does not call for any peculiar form or construction of "pressure generator," inquiry as to whether a claim so constructed might have been made and sustained would be profitless. As it stands, this claim has been met by overwhelming evidence of anticipation, and, therefore, I am constrained to hold that it is invalid.

2. The patent to Charles R. Otis, No. 228,107, dated May 25th, 1880, is for an invention which, as stated in the specification, "consists in means . . . for preventing accidents from the breaking or slipping of the hoisting rope of an elevating apparatus, or from the cage acquiring an undue velocity from any cause; the invention further consisting in means for automatically restoring the parts to an operative position after the movement of the cage has been arrested or reduced."

Four of the seven claims in this patent are involved. These are as follows:

"The combination with an elevator cage having appliances for arresting or retarding the movement thereof, of mechanism for throwing said appliances into operation on an undue increase of speed, and devices for automatically restoring the said appliances to their first position as the speed is reduced, or motion arrested, or reversed, substantially as set forth.

"4. The combination, with a cage and its arresting appliances, of the cable k, connected thereto and traveling therewith, governor operated by said cable, a clamp operated by the governor to automatically grip and release the cable, substantially as set forth.

"6. The combination of the cage, its detents, the cable k, and its retarding appliances, and the spring interposed between the operating arm of the stopping or retarding devices and a bearing on the cable, substantially as set forth.

"7. The combination of the cage, it arresting devices, operated from a crank or arm, a cable traveling with the cage and connected to said arm, governor operated by the movement of the cable, and jaws arranged adjacent to the cable, to act directly thereon, and connected to the governor, to be opened and closed thereby."

The ten prior patents discussed by the learned counsel of the defendants have been carefully examined. They certainly do show that before this Otis patent was applied for much thought had been directed to securing safety in the operation of elevators, and that the trend of the inventive efforts of others had been in the same general direction as that of Mr. Otis. His construction, however, though very nearly approached, had never been reached; and, upon its introduction, the contrivance of the patent in suit was adopted in preference to anything which had preceded it, and was and is largely used. His achievement, now that it has been realized, may not appear to have been a very difficult one to accomplish, but that it met a recognized want and was regarded as being new as well as useful is quite persuasively shown by its extensive adoption and the prolonged acquiescence of the trade in his monopoly. The claim which is most seriously attacked is the third, and the reference by which that attack is most plausibly maintained is to a patent issued to John Fensom, No. 151,014, dated May 19th, 1874, for "improvement in elevators." But by that patent, although its appliances for arresting the movement of the cage may, after service, *fall* out of operative position, there are disclosed no "devices for automatically restoring the said appliances to their first position as the speed is reduced or motion arrested or reversed," and the employment of such devices constitutes a material element of the third claim of the patent in suit.

Infringement has been clearly shown. These are all combination claims, and though some of the corresponding parts in the respondents' arrangement are not precisely identical with those of the patent, yet it is obvious that they have the same purpose in the combination and effect that purpose in substantially the same manner.

Upon the authority of Dunlap vs. Schofield, 152 U. S. 244, I sustain the point made for respondents, that "there can be no recovery for damages and no accounting for profits, because the complainant has failed to allege in the bill of complaint either that the patented devices were marked 'Patented,' or that actual notice of the fact was given to the defendants, as required by Section 4 900, Revised Statutes."

In Allen vs. Deacon, 21 Fed., 122, it was held in a suit in equity that, in the absence of marking or notice, neither damages nor profits can be recovered.

3. The patent to George H. Reynolds, No. 317,202, dated May 5th, 1885, is "for means for controlling the operation of elevators." The only claim involved in this suit is as follows:

"1. The combination, with the car or cab and its controlling-valve of a lever or hand-gear on the car or cab, and occupying a stationary position relatively thereto as it travels, sheaves g g^1, and bearings therefor arranged at the bottom of the shaft and adapted to move upward and downward, other sheaves, h h, at the top of the shaft, flexible connections passing around these sheaves from the top to the bottom of the shaft and connected at their one end with the said lever or hand-gear on the car or cab, and connections between the valves and the movable bearings for the sheaves g g^1 at the bottom of the shaft, through which the movement of the lever or hand-gear on the car and the rising movement of one or other of the sheaves g g^1 will effect the shifting of the valves, substantially as herein described."

This claim was before the Circuit Court for Northern District of Illinois in the case of Crane Elevator Company vs. Standard Elevator Company, but the opinion filed by that court is silent upon the question of the patent's validity. That question is, therefore, an open one, and as such has now been considered. It is, however, unnecessary to discuss the evidence bearing upon it, except as it relates to a single matter upon which I have reached a decisive conclusion.

A German patent, No. 18,400, to D. Lampe, for "gearing for lifts," published June 8, 1882, contains this statement: "For moving cocks, valves, slide valves, pistons which have not a tendency to go into the cut-off position, the mechanism is doubled, whereby the loose rollers are set upon a two-armed lever, which then can act directly as cock key or beam." That patent was placed in the hands of a machinest and model maker, with instruction "merely to show by the construction of a model, a modification as described, of a double endless rope to operate the model as described in the specification according to his judgment as therein described: . . . only to show the operation of the modification of doubling the hand rope to move stop valves or other devices at the bottom of the shaft, as described in the specification." He had no further instructions, and received no drawings other than those which accompanied the Lampe patent, and upon information derived wholly from that patent, and the specification annexed to it, he constructed a model which fully discloses the invention claimed in the claim in suit. The learned counsel for the complainants contend that it is impossible that this model could have been produced by the exercise of mechanical skill merely, and with no other instructions than to illustrate the modification suggested by Lampe, comprising double cables, and that, therefore, either the testimony to that effect is false, or else that the person by whom the model was made also made the same invention Reynolds had made. I cannot accede to this. The evidence of the model maker is not controverted otherwise than by argument, and is supported by the testimony of other witnesses. The ability he displayed in making this model may astonish the unskilled, but, in view of the positive and uncontradicted evidence, it cannot be regarded as transcending possibility, and that it was not inventive in character is, I think, placed beyond question by his own testimony that he "did not experience any difficulty in the mechanism; the drawings and specifications made it plain." That he had himself made some inventions is true, but in doing this piece of work he was, as he tells us, a mere imitator; the drawings and specifications of Lampe, not his own inventive faculty, supplied all that was requisite for his purpose. The necessary result is that the Lampe patent must be regarded as establishing that the first claim of the Reynolds patent, No. 317,202, is void for lack of invention and patentable novelty of its subject matter.

4. The patent to George H. Reynolds, No. 456,122, dated July 14, 1891, is for "controlling device for elevators." Its two claims, both of which are involved in this suit, are as follows:

"1. In a controlling device for elevators, the combination of a car, two cables attached positively at each of their ends, to travel with the car, and connected with the controlling device, and an operating device upon the car to positively take up and pay out said cables, to shift positively the controlling device, substantially as set forth.

"2. In controlling devices for elevators, the combination of a car, traveling cables connected positively at each of their ends to the car, and passing over stationary pulleys at one end of the well, and around movable pulleys connected to the controlling device at the other end of the well, and means for positively contracting and relaxing the bights of the cables, substantially as set forth."

These claims were adjudged to be valid by the Circuit Court in Illinois, in Crane Elevator Company vs. Standard Elevator Company (supra); but I believe that if the additional evidence which has now been adduced had been submitted to that court its decision would have been different. The Lampe patent was produced in that case, but the model made thereunder, which I have already discussed, was not presented. This new matter is applicable to patent No. 456,122 as well as to patent No. 317,202; and as it shows that the Lampe patent supplied all the information necessary to enable a skilled mechanic to do all that was claimed by Reynolds in patent No. 456,122, it is a complete anticipation of that patent also.

The patent to George H. Reynolds, No. 458,917, dated September 1st, 1891, is for "controlling device for elevators." Its second and third claims are involved in this suit, and are as follows:

"2. In an elevator-control mechanism having two control-cables attached to and running with the car, in combination with yieldingly-supported pulleys, as F F, adapted to rise and fall together, substantially as described.

"3. In a cable-operating mechanism for elevators comprising two control-cables attached to the car, a weighted lever having sheaves over which the cables run for regulating and maintaining the tension of the cables; substantially as shown and described."

This patent, as to its claims 1 and 3 was adjudged invalid by the Circuit Court for the Northern District of Illinois, in another case between the Crane Company and the Standard Company. Claim 2 was not considered; but if the first and third claims are invalid, it would seem that the second must necessarily be so.

The brief of complainants appears to impliedly concede this, but insists that this case "is much stronger than the former case." As respects the argument and manner of presentation, this may be so, but if any new evidence has been introduced here, which would, if presented in the Illinois case, have affected its decision, it has not been pointed out, and I have not observed it. Therefore, following the judgment I have referred to, and without expressing any independent opinion, I hold that this patent is invalid.

Let a decree be prepared in accordance with this opinion in each case.

PULL THE STRING.

You may have forgotten it. When you receive your copy of ELECTRICITY next week, look for the little notch on right hand end of wrapper. Pull the string, and presto! the brightest trade paper in the world is before you.

Personal.

Mr. Chas. Wirt, formerly of 56 Fifth avenue, Chicago, has removed to Philadelphia, where his address is Ludlow street, corner 31st street.

General News.

What is Going on in the Electrical World.

Elizabeth, N. J.—The directors of the Elizabeth Street Railway Company have decided to equip the road with the trolley system.

Ocean City, Md.—Extensive improvements are being made here, and it is proposed to build an electric railway about six miles long.

Mason, Mich.—The city has purchased the electric light plant of Paddock & Henderson, now in operation here; $7,000 was the price paid for it.

Forest City, Pa.—The borough council has granted a franchise to the Carbondale and Forest City Passenger Railway Company for an electric railway route.

Glen Ridge, N. J.—The North Jersey Traction Company has applied to the borough council for a franchise to run a trolley line through the borough.

Meadville, Pa.—A petition has been received by the city council from Dr. T. B. Lashells asking for a franchise to construct and operate an electric railway in this city.

Charleston, W. Va.—The Charleston electric light and gas plants, the waterworks and the electric street railway have been sold to a syndicate of Northern capitalists.

Wadsworth, O.—The Wadsworth Electric Railway Company has been organized by W. A. Ault, M. C. Lytle, O. B. Dibble, J. S. Oberholtzer, F. C. Lee and F. B. McCauley.

Norwich, Conn.—Work of constructing the trolley road between this city and New London will begin in the early fall, and it is believed it will be finished by May 20, 1896. A survey of the route will be begun shortly.

Madisonville, Ky.—This city is now ready to receive bids for supplying it with thirty or more electric (arc) lights of 2,000 candle power. Mr. I. Bailey, chairman of the committee, will furnish specifications and particulars.

Detroit, Mich.—Copies of a $7,000,000 trust-mortgage given by the Detroit Citizens' Street Railway Company to the New York Security and Trust Company have been filed in the register of deeds' and city clerk's offices in this city.

Gretna, La.—Moss & Gerdes have applied to the parish authorities for the right to build and operate an electric railway from New Carrollton to East End; Benjamin T. Waldo has petitioned for a like franchise from Upertine street to Kennerville.

New York.—The new electric conduit road of the Metropolitan Traction Company, in Columbus avenue, is now in operation and works successfully. There are two motors in each car having a nominal strength of fifty horse power between them.

Austin, Tex.—Mr. W. E. Holmes, president of the Texas Gas and Electric Light Association, reports that organization as being in a flourishing and healthy condition. There are now about thirty members, and all of them take great interest in the work.

Jamaica, N. Y.—It is thought likely that a special election will be called to ascertain the will of the voters as to bonding the village in the sum of $200,000 for the purpose of enabling the village to own its water supply, its electrical light system and to macadamize all its streets.

Fremont, Neb.—The board of public works have awarded the contract for putting in an electric light plant to Bigelow & Company of Lincoln, Neb. The electric light company fought the project of the city owning a plant and operating it, but without avail.

Springfield, Ill.—The Pocatello Electric Light and Power Company of Chicago was the first corporation organized under the new corporation act of Illinois, and was obliged to pay $175 for license to open books of subscription to its capital stock of $150,000.

Los Angeles, Cal.—W. L. Richardson lately submitted to council a franchise for erecting and maintaining an electric light and power plant in Los Angeles which he wished to bid for after public notice had been given. The franchise has been ordered published and bids will be opened August 7.

Minneapolis, Minn.—As the time for holding the convention of the National Brotherhood of Electrical Workers in this city approaches, interest in the matter increases. The convention will comprise about 400 delegates, representing between 35,000 and 40,000 workers, and they will come from every section of the United States.

Youngstown, O.—The Park and Falls Electric Company of Youngstown has applied to the county commissioners for a charter for a road from this city to North Lima and Poland. They intend to carry freight as well as passengers and will complete the road by December. It is intended eventually to extend the road to Salem.

Oshkosh, Wis.—The Oshkosh Street Railway Company has appointed a committee to ascertain the cost and report upon the feasibility of substituting electricity for animal power on their lines. Charles Barber has been elected president of the company, J. H. Porter vice-president, and J. H. Jenkins secretary and treasurer.

New Orleans.—The Hart interest in the Canal and Claiborne street railroad has been purchased by local and Philadelphia capitalists, and the line as rapidly as the work can be done will be equipped with electric cars equal in speed and comfort to those now being operated by the New Orleans Traction Company.

Lancaster, O.—As a preliminary step towards the final completion of the electric street railway, Henry B. Peters, vice-president of the Fairfield County Bank, has been appointed receiver of the road, giving bond in the sum of $30,000. Several parties have been negotiating for the road for over a year, but the stockholders could not agree upon a price.

Fresno, Cal.—It is stated by those interested in the electric transmission scheme to bring power to this city from the north fork of the San Joaquin River, 33 miles distant, that the plant will be ready for operation in about four months. Power enough will be developed to supply all the lights needed and run all the machinery used in Fresno and adjoining places.

Manlius, N. Y.—A syndicate of Syracuse capitalists, headed by Charles E. Hubbell, has purchased the water power on the Appleton farm in this town. The syndicate intends to use the power to furnish electric light, heat and power for the towns of Manlius, Fayetteville and Cazenovia. Its members are also interested in the Syracuse and Oneida electric railway.

Liberty, Ind.—Right of way has been secured on a part of the route of the proposed trolley line between Richmond and Liberty, and from present indications the remainder will be secured in a few weeks. Richmond capitalists are at the head of the scheme and they are confident that the line will be ready for operation within six months. Freight will be carried as well as passengers.

Albany, N. Y.—At a meeting of the railroad commissioners, the Rome City Railroad Company of Rome, N. Y., was given a hearing on its application to change its motive power to electricity or compressed air. The board granted the road the privilege of using the trolley. The Ogdensburg Railway Company was given permission to use electricity and increase its capital stock from $75,000 to $150,000.

Whitinsville, Mass.—At a recent meeting of the subscribers of the proposed electric railway between Millbury and Rockdale, it was decided to put the road through. The following directors were chosen: F. A. Lapham, of Worcester; J. H. Ferguson, Herbert A. Ryan, Charles Buck, of Millbury; E. E. Howe, of Grafton, L. E. Chase, of Sutton, and S. M. Snow, of Providence. The capital stock is to be $100,000.

Altoona, Pa.—The Cumberland Valley Traction Company, which for a long time past has been trying to connect by a trolley road a number of the largest roads in Cumberland County, has sold out to Benjamin F. Myers, Luther Gorgas, George W. Crumbler, F. H. Alleman, W. K. Myers, all of Harrisburg, and John Skiles, of Blair County, Pa. The road from Harrisburg to Carlisle will now be completed, taking in Mechanicsburg. After that it will be extended to Boiling Springs.

St. Clair, Pa.—Proposals will be received by the borough of St. Clair up to July 31, 1895, for the furnishing of two incandescent dynamos of not less than 1,100 16 C. P. each, with station equipments; also one 250 H. P. stationary engine to run the above in connection with present dynamos, said engine to run not more than 85 revolutions per minute with 80 pounds of steam. Bids to be for engine and foundations and dynamos and foundations separately. For further information apply to Julius Sclump, superintendent, or Jacob Schuster, John H. Mullin and Samuel Dewald, electric light committee, St. Clair, Schuylkill County, Pa.

Hornellsville, N. Y.—Mr. J. Cooley, of this city, an electrician, has invented an air ship which he claims is superior to anything of the kind yet exhibited. A miniature "ship" has been tested and worked successfully. The vessel is a curiously constructed affair with wings about 12 feet long and with a body about 20 feet in length. It was built by its inventor and was not intended to carry a person, but in the wake of the model will come a machine of practical utility so constructed that it will carry a person any distance without difficulty. In the rear of the machine will be placed an electric propeller and with the rudder the slightest touch will suffice to steer it.

Baltimore.—The 90-ton electric locomotive was attached to a train of twenty-four loaded coal cars in the Belt tunnel a few days ago, but it was too much of a pull. The start was a slow one, and it was evident the test was about all the motor could stand. When the middle of the tunnel was reached the shoe of the trolley was found to be red-hot, and the connection from the shoe to the car broke. There was no time for repairs, for northbound trains were expected. So the locomotive to which the cars were attached made an effort to pull the motor, train and all, but it could not budge them. The train was then divided into two sections, and the motor and nine cars were first taken through, and then the fifteen cars were pulled through by the locomotive.—A preliminary route has been mapped out for a surface electric line 2½ miles long in Clifton Park, for use during the proposed Centennial Exposition.

Harrisburg, Pa.—Application has been made to the State Department for charters for the Philadelphia, Lancaster and Harrisburg Railroad Company, capital $6,000,000; for the Lancaster and Manheim Railroad Company, capital, $50,000, and for the Lancaster, Ephrata and Reading Railroad Company, capital $70,000. The corporators of the first-named company are John J. Patterson, J. Hay Brown, John D. Skiles, J. Gust Zook, Michael Reilly, Dr. M. L. Herr, Dr. Henry Yeagley, S. H. Reynolds and H. C. Hopkins; the corporators of the latter two companies are John J. Patterson, J. Hay Brown, John D. Skiles, J. Gust Zook, Michael Reilly, Dr. M. L. Herr and Dr. Henry Yeagley. The Pennsylvania Traction Company now holds charters for these roads, but some legal questions having grown out of a recent decision of the Supreme Court preventing traction companies from building lines of railway connecting country towns, it was decided to apply for charters under the general railroad act of 1868.—A reorganization of the Cumberland Valley Traction Company has taken place. The new board of directors includes George W. Cumbler, B. F. Meyers, F. H. Alleman, W. K. Meyers, Luther Gorgas. Mr. Cumbler is president and Mr. Gorgas secretary and treasurer. It is expected that the extension of the line up the Cumberland Valley will be pushed along.

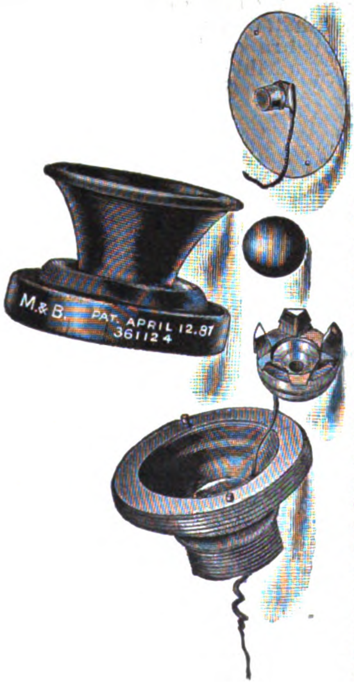
THE TELEPHONE WORLD.

United States Telephone Construction Co.

The United States Telephone Construction Company recently gave an exhibition to the press in the Bullitt Building, Philadelphia, of their various types of instruments for exchange work, private houses, factories, etc., in connection with the switchboard for exchange work manufactured under the Gould-Smith patents by the Eastern Electrical Manufacturing Company. There are a good many patents on switchboards owned by the Bell Co., and this switchboard is claimed to be the only one yet produced which is suitable for large or small exchanges, containing no infringing devices and being superior in every way to those in common use by the Bell Co. A distinct feature of the switchboard is the absolute secrecy in conversation between subscribers, the operator being entirely out of the circuit if two subscribers are connected; another feature is the entire freedom from danger from fires, the terminals in the switchboard automatically opening the moment strong currents get on to the circuits. Still another feature is the ease with which new subscribers can be connected up in the switchboard.

STYLE D—M. & B. TELEPHONE.

One of the accompanying cuts shows the M. & B. Transmitter dismantled. The diaphragm is of highly resonant material, which gives great efficiency. Attached to the center of this diaphragm is a small metal cup holding a carbon or other suitable point. In the back of the black rubber shell is a basket or runway of aluminum or other metal. The sphere, shown in the cut, which may be of carbon or other material, is eleven-sixteenths of an inch in diameter and lies in the basket or runway, which is so constructed that the sphere always rests on a plane that inclines towards the diaphragm. When these parts are assembled the point on the diaphragm comes about on a level with the center of the sphere, which, owing to the angle of the side of the basket, is normally kept against this point by gravity. The distance between the point on the diaphragm and the back of the basket is about three-quarters of an inch, which allows the sphere a maximum movement of a little under one-sixteenth of an inch. With every vibration of the diaphragm a movement of this sphere takes place which varies the battery circuit. The transmitter, as will be seen from this description, is novel in every detail. The makers claim superiority for the transmitter in the following points: Better articulation, greater volume of sound, capability for long distance transmission and simplicity of construction.



M. & B. TRANSMITTER DISMANTLED.

They also exhibited a novel toll line metallic circuit switchboard which is operated without cords or plugs.

Telephone and Telegraph.

The Conway Telephone Company, of Conway, Taylor County, Ia., has been incorporated with a capital stock of $5,000. Arthur Hayme and Miles H. Simmons are the incorporators.

A telephone company operating at Lenox and Clearfield, Ia., has been granted right of way into Creston. This makes the fourth company that has been given the right to enter Creston, and telephone competition promises to be lively.

Some people who are inclined to patronize independent telephone companies imagine they cannot get the long distance telephone service without paying double what they would to the Bell companies. This is incorrect as the interstate commerce law forbids any discrimination.

In St. Louis a number of the church organizations have recommended the passage of a city ordinance making it a misdemeanor to supply telephone service to immoral resorts.

The city council of Port Huron, Mich., has ordered the Bell telephones taken out of all city offices and have Harrison telephones substituted. The causes leading up to this action are the alleged methods made use of by the Bell company to freeze out the Harrison company. The right of the Bell company to occupy the streets of Port Huron will also be investigated by the city attorney.

The Creede-Bachelor Telephone Company of Creede, Col., has been granted an exclusive franchise in Creede for 10 years. As W. C. Munsell, who also applied for a franchise, holds an exclusive franchise for the town of Bachelor, there must be an arrangement between the two concerns before Creede and Bachelor can be telephonically connected.

There was a report current in New York last week to the effect that the new Standard Telephone Company had made an offer of $15,000,000 for the plant of the Postal Telegraph Company and that the bid was rejected because the owners of the Postal did not care to part with the property. The report has been both denied and affirmed by men supposed to know the facts.

The Bell telephones have been removed from all the offices of the Interior and Agricultural Departments and the Pension Office at Washington, and have been replaced by those of the Western Telephone Construction Company. Mr. J. E. Keelyn, a member of that company, has been making estimates on the cost of establishing a new telephone exchange in Washington.

In Detroit, Mich., the council committee on streets have agreed to report back the ordinances granting franchises to the Harrison Telephone Company and the Brown Loud-Speaking Company. Ordinances giving these companies franchises recently passed the council; a motion to reconsider was carried, and the franchises were resubmitted to the committee for amendment. These amendments have been made after consultation with the representatives of the companies, who have accepted them.

The board of directors of the Electric Messenger Company have formally accepted the conditions of the ordinance passed by the Pittsburg, Pa., councils granting to the company the franchise of the streets. The company was recently organized to compete with the Bell Company in Pittsburg, and proposes to supply a service and offer rates that will encourage patronage. A director of the company states that the company will get to work within a very short time. The financial matters necessary to construct the system have been arranged, and the company hopes soon to be soliciting contracts for instruments.

The Commercial Telephone Company have applied for a franchise at Oakland, Cal., and a resolution has been prepared for the action of the council in which the terms of the franchise are embodied. The resolution requires the new company to put up a certified check for $5,000, payable to the city clerk, at the time their bid for the franchise is filed. They are also required to furnish a good and sufficient bond for the sum of $20,000 to assure the council that they will in a certain time build 10 miles of line. They are likewise required to protect the city from any suits for infringement. The company fear no trouble as regards the patents of their instruments for they claim that they are not infringements on any of the other telephones.

The new law in regard to the maintenance of secrecy by telephone employees as to messages passing over the wires will come into operation September 1. It requires the staff of telephone companies to be as secretive regarding the nature of their business as are the men and women who handle telegraphic messages. A person who either wrongfully obtains or attempts to obtain any knowledge of a telegraphic or telephonic message by connivance with a clerk, operator, messenger or other employee of a telegraph or telephone company, or, being such operator or other employee, willfully divulges to any one but the person for whom it was intended the contents or the nature of a telegraphic or telephonic message intrusted to him for transmission or delivery, or of which contents he may in anyway have become possessed, is punishable by a fine of $1,000 or six months' imprisonment, or both. The same penalty attaches to neglect or refusal to transmit or deliver messages, except when they are intended for illegal purposes.

The Washington (D. C.) *Times* of the 4th inst. describes a test of the telephones in the Interior Department lately put in by the Western Telephone Construction Company of Chicago. It says: "The new granular-carbon microphone, designed by J. E. Keelyn, of the Western Telephone Construction Company, demonstrated the wonderful sensitiveness of the telephone. One instrument was placed near the F street entrance and connection made to the switchboard located in the basement, and hence to another telephone. A gentleman then whispered into the transmitter of the first mentioned telephone, the whisper being perfectly audible. Then the gentleman proceeded to move away from the telephone step by step, talking as he moved. He walked out from the lobby to the main corridor, to the Seventh street corridor and along the latter until opposite the superintendent's room, which is distant half the length of the building. At this point, about 500 feet distant from the telephone, his voice was plainly taken up by the instrument and transmitted to the listener at the other end of the line. The line of sound had to take the three angles of the corridors. This is the most remarkable result in telephony ever effected."

"The Car-Buyer's Helper."

This is the title of a very handsome trade-book, published by the Brownell Car Company of St. Louis, which gives in narrative style a thorough analysis of the street car from the beginning to the end of its construction, pointing out briefly but clearly those details which thought and experience have taught the expert to examine when called upon to give his opinion as to the material, strength, solidity and adaptability of everything that goes into the manufacture of an electric or cable car. The book is written in a style that makes it positively interesting to the ordinary reader, and to those who are seeking information on the subjects of which it treats it must seem an admirable instructor, at once practical and entertaining. There are a number of illustrations in the book of those parts of a car which need the aid of an engraving to better the understanding, and marginal side notes enable the reader to find at a glance the points he is seeking; there is also an index. We commend "The Car-Buyer's Helper" to all street railroad men.

Metropolitan Electric Company.

Business with the Metropolitan Electric Company, 186-198 Fifth avenue, Chicago, in the Fan Motor line is on the increase; they say they are doing a better business in this line than they have ever done before.

Their Metropolitan Incandescent Lamp is giving excellent satisfaction and they are making large sales constantly.

In this issue please note the great reudction which the Metropolitan Electric Company have made in the price of 12-inch Alternating Fan Motors. They report but a few left and request that orders be sent in at once.

COMMERCIAL PARAGRAPHS.

The De La Vergne Refrigerating Company have entered the Oil Engine field and have selected the Hornsby-Akroyd type, which is well known abroad. The headquarters of the company are at 138th street and East River, New York.

The Selle Gear Company of Akron, O., have purchased the manufacturing rights for the Replogle Water Wheel Governor and will at once place the device on the market. This is one of the inventions of Mr. Mark A. Replogle, who will remove to Akron.

The American Gas Engine Company, Chicago, issue a well written "Treatise on Gas Engines and Electric Power Up to Date," which is well worth reading and will be mailed upon request.

The Electrical Subway Commission of Baltimore has awarded the contract for the laying of new conduits to the National Conduit Company of New York. The amount involved is about $70,000.

Queen & Company of Philadelphia have secured the right to the Wirt switchboard instruments, and they will manufacture these instruments in the future. Mr. Wirt, who has removed from Chicago to Philadelphia, is manufacturing his "non-sparking" dynamo brush, and will shortly bring out a new brush intended for motors and dynamos which are required to run with almost no attention.

The Falls Rivet and Machine Company have secured the contract for the power transmitting machinery which will be required by the Diamond Match Company in equipping their large match factory now building at Liverpool, England. The order consists of shafting, ring oiling bearings, friction clutches, steel rim pulleys, gears, etc., and the company are very much elated over their good fortune in securing such an order, as they are confident the equipping of a factory of this size in that locality with American machinery will be of considerable benefit to them. They have already fitted up several factories in this country for the above company, and the present order demonstrates the fact that the material furnished has given perfect satisfaction.

The Ohio Brass Company.

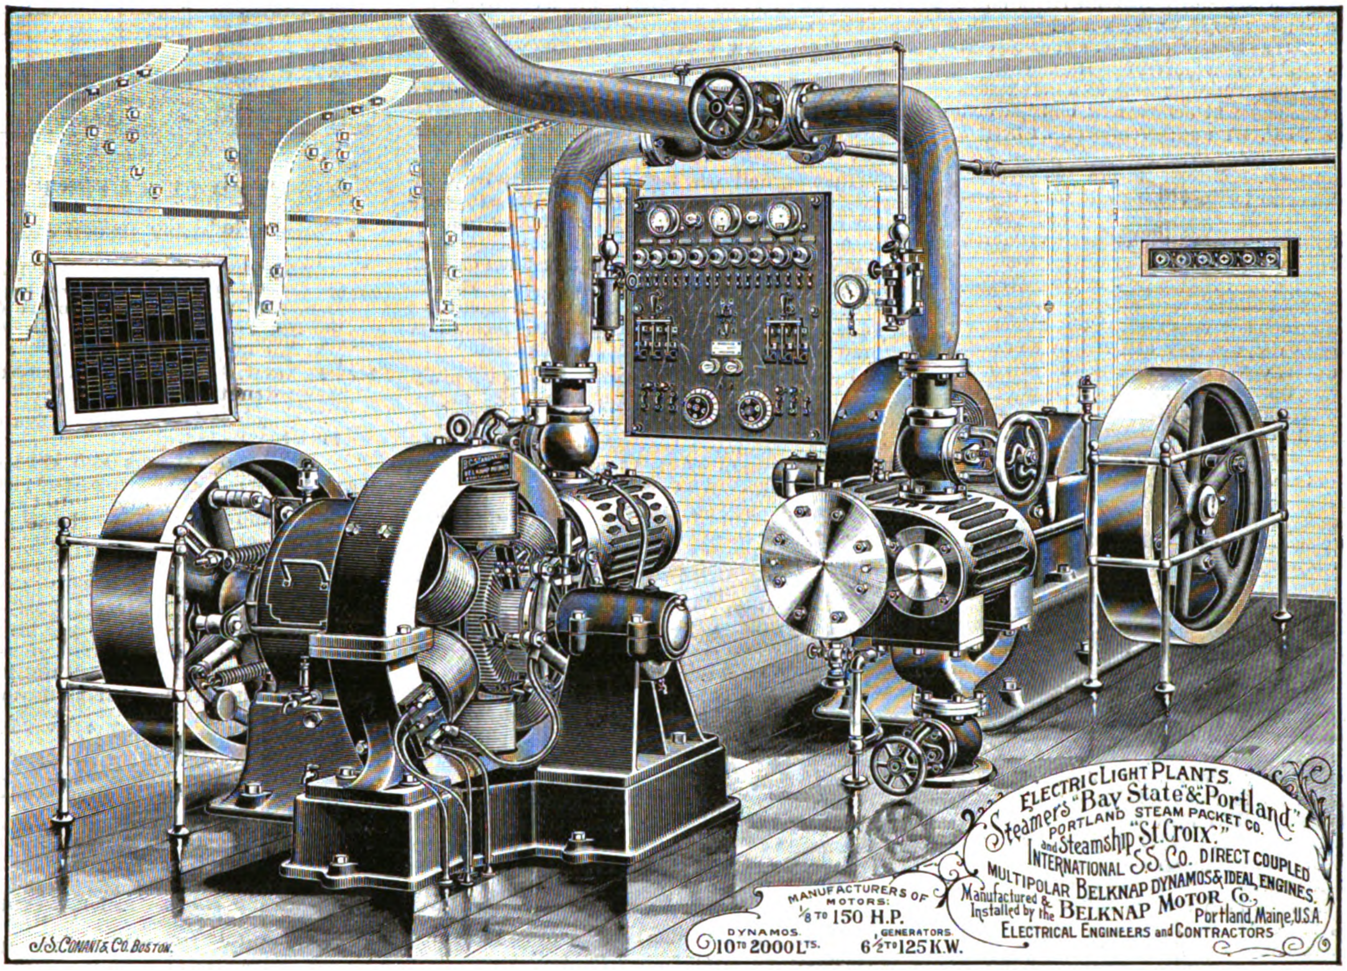
The Ohio Brass Company of Mansfield, Ohio, presents in its illustrated Catalogue, No. 3, a book that should have a place on the desk of every dealer in electric railway supplies. There are 140 pages between the handsome covers, and nearly every page has one or more engravings of articles dealt in by the company, with concise descriptions and prices appended. There are also an alphabetical index and other features that render it a convenient and useful guide to purchasers.

Electric Light Plant, Steamer, "Bay State."

Accompanying this is a cut illustrating the electric light plant on the new steamer "Bay State," of the Boston and Portland line, recently installed by the Belknap Motor Company of Portland, Maine. The engines used are the "Ideal." The dynamos are multipolar slow speed machines of 400 lights capacity each, but either machine will carry the entire load amounting to 540 lights. It has become a general practice to use duplicate plants for marine work so in case an accident should happen to either engine or dynamo the duplicate machine can do the work. The dynamos were designed by Mr. W. H. Chapman, electrician for the company. This plant does great credit to the company and has induced further orders for the installation of two direct coupled machines for the steamer "Portland" of the same line, also for the steamship "St. Croix" of the International Steamship Company, which is practically under the same board of management. The system of wiring is most excellent. There are eight main circuits controlled at the switchboard in the dynamo room which lead to sixteen different distributing boxes containing switches located in different parts of the boat, each switch controlling six lights, turning them on or off as may be desired. These distributing boxes have glass fronts secured with lock and key, and are under control of the steward of the boat. There are pilot lights on main and fore rigging and at the bows of the boat.

The fixtures are of the latest design, with opalescent globes and shades. The dining saloon is fitted with ground glass globes which give this part of the boat a very cheery and pleasing effect. The freight deck lights are protected with guarded fixtures.

The boat at night presents a brilliant spectacle, being a veritable floating palace and surpassing in all its appointments anything that can be found in Eastern waters, the Sound lines alone excepted. The addition of this new boat has been the means of popularizing this line with the best class of the traveling public.



ELECTRIC LIGHT PLANTS.
Steamers "Bay State" & "Portland."
PORTLAND STEAM PACKET CO.
and Steamship "St. Croix."
INTERNATIONAL S.S. Co.
DIRECT COUPLED MULTIPOLAR BELKNAP DYNAMOS & IDEAL ENGINES.
Manufactured & Installed by the BELKNAP MOTOR Co.,
Portland, Maine, U.S.A.
ELECTRICAL ENGINEERS and CONTRACTORS
MANUFACTURERS OF MOTORS: 1/8 TO 150 H.P.
DYNAMOS 10 TO 2000 LTS.
GENERATORS 6½ TO 125 K.W.
J.S. CONANT & CO. BOSTON.

TEST OF OKONITE WIRE.

Extracts from Report of Dr. J. A. Fleming, F.R.S., Professor of Electrical Engineering in University College, London.

December, 1894.

To Messrs. Laing, Wharton & Down,
62a New Bond Street, W., London.

The cables sent to me were in large coils of about half lengths, and came just as they were forwarded by the makers.

I have found in this Okonite Cable a very marked increase of insulation resistance with time of charging, and have therefore given all the results in the form of curves on a chart appended to this report, in which the insulation resistance of the samples is shown in megohms per mile of cable after one to five minutes' charging.

My opinion of these cables is, therefore, that the Okonite material is a remarkably good insulator, and that the samples of Okonite Cable submitted to me represent a very high degree of excellence in the manufacture of insulated cable. I do not lay much stress on mere megohms per mile in a cable. The real practical test of a cable is the electrical pressure it will withstand after prolonged soaking in water and such general rough usage as the cable will experience in actual handling. In order to test the mechanical toughness of the Okonite material, I bent and kinked several samples at such sharp angles as to break the copper strand inside the Okonite insulation. This mechanical toughness combined with its flexibility is a great point in its favor.

I consider that this Okonite Cable is a very excellent and high class cable for all outdoor, overhead, or underground electrical work, with high electric pressures, whether alternating or continuous.

I regard it also as an excellent material for indoor wiring work in cases in which the conductors are necessarily exposed to moisture and under conditions in which a very large factor of safety must be employed. The standard copper conductor, being tinned and twisted, was not in a form suitable for a very accurate test of the copper conductivity, but the figures given for the resistance per mile of the coils A, B and C, show that the copper employed is not less than 98 per cent conductivity in all probability.

I consider that the behavior of these samples of Okonite Cables places it in the front rank as a class of cable for electric lighting and transmission work.

February 1 , 1895.

The next question to which I have directed my attention is the power of the Okonite material to withstand the action of chemical agents. For this purpose fair samples of the Okonite cables were put to soak on January 12, 1895, in the following chemical solutions:

(a) was put into strong salt and water.
(b) " " " paraffin oil.
(c) " " " linseed oil.
(d) " " " caustic soda solution.
(e) " " " dilute sulphuric acid, 1 : 10, or battery acid.

These samples were left soaking in these solutions until February 15, or for thirty-four days. They were then tested for insulation at 100 volts, and found to be in excellent condition.

The samples were then submitted to the electric pressure test, the pressure being taken up to 3,360 volts by the use of an alternating current having a mean pressure of 2,400 volts, and all of these showed no signs of failure when exposed to this pressure for five minutes.

This forms an exceedingly severe test of the high insulating quality of Okonite, that after this soaking in oils, brine, acids and alkali for more than a month all the samples withstood a 2,400 alternating pressure perfectly.

I have no hesitation therefore in saying that I think the Okonite insulation is a remarkably fine insulating material, and one which by its electrical and mechanical qualities is well fitted for use in electric cables for high or low pressures. I have not found that the severe cold of the last month has rendered it at all brittle. I am, etc.

(Signed) J. A. Fleming.

BUSINESS HINTS.

Public Buildings, Theaters, Residences, &c., Proposed or in Course of Construction.

[The following summary is prepared weekly for ELECTRICITY for the information of advertisers and readers who are dealers in apparatus and articles required in the electrical equipment of public and private buildings.]

Baltimore.—The American Title Insurance and Trust Company have purchased a site for an office building on North Calvert st., near Lexington.

Buffalo, N. Y.—Two additional wings will be added to the city hall at a cost of $400 000.. .The new Athletic Club have decided to build a handsome club house at a cost of $80 000 ; Architects Green & Wicks.

Cincinnati, O.—The Burnet Hotel Company will erect a sixteen story and basement building at a cost of $600.000 : ornamental galvanized and electrovanized iron and steel work ; freight and passenger elevators. electric lighting, fire escapes, etc.; Architects Adler & Sullivan, Auditorium Tower, Chicago, Ill.

Green Bay, Wis.—Wilhelm Griesser, 907 Randolph st., Chicago, Ill., will erect a $20,000 opera house in this city.

Huntington, W. Va.—F. F. McCullough, county clerk, will furnish information respecting the new court house building ; it will be lighted by gas and electricity.

Jersey City, N. J.—The Hudson County Caledonian Club will erect a clubhouse, with a hall for entertainments.

Milwaukee, Wis.—The Bohemian American Hall Association and Stock Company will build a new hall and club house on 12th st., cor. Wine st.; Architects Wiskocil & Schutz.

New Orleans, La.—B. Nazereau Reynes has prepared plans for an opera house for Louis Gunewald Sons ; lighted by electricity.

New York City.—The corporation of Trinity Church 187 Fulton st., will erect an eight story brick warehouse, cor. Varick and Spring sts.; Architect Charles C. Haight, 111 Broadway....Flora Sawyer will erect a seven story and basement store and loft building at 79-83 Wooster st., to be equipped with passenger and freight elevators, electrical apparatus, etc.; Frank E. Smith contractor.... F. P. Dinkelberg, 3 Union square, West, will make plans for a seven story mercantile building at Bleecker & Wooster sts....Architect George F Pelham, 503 5th ave., has prepared plans for a seven story warehouse, to be built at 197 South 5th ave.; steam heating appliances and elevator, electric wiring and all conveniences are to be introduced. ....Terence J. Duffy, 2[illegible]5 West 71st st., will erect an eight story brick store on south side of 32d st., west of 6th ave. ....Clarence S. Wadsworth, of Middletown, Conn., will erect a ten story brick store and office building at 41 East 17th st....Samuel Inslee, has deeded to the Y. M. C. A. the property 4[illegible] Broadway, valued at $200,000 ; two buildings will be erected....George J. Kraus, 217 West 48th st., will build two buildings, amusement house, etc., north side of 29th st., west of Broadway....John Baudouine, 936 Broadway, will erect a ten story office building on the site of the Brower House, now demolished....Henry F. Cook, 59 West 76th st., will build 8 four story dwellings, north side of 69th st., west of Central Park West.... John O. Barker, of Newark, will build 5 four and a half story dwellings, north side of 85th st., east of West End ave....Margaret A. McCaffrey will erect a five story flat and store, cor. of St. Nicholas ave. and 134th st.; Architect John C. Burne, 101 West 42d st....Charles A. Bailey will erect 8 five story flats on 111th st, west of 8th ave.; Architects Neville & Bagge, 215 West 125th st....W. H. Bingham, Elmford Park, Westchester County, will erect 2 five story flats, north side of 119th st., west of Park ave....Grumm & Grant, 471 Amsterdam ave., will erect 3 five story flats on southeast cor. of 107th st. and Amsterdam ave.; Architect Henry Anderson, 1180 Broadway.

Olympia, Wash.—Architect Ernest Flagg, 54 Broad st., New York, has prepared plans for the new State capitol building to be erected here.

Paterson, N. J.—The Passaic County board of chosen freeholders have decided to build a new court house at a cost of $200,000.

Philadelphia.—The county board of the Ancient Order of Hibernians intend to erect a club house at 213 South 8th st ..Rankin & Kellogg have completed plans for a parish building for the parish of St. James, at 38th st. and Market st.; the basement will contain heating and lighting plant and the building will have a gymnasium, etc....A seven story and basement office building is to be erected for Joseph R. Teller at 14 South 4th st....Hall & Ballinger are preparing plans for a five story and basement factory building for Wm. T. Datz & Bro., to be erected at 237-289 North 6th st.; two 75 horse-power boilers, engines, electric light plant, etc.

Reading, Pa.—A meeting of the trustees of all the Masonic lodges in this city was recently held to consider the best methods and plans for erecting a Masonic Hall building in Reading. It is said that some Philadelphia capitalists are interested in the project and it is proposed to erect a building on North 6th st., which will cost $500,000. ....E. Miltimore Morgan has let the contract for the rebuilding of the Mansion House to L. H. Focht.

Tampa, Fla.—A company has been organized to build a $200,000 hotel here, and specifications are now being drawn.

INCORPORATIONS.

The Chicago Western Electric Street Railway Company, Chicago—to operate electric street railways in Cook, Du Page, Lake, Will and Kane Counties, Ill. Capital stock, $5,000,000. Incorporators: Henry D. Beam, Maier Rosenthal, Harlan W. Cooley.

The Electric Railway Construction and Manufacturing Company, Chicago—to build electrical railways, light, heat and power plants. Capital stock, $250.000. Incorporators: John W. Jones, William Riley and Sterling P. Railey.

The Cycle Electric Light Company, Chicago—to manufacture electrical appliances. Capital stock, $100,000. Incorporators: W. A. Crowdus, John Zimmerman, and John D. Thompson.

The Oregon Electric Light and Power Company, Oregon. Ill. Capital stock, $50,000. Incorporators: Albert H. Knodle, William L. Taylor and Lee Allen.

The Champaign and Urbana Phœnix Telephone Company, Champaign, Ill. Capital stock, $40,000. Incorporators: P. S. Replogle, E. Frank Replogle and Jacob Frankel.

The Economy Electric Lighting Company, Geneva, Ohio. Capital stock, $12,000. Incorporators: J. A. Carter, C. H. Munger, Lucien Seymour, C. I. Chamberlin, A. W. Chamberlin.

The Chicago Electric Street Railway Company, Chicago—to construct and operate street railroads. Capital stock, $5,000, 00. Incorporators: Sherman D. Purnia, John Parrott, O. W. Larson.

The Pittsburg, Sheraden and Carnegie Traction Company has been granted a charter by the State Department at Harrisburg, Pa., to build an electric line from the river road in Esplen borough, Allegheny County, to Sheraden, thence to Crafton and Carnegie, a distance of seven miles. The company is capitalized at $42,000. The officers are: President, Harding Kimberland, Sheradenville; directors, Henry J. Wenke, Miller Elliott, Richard B. Scandrett, Pittsburg; D. H. Ferrell, Sheradenville.

The Patterson Heights Street Railway Company, Beaver Falls, Pa.—to build a short electric line. Capital stock, $6,000. President, John Reeves, Beaver Falls; directors, Henry M. Myers, John T. Reeves, Patterson township, Beaver County; Harry W. Reeves, John Reeves, James F. Merriman, Beaver Falls.

The North Trumbull Rapid Transit Company, Kinsman, Ohio—to operate an electric railroad. Capital stock, $10,000. Promoters: James A. Russell, H. L. Perkins, E. N. Yeomans, R. B. Barnes, Geo. E Haine, R. T. Millikin.

The Little Saw Mill Run Street Railway Company, Pittsburg, Pa.—to build an electric street railway in Pittsburg. Capital stock, $36,000. Promoters: M. P. Howley, Geo. W Lewis, Pittsburg; Jonathan Barrett, Allegheny.

The Klamath Falls Light and Water Company, Klamath Falls, Ore.—to furnish electric light service, telephone and a water system for town of Klamarth. Capital stock, $2,000. Promoters: Chas. S. Moore, Geo. T. Baldwin, H.V. Gates.

The Santa Barbara Consolidated Electricity Company, Santa Barbara, Cal.—to acquire, construct and maintain street railways in Santa Barbara County; electricity, cable, gas, or water power, etc. Capital stock, $200,000; Promoters: A. Hope Doly, N. E. Ashton, B. S. Hayne, Santa Barbara.

The Electric Transportation Company, Jersey City, N.J. —to manufacture, purchase and sell electric and other boats to engage in inland navigation. Capital stock, $[illegible]5,000. Promoters: Frank Ribbett, Rahway, N. J.; Samuel D. Collett, Brooklyn, N. Y.; Edw. B. McCleas, Geo. F. Evans, Chas. E. Ainsworth, Jersey City.

The Grand Boulevard Street Railway Company, Philadelphia—to engage in the conveyance of passengers by electric power. Capital stock, $50,000. Promoters: O. M. Thomson, Chas. P. Horr, John McLennon, Thos. C. McConnell, Philadelphia.

The Beacon Lamp Company, Portland, Maine—to manufacture and deal in electric and other machines. Capital stock, $500,000. Promoters: Chas. Shoninger, Tabian Sachs, Leopold Tossbach, New York City; Isaac Weil, Boston, Mass.

The Amplified Electric Company, East St. Louis, Ill.—to acquire, own or use patent rights for electric devices or machines, and to manufacture or sell electrical devices or machines of every sort. Capital stock, $1,000,000. Promoters: Fred'k Ulrich, Edwin J. Paule, John T. Dodwell.

The Defiance Light and Fuel Company, Defiance, Ohio—to operate gas and electric light plants. Capital stock, $30,000. Promoters: Walter R. Faben, Jas. W. R. Cline, Wm. Robt. Morrison, Oscar T. Martin, John S. Shewalter.

The Elliott Magnetic Electric Company, Chicago. Capital stock, $1,000,000. Incorporators: Wm. R. Elliott and Isaac C. Robbins.

The Electric Street Railway Company, Niagara Falls, Ont. Capital stock, $125,000. Incorporators: Alexander Manning, Hume Blake, C. A. Laish, P. A. Manning, Toronto; Charles Black, Welland.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED JULY 9, 1895.

ELECTRIC RAILWAYS AND APPLIANCES.

542,228. Trolley-Breaker. Henry P. Ball and Charles A. Lieb, New York, assignors to the General Electric Company. Schenectady, N. Y. Filed Aug. 8, 1894.

542,434. Underground Trolley. Leedham Binns, Philadelphia, Pa. Filed April 11, 1894.

542,512. Electric-Railway System. Robert B. Wilson, Cincinnati, Ohio, assignor of one-half to Jeremiah M. Wilson, Washington, D. C. Filed Jan. 2, 1894.

542,591. Trolley-Finder. Charles C. Lynde, Buffalo, N. Y. Filed Nov. 28, 1894.

ELECTRIC LIGHTS AND APPLIANCES.

542,279. Arc-Light Support. Barton Pickering, Dayton, Ohio. Filed Nov. 15, 1890.

542,490. Electric-Arc Lamp. Samuel E. Nutting, Oak Park, assignor to George W. Furbeck and Joseph Kettlestrings, Chicago, Ill. Filed Sept. 8, 1894.

542,50[illegible]. Arc Lamp. Albert C. Seibold, Mount Vernon, assignor of one-third to Edgar O. Clark and William Sowdon, New York, N. Y. Filed Jan. 7, 1895.

542,589. Electric-Arc Lamp. Frank M. Hildebrandt, Edwin S. Hildebrandt and Henry F. Hildebrandt, Baltimore, Md. Filed Dec. 27, 18[illegible].

DYNAMO ELECTRIC MACHINERY.

542,295 Transformer for Alternating-Current Systems. Elihu Thomson, Swampscott, Mass., assignor to the General Electric Company of New York. Filed March 6, 1895.

542,487. Electric-Lighting System and Dynamo Therefor. Morris Moskowitz, Newark, N. J., assignor to the National Electric Car Lighting Company of West Virginia. Filed May 11, 1895.

542,548. Electrically-Controlled Motor. George L Thomas, Brooklyn, N. Y. Filed April 25, 1895.

BATTERIES.

542,259. Electric Battery and Application Thereof to Medicinal Purposes. Seth R. Beckwith, Orange, N. J. Filed April 3, 1895.

TELEPHONE AND TELEGRAPH APPARATUS.

542,249. Telephone-Switchboard. James F. Gilliland, Adrian, Mich., assignor to the Gilliland Electric Company, same place. Filed Oct. 26, 1894.

542,262. Multiple Switchboard for Telephone-Exchanges. Milo G. Kellogg, Chicago, Ill. Filed Dec. 21, 1889.

542,454. Telephonic Transmitter. Charles C. Hughes, Baltimore, Md. Filed Sept. 12, 1894.

MISCELLANEOUS.

542,240. Electric Meter. Frank P. Cox, Lynn, Mass., assignor to the General Electric Company of New York. Filed Feb. 15, 1895.

542,258. Electrical Measuring-Instrument. Frank Holden, Schenectady, N. Y., assignor, by mesne assignments, to the General Electric Company, same place. Filed Jan. 22, 1895.

542,268. Electroprotective System for Locks. Morris Martin, Malden, Mass., assignor of one-half to Benjamin W. Wells, Boston, Mass. Filed Oct. 4, 1894.

542,309. Electric Brake. William B. Potter, Schenectady, N. Y., assignor to the General Electric Company of New York. Filed March 20, 1895.

542,406. Electric-Alarm-Gage. William H. Bradt, Troy, N. Y. Filed Feb. 2[illegible], 189[illegible]. Renewed May 8, 1895.

542,462. Electric-Insulating Material. James O. Brown, Chicago, Ill. Filed May 5, 1894.

542,471. Electric-Bath Apparatus. William E. Golden, Auburndale, Ohio. Filed March 5, 1895.

542,[illegible]08. Medical Electrode. Andrew P. Van Tuyl, Jr., Brooklyn, N. Y., assignor to himself and Edward C. Park, same place. Filed May 15, 1895.

542,550. Railway Block-Signal System. George M. Brown, Galesburg, Ill., assignor of one-half to J. J. McKee, Bethlehem, Pa. Filed May 4, 1895.

542,[illegible]65. Press for Making Screw-Insulators. Seraphin Kribs, Brooklyn, assignor to William Brookfield, New York, N. Y. Filed July 5, 1894.

RE-ISSUE.

11,503. Automatic Electric Weighing-Scale. Charles F. Wood, Richmond, Va. Filed Jan. 29, 1894. Original No. 500,045, dated June 20, 1893.

ELECTRICITY.

VOL. IX. NEW YORK, JULY 24, 1895. No. 2

ELECTRICITY

Published every Wednesday by the

ELECTRICITY NEWSPAPER CO.

B. E. GREENE, PRES'T. L. J. MONTGOMERY, SEC'Y.

PUBLICATION OFFICE:

6 Park Place - New York

EDITORS: NELSON W. PERRY.
BURTON E. GREENE.
R. H. WILLOUGHBY.

BUSINESS MANAGER, - - JOHN L. GANS.

SUBSCRIPTION RATES:

UNITED STATES, - - - - $2.50
IN CLUBS OF FIVE OR MORE, - - - - - $2.00
FOREIGN COUNTRIES, - - - - - - $4.50
SINGLE COPIES, - - - - - - - 10 CENTS

ADVERTISING RATES:

As ELECTRICITY reaches all classes interested in electrical work, its value as an advertising medium can be readily appreciated. Rates will be sent on application.

Changes for advertisements should reach the office not later than the Saturday preceding the date of publication.

ENTERED AT THE N. Y. POST OFFICE AS MAIL MATTER OF THE SECOND-CLASS.

TRADE SUPPLIED BY
THE AMERICAN NEWS COMPANY,
THE WESTERN NEWS COMPANY,
And their Agencies in all Principal Cities.

EDITORIAL NOTES.

There are still left in this trade a large number of men who have entered into it for their life work. They may be disheartened, but they have not given up. It is for them that we write. To them we present our argument, and to them we must all look for the re-establishment of business principles, the reinforcement of the doctrines of common sense.

It is for these men to consider just why wrong has temporarily triumphed over right, why it was possible for the tricksters and adventurers to bring the industry to its present condition.

And when these questions receive careful thought the only answer possible is that the electrical press has not done its duty.

If the "Electrical Engineer," the "Electrical World," the "Electrical Review" and the "Western Electrician" had faithfully done their duty by the trade they claim to represent, whose best interests they claim to guard, the present situation would never have confronted us.—"ELECTRICITY," June 5, 1895.

Signs of the Times. The great desideratum, from a sanitary standpoint at least, of the abolishment of horses from our thoroughfares has been demonstrated by the all but universal substitution in many American cities of the electrically-propelled street car for that drawn by horses. In making this change America has led the world, but our neighbors across the water seem to have taken the lead in extending the *automobile* idea to private vehicles. France took the initiative in the encouragement of this line of invention, and some time ago offered seven prizes, aggregating $10,000, for the best self-propelled vehicle. These were competed for on June 11 last. The distance traversed was from Paris to Bordeaux and back, or 744 miles. The number entered for the contest—16 petroleum carriages, 7 steam vehicles, 2 electric carriages and 2 petroleum bicycles—evidenced the interest manifested by the inventive public in this line of development. Electricity made no showing in the final results, since all of the seven prizes were won by petroleum motors. Now England is going to have a similar competition, and *Engineering* (London) has offered 1,000 guineas (about $5,130) to be competed for under conditions which will be announced later. It is to be hoped that in this latter competition electricity will make a better showing than it did in the former. America is also to have a contest of its own, the *Times-Herald* of Chicago having offered a series of prizes aggregating $5,000 for a run between Chicago and Milwaukee next November. The full text of the regulations is not yet printed, and we hope the report that the first and second prizes are not open for the competition of foreigners is unfounded. There should be no such restrictions. In the interest of progress any man with a horseless vehicle, wherever he may hail from, should be allowed to win the biggest prize if he is able. We hope this restriction will be removed, and believe that the proverbial indomitable Yankee inventive faculty will yet solve the electrical problem which the French tournament showed conclusively has not yet been solved abroad. We scout the idea that any country in the world can beat us at anything.

Electricity for *automobile* purposes is, in the present state of the art, greatly handicapped by the great weight inefficiency of the storage battery. We have faith, however, that some means will yet be devised whereby this weight efficiency may be so far increased as to place the storage battery more nearly on a par with fuel storage. When this occurs, not only will the question of self-propelled vehicles be commercially solved, but many other questions of even vastly more importance than this. The signs of the times point to an earnest grappling with the problem, and this can have but one ultimate result, viz., its solution.

* * *

Judge Dallas's Decision. The decision of Judge Dallas of the United States Circuit Court, Eastern District of Pennsylvania, which we printed in full last week, is one of unusual interest to the elevator industry at large and the electrical industry in particular. While the points at issue involve directly no electrical features, their indirect bearing will be made clear by a few words of explanation. With the old-style, slow-speed elevator the control was conveniently effected by means of a cable running through the cab. By pulling this in one or the other direction the proper valves were operated for starting, stopping and reversing the motion of the driving machinery. With the advent of the modern high-speed elevator such method of control became entirely inadequate and the Elevator Trust acquired almost a monopoly of controlling devices suitable for their higher speeds. In fact it has relied almost entirely upon these controlling patents for its maintenance of the monopoly which it hoped to establish. But an element it had not calculated on entered into the field at about this time, viz., the electric elevator, which could be controlled from the cab by simpler and more effective means than could the hydraulic elevator by the best mechanical appliances yet invented. The Trust's own patents did not cover electrical methods of control, and the possible electrical methods of control were so numerous that it was a hopeless undertaking to attempt to monopolize them all. Here was in fact a competitor which could not be controlled, and the other method remaining was to kill it. This latter is just what the Trust has been attempting to do, and in pursuance of this policy it has employed the dishonorable methods detailed in former issues of this paper. To crush out competition from outside hydraulic elevators its own controlling patents were used as a club, and suit after suit was brought for infringement. The Trust seems to have lost these suits pretty uniformly as fast as they came to trial, until in the present case at one fell swoop it lost four. Without these patents it seems probable that the Trust must go to pieces, as they constitute the "goodest things" possessed by the combination. The single suit which the Trust did win, that involving the validity of the Otis governor patent is an empty victory, since there are many other ways of governing the elevator besides the specific one patented by Otis. The Trust was denied an accounting, however, because the patented devices infringed were not marked "patented" as required by law. This is in fact a victory for the defence, since it has been the policy of the Trust to conceal as far as possible what they claimed as an infringement, as in the A. B. See case, but this decision will force them to declare themselves, so that the opposition may steer clear in future of patented features.

* * *

The Cost of Steam Power. One of the most appropriate papers read at the recent meeting of the Institute at Niagara Falls was that of Dr. Chas. E. Emery on "The Cost of Steam Power." It will be remembered that on March 21, 1893, the same author read a very elaborate paper on the same subject which has since been quoted by nearly every writer on the subject. In the earlier paper Dr. Emery confined himself to the cost of power as generated by different types of engines in units of 500 H. P.

With the approaching completion of the Niagara power plant, planned on a much larger scale, there naturally arose a desire on the part of the public to know how the cost of steam power generated on a similar scale would compare with the figures charged by the Niagara Power Company. It was to meet this desire that Dr. Emery's paper was undertaken. The discussion which followed, while in some cases misdirected through an apparent ignorance on the part of some of the participants, of the earlier paper, was exceedingly interesting and significant. The question seemed to be—not could the Niagara power be delivered at Buffalo at a figure to successfully compete with locally generated steam power, but *could it compete at Niagara Falls* with steam power generated on a similar scale? It was with no little personal gratification that ELECTRICITY noted the general consensus of opinion with the views advocated in the start in these columns, that the enormous fixed charges which the horse power must bear at Niagara until very nearly the ultimate capacity of the tunnel is utilized rendered commercial competition with steam exceedingly problematical. We know that we have taken the unpopular side of this question, for the public likes sensations and wants to believe that Niagara will eventually drive the machinery of New York, Boston and Chicago. We never have been able to convince ourselves, however, that the encouragement of hopes that can never be realized will result in good to anybody. Our contemporary, the *Electrical Engineer*, thinks differently, and nothing is too improbable for it to swallow. In this connection it is instructive to see how the *Engineer* regarded Dr. Emery's paper. In its editorial comments on the Niagara Falls meeting it says:

"Particularly apropos of the time and place of the meeting was Dr. Emery's paper on 'The Cost of Steam Power.' We have of late had so much wild talk on this question, especially in the vicinity of Buffalo, that a calm consideration of the subject by a competent and recognized authority must go far towards putting the quietus on many of the absurd statements and figures which have gained currency. If we read Dr. Emery's figures correctly, a 20,000 H. P. plant of the most modern construction cannot compete in cost of power delivered *at the engine shaft* with the price of electric power delivered *at the motor terminals*, as actually contracted for by the Niagara Falls Power Company."

The saving clause in this is the parenthetical one, "If we read Dr. Emery's figures correctly."

We wonder if any one else than the editors of the *Engineer* can find in Dr. Emery's paper any justification for its (the *Engineer's*) course in the matter of the Niagara-Buffalo transmission?

* * *

New Pin for the Institute. A movement took place at Niagara Falls to reconsider the design of the Institute pin, and this is one of the things which occurred at that time for which we should be truly thankful. The coffin-like design which now constitutes the official crest of the Institute is certainly not appropriate to this most lively of all sciences—electricity. In some respects the present pin is highly symbolical, but of death it certainly should not be. It is in fact open to the objection of being *too* symbolical—it is *bolical* all through, as its designers were careful to show on the presentation of their recommendation to the Institute. We will admit that it is "bolical," and that it is "bolical all through." The expression "all through" is tersely represented by the single Greek preposition "dia," and the force of the statement is not lessened by substituting this terse Greek expression for the longer English one, which would make it read "dia—bolical." Let us have a new design. It's a good idea. Push it along.

* * *

Indirect Electrolysis. In another column we print a translation from the French of Mr. E. Andreoli's paper on what he terms "Indirect Electrolysis." Doubtless the paper has suffered some, as regards lucidity, in the translation, but it lacks that fullness and completeness that would justify a criticism. As we understand Mr. Andreoli, he has observed a series of entirely new phenomena which are difficult to explain upon the accepted theories of electrolytic action. We hope to see later a fuller exposition of the phenomena, and would suggest that since the reactions involved are chemical, the author express them by chemical equations instead of by words, as this method will be less liable to misinterpretation than the one adopted. We withhold comment on Mr. Andreoli's paper until we receive a fuller explanation of what actually takes place.

* * *

Under a recent decision of the appraisers the duty on imported carbons for arc electric lights has been increased from 20 to 30 per cent. It is said New York importers are getting these carbons through the Custom House at the 20 per cent. rate.—*Chicago Tribune.*

AGENTS of foreign carbon makers who are undervaluing their carbons, thus enabling them to undersell their competitors, should be smoked out. American carbons can be made good enough for any purpose, and the American manufacturers should at least have a fair show.

* * *

Our Discontent.

(From the Athens [Ga.] Banner.)

ELECTRICITY is not content with relegating the horses to the pastures.

We do not care a fig what the horses do, but there are *men* who must be "relegated to the pastures."

Under the Searchlight.

Views and Opinions on Timely Topics.

FOUND.

After a Long Search the Alamo Electric Street Railway is Discovered.

In our table July 10 showing the condition of various electric street railway properties financed by the General Electric Company, we referred thus to the Alamo Electric Street Railway Company, $40,000 of stock of which is held as an asset by the G. E. Company, "Road not discovered." We had consulted all the records at hand, but had found no trace of this property.

At last the mystery is cleared away, and we owe an apology to some one, but we do not yet know to whom.

An authority on Texas street railway matters writes us as follows:

To the Editor of ELECTRICITY.

Dear Sir: The Alamo Electric Street Railway Company, San Antonio, Tex., was projected by Messrs. McCrillis and Shepard, of Denver, Col., and financed and built by the T.-H. Company. About three years ago it was sold at receiver's sale, and bought in by the General Electric Company for $25,000. Since that time it has been operated by the G. E. Company as the Citizens' Electric Power and Street Railway Company. It has always run at a loss.

The G. E. Company has up to date about $100,000 invested in this road. They have been offered $20,000 for the property, which is more than it will bring at any subsequent time. Yours truly, ——

July 9, 1895.

Thus it will be seen that the inference induced by our remarks was misleading. We thought the $40,000 item was simply worthless. This is incorrect. It is worse than worthless, having cost the G. E. Company $100,000.

We are glad to make the correction, as we would not knowingly do an injustice to anyone.

* * *

SOME time ago we referred to the windy schemes of Mr. Joseph H. Reall in connection with electric railway enterprises. Last week a receiver was appointed for one of the schemes, named the Central Jersey Traction Company, upon application of a contractor who had done $25,000 worth of work and received no pay except a note which went to protest. This is about what may be expected of any enterprise in which Mr. Reall is interested.

* * *

THE AIR LINE HAS COME TO GRIEF.

The 200-Miles-an-Hour Scheme Dissolves Into Thin Air.

Dr. Wellington Adams's Chicago and St. Louis Electric Railroad has collapsed. There is a "To Let" sign on the company's offices in the Women's Temple, Chicago, and sundry creditors are seeking for some one who will pay them. The only address of the defunct company is now care of the general delivery, St. Louis, Mo.

The above press dispatch has no doubt conveyed to several purchasers of bonds and stock of this enterprise the news that they have lost their money. It is only a month since Dr. Adams announced that $9,000,000 of money had been raised of the $10,000,000 needed, and that as "the bankers were under a constant daily forfeit to raise the balance, the ultimate success of the enterprise was assured."

The prospectus of this swindle was published as an advertisement in the *Electrical World* and several of our contemporaries in 1892, *and declined by* ELECTRICITY. It was a gem in its way, and some parts of it are worth reprinting:

"For the purpose of completing its roadbed the C. & St. L. E. R. Co. now offers for sale 50,000 shares of its capital stock at $6 per share, . . par value $10, and this is all of the stock that will be sold at this figure."

The company "has already acquired [illegible],000 acres of coal rights, . . and will own 9,000 additional acres before January 1, 1898."

"It owns the finest coal mine and brick and tile making plant in the State, which will be utilized as POWER STATION NUMBER ONE."

"It has already commenced the construction of motors."

"It will make the trip from St. Louis to Chicago in three hours."

"The price of the next issue of stock will be advanced to $7."

"CONSERVATIVE ESTIMATE OF YEARLY REVENUE.

Passenger business 600 per day at $5	$1,095,000
Mail "	300,000
Express "	500,000
Light and power distribution (5,000 h. p. at $200 per annum)	1,000,000
	$2,895,000
All operating expenses and fixed charges, including interest on $7,000,000 bonds	$870,000
Leaving	$2,025,000

of net earnings, or 29 per cent. on the capital stock."

The registrars, trustees, depositories, etc., were the Farmers' Loan and Trust Company of New York, the Atlas National Bank, Chicago, and the St. Louis National Bank. We wonder how the officers of these institutions now view their connection with the scheme.

In view of the severe criticisms we have made of our contemporaries for failure to perform their duty to the investing public or to their own trade, it is proper to call attention to the fact that not one American electrical journal save ELECTRICITY ever offered one word of criticism against this scheme. ELECTRICITY treated it properly from the date when Dr. Adams read his paper before the Electric Club.

Among other choice bits in the prospectus was this:

"It has made its surveys and established the permanent location of the road."

This "permanent location" has been kept from the public for three years, but the secret is now out—it is in a small box in the general delivery department of the St. Louis post office.

The episode now ended may seem to the superficial like a huge joke. It is nothing of the kind. Several hundred people who have bought stock and lost their money will forever associate all electrical investments with the great Chicago-St. Louis Air Line. And why should they not? For did not the *Electrical World*, the *Electrical Engineer*, the *Western Electrician*, the *Electrical Review*, all print the catchpenny advertisement and treat the whole scheme with the utmost seriousnesss?

Shame on you all, to thus lend your columns to assist a gross swindle for the consideration of $50 per page. Shame!

* * *

THE New York *Sun* and many other papers gave a conspicuous example of bad and silly journalism by printing what one P. J. Gibbons, of Syracuse, said about the electrical executions at Auburn prison. The officials of the prison have denied about every statement of alleged fact made by Gibbons, and we guess their denials must stand. Probably the *Sun* did not know that at the very time Dr. Gibbons was blowing so much wind through his own whiskers he was trying to sell in Rochester his patented apparatus for resuscitation, which he claims usurps the functions of the Almighty, and brings the dead back to life. The *Sun* should buy an electrical cat. Dr. P. J. Gibbons is *not*, we understand, a member of the Onondaga County Medical Society, and increases his practice by advertising in the local papers. He evidently knows a good deal more about making money than he does about electricity or executions.

* * *

IT is difficult to see what method of reasoning governs our Western friends in maintaining a Northwestern Electrical Association. The northwest although a big place, is not big enough to maintain an association of this kind which can be of much value to the community. The National Electric Light Association, whose president is a Chicago man this year, has open arms for all comers, and it seems to ELECTRICITY that every one interested in the welfare of the electric lighting business should join this association and make it as strong and as potent for great good as possible. The Northwestern Association should come in in a body.

GENERAL ELECTRIC'S FINANCING POLICY.

Northwest General Electric—The Scheme, the Companies Financed, the Facts and Figures from the Official Record.

HOW BONDS ARE MANUFACTURED FOR NEW ENGLAND INVESTORS.

CHAPTER II.

The Winona General Electrical Company.

In our last preceding issue we presented for the consideration of our readers a fairly comprehensive review of the method employed by the agents of the General Electric Company in financing the Winona General Electric Company, and the results thereof. We set forth the principal facts concerning the condition of the underlying companies on which that operation was based. But the space at our disposal would not permit us to deal with the matter as fully as should be done. We therefore resume the discussion, produce some further facts and present some additional conclusions drawn from a more detailed analysis of the official statements which we then published, thus furnishing more conclusive and convincing proof of the want of good faith on the part of everyone connected in any responsible way with the scheme.

Let those interested in the exposure of what is a really typical Thomson-Houston transaction turn to page 8 of last week's issue and carefully examine a copy of the inventory of the property of the Winona Street Railway Company on November 1, 1892. We think that every one familiar with the details of making an inventory of manufacturing, electric lighting, electric railway companies, or other concerns in any line of business, will admit that the work of making that inventory was done by *experts* in that particular line of work. Nothing possessing any value whatever appears to have been omitted, and things of even little value, as

Three one-gallon jugs, 45 cents;
Hammer chisel, 25 cents;
Three old shovels, 75 cents;
Office wall lamp, 75 cents;
Two screwdrivers, 50 cents;
Coal scuttle, 50 cents;

and other similar small items, were not allowed to escape the conscientious attention of the person or persons charged with the duty of making a list of all the tangible property of the company at that date. But particularly note that the sum total of all the tangible property is $83,902.22. Fix that fact in your mind, and remember that the original horse railway, capitalized for $25,000, had been reorganized and financed by the Northwest Thomson-Houston Company, an offshoot, a dependent, and, practically, only the selling agent of the Thomson-Houston Electric Company of Boston, both of these latter named companies guided by the same hand, their policy dictated by the same mind, and that hand and that mind being those of the notorious C. A. Coffin, now, and for some three years past, the president of the General Electric Company. It had then been electrically equipped, capitalized at $200,000, and the securities transferred. After this trade all the tangible property possible to be rated together as an asset against the $200,000 capitalization amounted to $83,902.22 according to the statement of the company's own agent, thus leaving a deficiency of $116,097.78 between the inventory value of the tangible property at that date and the capital liabilities. This inventory was taken by the agents of the Northwest General Electric Company, the successor of the Northwest Thomson-Houston Company, which had taken control of all the property owned by the Northwest Thomson-Houston Company, including the Winona City Railway, and which was now about to engage in a scheme for further increasing the capital liabilities of this latter company, and for selling the stocks and bonds so issued to the public. There can be no doubt, therefore, that the inventory value was as large as it was safe to make it.

The above noted deficiency of $116,097.78 between the capital liabilities and the official inventory value of the tangible property does not represent the *actual total deficiency*, for, as a matter of fact, the road had never paid its operating expenses, was also unable to pay the interest on the $100,000 of bonds already issued, interest on notes, or to earn money enough to provide a fund for the necessary renewals and repairs to its bad rolling stock and equipment, or, in other words, to provide for any depreciation whatever, to say nothing of its inability to earn any dividends on its stock. Under these circumstances the deficit and the impairment of the capital stock were increasing constantly, and the company was only kept afloat by money raised on its own notes, negotiated at usurious rates of interest by the Northwest Thomson-Houston Company, and later by the Northwest General Electric Company.

It must be further borne in mind that the inventory values given were made at a time when the property of the company was about to pass into the hands of a new corporation, and every experienced person knows that at such a time the inventory values are not likely to be made too low. That the inventory values in this case were not not too low, but were in fact much too high, can be demonstrated by an examination of a few of the larger items. In the inventory the value of four miles of single track is given at $40,000, or $10,000 per mile. This is much too high a figure for track such as that at Winona, laid under the conditions met with in that locality. The roads in that section are dirt, and the soil was of a free loamy or sandy nature, and no paving had to be done. The cost of material and labor was therefore small. The maximum cost of this track with pole lines and overhead equipment should not have exceeded $8,000 per mile, and could easily have been built for $7,000 per mile. Taken at a fair maximum the track and its equipment of overhead construction would be therefore $32,000. The generator used in the plant was of the old Thomson-Houston bipolar motor type known as D 62, and its rated capacity was 62 K. W. The list price of this machine at that time was $5,000, but there was the usual customer's discount of 40 per cent. off from list price. The ordinary selling price of such a generator, therefore, was $3,000 for a new machine; but such machines cost the Northwest General Electric Company from $1,800 to $1,900, and where sharp competition existed they were sold at or very close to these figures. A fair price for a new machine at that time was $2,200 or $2,300, and certainly this old machine was not worth any more. Closed cars then sold at from $800 to $900 each, the trucks costing about $250. New 15 H. P. motor equipments were then selling for $1,500 per car, making the total cost of a new closed car electrically equipped and ready to run $2,550 to $2,650. Open cars cost about $700, the cost of trucks, etc., being the same as on closed cars. The cost of a new open car was therefore about $2,450.

Comparing the inventory value with the most liberal valuation which should have been made, and one far above the prices which the material would have brought in the market, we have the following result, taking into consideration only four of the items mentioned in the inventory:

	Inventory value.	Actual value (if new).	Over-valuation.
4 miles track	$40,000	$32,000	$8,000
80 H. P. generator	3,500	2,500	1,000
5 closed cars	15,000	13,000	2,000
2 open cars	5,000	4,900	100
Over valuation on four items			$11,100

The same scaling down could be fairly, and justly should have been, applied throughout most of the inventory, and as a matter of fact the tangible property of the Winona City Railway Company on Nov. 1, 1892, was much nearer $50,000 than $88,902. Its actual cost to the Northwest Thomson-Houston Company when new was not over $45,000 or $50,000, and as a matter of fact an experienced agent of the Northwest General Electric, who examined the plant just before the deal resulting in its absorption by the Winona General Electric Company, reported it to be worth not over $45,000 to $50,000.

It may be argued, however, that the inventory of the actual tangible property of the company was not a correct index to the value of all of its assets because the franchises were not included in the inventory. In reply to such an argument we ask what was the value of the franchise of a corporation which was unable to earn enough to meet its operating expenses and was steadily falling in arrears on interest due on its bonds and floating debt, and with not a shadow of a prospect of such improvement in its condition as would even enable it to meet its fixed charges and operating expenses without considering interest on stock issued or reserve fund for depreciation ?

Thus it is seen that the Winona City Railway Company, after being electrically equipped and run for over one year by the Thomson-Houston people, was bankrupt when the proposition to merge it into the Winona General Electric Company was first broached. It was wildly over-capitalized, and was ripe for a receivership. The only possible excuse for a further bond issue or a financial deal of any kind was that with the money so raised improvements could be made rendering it a paying property. No such hope existed. It is clear that the company lacked all the elements for possible success.

That the gentlemen engineering this scheme to float worthless bonds could not be excused for ignorance on this point is made clear enough to any man of intelligence when the company's own records are analyzed.

The total income was $20,602.90. It was well understood even at that time that the operating expenses of a road averaged about 75 per cent. of the gross receipts, leaving 25 per cent. for depreciation, interest and dividends. Hence, by taking one-fourth of the gross receipts of this road we would have only $5,000, which would be insufficient to pay even the interest on the bonds.

The *promoters* had *absolute knowledge* of the situation in 1892.

Just how hopeless the case of this property was is readily seen with slight calculation showing what the road *needed to earn.*

The yearly fixed charges were:

Interest on bonds	$6,000.00
Interest on notes	1,200.00
Allowance for depreciation should have been 6 per cent. on $100,000	6,000.00
Dividends on $100,000 stock at 6 per cent	6,000.00
	$19,200.00
Which is 25 per cent. of what the road to be a sound property needed to earn per annum, or	$76,800.00
Actual earnings were	$20,602.90
Or less than one-third of what they must have been to justify the capitalization of even $200,000.	
Deduct from the $19,200, as above, the $6,000 item for stock dividends, which it may be argued did not need to be paid, and we have	$13,200.00
Which is 25 per cent. of what the road needed to earn in order to exist at all, or	$52,800.00
About two and one-half times as much as the road did earn after it had been electrically equipped.	

We trust we have made the case of the $200,000 capitalization of the Winona City Railway and the quadrupled capitalization of the Winona General Electric Company clear enough. It would have been unworthy so much space were it not for the fact that it is typical of the plan of financing which has debased and bedeviled almost the entire electric railway business of the country, resulting in the bankruptcy of scores of roads, the loss of millions of invested money, and the killing of confidence in electrical enterprises of all kinds.

The plan must be abandoned; those responsible for it must be driven out of the business before confidence can be restored; and with this end in view ELECTRICITY will continue to print the records of a score or more similar transactions, both in the West and in the East, making the indictment of the guilty parties so strong that they cannot escape the penalty of their wrongdoings.

Little wonder that the Winona General Electric Company, unable to earn interest on notes, confessed bankruptcy in less than two years after the great plan for raising the capitalization to $900,000 went into effect, or on Feb. 19, 1895, when Mr. Seward D. Livermore, of St. Paul, was appointed receiver.

HOW THE MONEY WAS RAISED.

When the Coffinesque plan of financing had been in operation only a short time, Mr. Coffin conceived the idea of organizing a company especially to handle the securities which his company was taking for apparatus. Accordingly the United Electric Securities Company was organized on Tuesday, May 20, 1890, under the laws of the State of Maine. At the time of organization, James F. Meech was the temporary president and Alfred A. Glazier the treasurer.

The capital of the company was fixed at $1,000,000, and the purpose of the company as outlined in the charter was to do a general banking and brokerage business in stocks, bonds and other securities and obligations.

Another clause in the charter allows the company to issue its own notes, bonds or obligations, to any amount authorized by the board of directors, under authority from the stockholders.

Of the $1,000,000 capital, the sum of $700 was paid in in cash.

At the outset this company was composed exclusively of the active managers and officers of the Thomson-Houston Electric Company. Mr. Coffin himself was the real head of the enterprise.

The plan was for the Thomson-Houston Company to exchange apparatus for bonds, taking the latter at 50 to 60, selling them to the Securities Company at 70 to 85. Then they were grouped together as underlying securities against which the United Electric Securities Company issued its own collateral trust bonds, 15 to 30 years, bearing 5 per cent. interest, redeemable at 103, as the underlying securities were sold to the public.

Without the conception of some such scheme as this the Thomson-Houston Company would have gone into bankruptcy in 1890 with a treasury full of unsalable paper. This Securities Company is therefore worthy of attention as the bridge which carried Mr. Coffin over to his grander opportunities when the General Electric Company was formed.

A little study of the plan outlined above shows the peculiar ideas of business rectitude held by the Thomson-Houston management After their own company had made what was supposed to be a fair profit on apparatus they took the proceeds of the sales, went into the market with them as individuals (though under the name of an incorporated company) to make a further profit of 30 per cent., a profit which, if legitimate or actual, belonged to the Thomson-Houston stockholders and to them only.

Mr. C. A. Coffin and Mr. H. A. Pevear, at that time officers of the Thomson-Houston Electric Company, the former now president of the General Electric Company, were and are now directors of the United Electric Securities Company.

With the profits supposed to be in sight, with almost no investment in this Securities Company, is it any wonder that the managers of the Thomson-Houston Company soon acquired the habit of actually *preferring* bonds to cash when selling apparatus, and that when a local company was forming and had several thousand dollars subscribed, they were told to keep their money—"we don't need money; we will advance money for the construction work, sell you all the apparatus you want, and take all the bonds; only make the bond issue *large enough*, and give us the bonds at 60".

The scheme was a deceptive one to local capitalists. Its workings in actual operation are becoming only too evident after five years. How will it appear as the years roll on? How will it appear when the day of reckoning comes, when the railways and lighting plants with ruined credit need new equipment, and when the bonds finally become due? How long will the evil effects of this system of raising money on worthless bonds remain to blight the entire electrical industry of this country?

The $100,000 of bonds of the Winona City Railway Company formed a part of the underlying bonds of the 5th series of $1,000,000 of collateral trust bonds issued and offered for sale by the aforesaid United Electric Securities Company July 6, 1892, as shown by the accompanying facsimile copy of page 12 of a pamphlet issued by the United Electric Securities Company, bearing date August 1, 1894.

12 UNITED ELECTRIC SECURITIES CO.

$1,000,000 COLLATERAL TRUST BONDS.
FIFTH SERIES
Issued July 6, 1892.
Statement of Sales of Underlying Bonds.

BOSTON, MASS., August 1, 1894.

Underlying Bonds.		Sold to Date.
Charleston T. H. E. Co.	$30,000	....
Citizens E. L. & P. Co.	21,000	....
City Elec. St. R'y Co.	100,000	....
Detroit E. L. & P. Co.	100,000	....
Goldsboro E. L. & P. Co.	15,000	....
Knox. S'r E. L. & P. Co.	20,000	$20,000
Louisiana El. L't Co.	140,000	....
Manhattan El. L't Co	123,000	45,000
Memphis L't & P. Co.	200,000	....
North Shore Elec. Co.	22,000	....
Peoples E. L. & P. Co.	69,000	....
Silver Bow E. L. & P. Co.	150,000	150,000
St. Louis & Sub. R'y Co.	200,000	200,000
Winona City R'y Co.	100,000	....
	$1,290,000	$415,000
Less sales to date	415,000	
Owned by the U. E. S. Co.,	$875,000	

Average Price, 87.

To retire outstanding Fives at 103, the remaining underlying Bonds should be sold at 75.3.

Receipts from sales to date	$326,250.00
Collateral Trust Fives redeemed and cancelled $341,000, at a cost of	306,528.59
Balance	$19,721.41

THE COST OF STEAM POWER.—II.*

BY CHAS. E. EMERY, PH. D.

Section 1.—Previous articles of the writer on this subject dealt with the problem as it practically presented itself at the several times. The first article in 1883† referred particularly to results which had been obtained in a number of typical cotton mills by the use of the ordinary condensing engines in vogue at the time. A more recent article in 1893‡ discussed the question of the cost of steam power in 500 H. P. units or multiples of the same developed in different kinds of engines, including the more modern triple compound engines. The first paper was based on actual conditions, the second on assumed conditions, the best experimental results being considered, but afterward modified by judgment so as to give a final result which would approximate the conditions of ordinary average working. In a later and more general article published in 1895|| the method employed to increase experimental results to an approximately practical basis was outlined, but otherwise the inquiry was extended little or no further than before.

Sec. 2. In connection with the proposed supply of power in large units from Niagara Falls and other undertakings of a similar character, the question naturally arises: What would be the cost of steam power if also supplied in large units and generated with modern machinery of the most approved type? The question would be a simple one if it involved only the amount of coal consumed at a definite price and the labor required to handle the coal and attend to the machinery. It is very common to compare the value of two engines simply by the relative amount of coal consumed, assuming that other costs incident to the development of the same power will be the same in all cases. Even if the assumption be substantially correct it has a more important bearing on the results than appears at first sight. The cost of coal is for ordinary engines of moderate size only about one-third of the total cost of steam power, so, if the other costs remain nearly constant, moderate savings in the cost of coal will not proportionally decrease the cost of the power.

Sec. 3. In large plants operated nearly at full capacity, the best types of steam machinery can be profitably employed, the cost of superintendence will be reduced and the cost of labor required for operation materially decreased. The decrease in labor depends largely on the size of steam unit it is found practicable to employ. Triple compound engines of 10,000 to 15,000 H. P. each are used quite successfully in our large ocean steamers, but it is considered that these units are altogether too large for the problem we are considering.

Sec. 4. Any supply of power must be adapted to the nature of the demand, which for most industrial operations is variable, and it is desirable to make the steam units of such size that one or more of the same can be grouped together to carry the load at any time without either overloading or greatly underloading either of such units. In a large plant, upon which presumably many different manufactories depend for power, there should be a spare unit which can be used in case of accident and ordinarily employed in regular turn so that all the machinery can be kept in repair.

Sec. 5. It will thus be seen that the size of the units is limited by the conditions above stated. If 20,000 H. P. as a maximum were to be delivered, two units of 10,000 H. P. each would do the work, but evidently the spare engine would require also to be 10,000 H. P. and this would involve too large an amount of capital in spare machinery. At Niagara Falls four connected turbines and dynamos of 5,000 H. P. each are being erected in a preliminary plant so that only 15,000 H. P. maximum can be delivered if the principles above outlined are strictly carried out, though evidently contracts can be drawn to provide that the power may be stopped in case of accident, the same as in a private establishment, and thereby all the wheels and engines put in service at the same time, but it is probable that one unit will be practically kept in reserve and more units added as the demand warrants. With steam power there would be some advantages for a 20,000 H. P. plant in adopting a unit of 2,500 H. P., on which basis with one spare unit of this size there would be nine such units in all. There is an advantage in having all the engines alike, as the parts required for repairs are then duplicates of each other, the units can be more suitably arranged in the building and the labor better distributed. When it could be done without too much detail, it would be desirable to couple together several engines of 2,500 H. P. each, so that they would be capable also of independent operation. Another method would be to disregard absolute uniformity when so much power is to be delivered and have several duplicates of two different units, say one of 2,500 H. P. and another of 5,000 H. P., which would either require the size of the spare engine to be increased, or that the other engines be slightly overworked in case of accident. For simplicity, however, all the costs will be assumed alike with either arrangement.

Sec. 6. The average cost per H. P. when the load is variable is considerably greater than if the power be furnished continuously. Coal is wasted in building up the fires and in caring for them when not required, all supplies are increased from the necessity of starting new after every stoppage, and there is an important loss due to the interruption of the regular hours of labor. A sufficient force must be kept on hand at all times to provide for any demand and the watches of the men arranged in some practical way so as to proportion the labor to the work to be done as nearly as possible.

Sec. 7. It is desirable at the outset, however, to ascertain what steam power will cost under the most advantageous conditions as to demand, and we therefore submit a preliminary estimate based on the assumption that 20,000 H. P. can be sold for every hour in the year. The details of the estimate are discussed afterward.

Sec. 8.

TABLE I.

Showing cost of steam power on basis of generating 20,000 H. P. continuously every hour in the year.

			Per cent. of total cost.
1.	Yearly cost of coal for 20,000 net H. P. operated continuously every hour in the year, based on a consumption of 1.25 pounds of coal per indicated H. P. per hour (Sec. 10). Cost of coal assumed at one mill per pound, or $2.24 per ton. Sec. 12. Engine efficiency assumed at 92.8 per cent. (Sec. 11)	$237,250	43.4
2.	Estimated cost of labor (Sec. 13)	60,444	11.1
3.	Estimated cost of supplies and regular repairs (Sec. 14)	105,120	19.2
4.	Estimated interest, insurance, taxes and cost of renewals (Secs. 15–16)	144,000	26.3
5.	Total	$546,814	100.0
	which divided by 20,000 gives the following:		
6.	Cost of steam power per H. P. per year, on basis of 20,000 H. P. delivered every hour in the year	$27.34	
7.	Cost of steam power per H. P. per year on above basis, if 5 per cent. of the original cost of plant (Sec. 16) be charged for dividends, and $1.00 per H. P. added for general business expenses (Sec. 18), 27.34 + 3.60 + 1.00 =	31.94	
8.	Cost of steam power per H. P. per year on above basis, if 10 per cent. of the original cost of plant (Sec. 16) be charged for dividends, and $1.00 per H. P. added for general business expenses (Sec. 19), 27.34 + 7.20 + 1.00 =	35.54	

Sec. 9. This cost is, for reasons which will be discussed later, lower than it is probable any plant can be operated under commercial conditions. This price is somewhat higher than those given in the papers previously mentioned, simply because operation is supposed to be continued every hour in the year.

Sec. 10. The cost of coal above outlined is derived as follows: The best triple compound engines have developed a H. P. for a little less than 12 pounds of water per H. P. per hour, and boilers have been constructed which at actual pressure from actual temperature of feed evaporated 10 pounds of water per pound of first quality coal. Both these results are under experimental conditions, but we must assume that in a large plant like this all details will be so well attended to that fair experimental results may be obtained all the time. We therefore assume that the power will be produced regularly for $1\frac{1}{4}$ pounds of coal per indicated horse-power per hour which would be obtained with engines requiring $12\frac{1}{2}$ pounds of feed-water per H. P. if the boilers evaporated 10 pounds of water per pound of coal, or if the boilers evaporated 9.6 pounds of water per pound of coal and the engines only required 12 pounds of water per H. P. per hour.

Sec. 11. For permanent work of the kind assumed, engines of comparatively slow speed should be selected, and although some of the work might be directly connected, part of it at least would necessarily be operated by some method of transmission. The frictional losses of the engines and the more important features of transmission to the work done have been assumed at 7.69 per cent., so that the amount of coal per indicated horse-power above assumed must be increased by $\frac{1}{12}$ to give the coal per net H. P.

Sec. 12. The cost of coal per ton varies greatly in different parts of the country. The actual cost of mining bituminous coal is as low as 25 cents per ton in some locations and the coal can be delivered on the cars at a good profit at 50 cents per ton. At deep mines the cost of mining is greater, but in all cases the principal cost of coal is the transportation, which has been reduced from time to time by increasing the size of the coal cars and the weight of the train and by reducing the grade in the direction of traffic, until it is credibly stated that coal can be hauled on the main trunk lines, at a profit, for one half cent per ton per mile, thus adding only $0.50 per ton for each 100 miles of haul. The lateral roads with undulating grades cannot haul coal at as low a rate as this. There is, moreover, to be added the general selling expenses, so it has been assumed that along the lakes, although comparatively near coal mines, the best quality of coal will cost a little over $2 per ton if purchased in large quantities, though this price must be increased on the seaboard fully 75 cents, and for ordinary consumers of course much more. The price upon which comparison has been made is one mill per pound or $2.24 per ton, to include the cost of delivery directly in front of the boilers. The cost in line 1, Sec. 8, is derived simply by multiplying the net power, 20,000, by $1\frac{1}{4}$, the coal per indicated horse-power, adding $\frac{1}{12}$ to allow for friction, and multiplying the result by 8,760, the number of hours in the year, and $0.001, the price per pound. The next item, that of labor, is made up as follows:

Sec. 13. Without attempting to arrange watches it is assumed that on the average there would be required in such a station at all times—

---

* A paper presented at the Twelfth General Meeting of the American Institute of Electrical Engineers, Niagara Falls, N. Y., June 26th, 1895.

† Trans. Am. Soc. C. E., Vol. XII., p. 425, Nov., 1883.

‡ Trans. Am. Inst. E. E., Vol. X., p. 119, March, 1893.

|| "The Engineering Magazine," Vol. VII., p. 796, Feb., 1895.

One attendant for each 2,500 H. P. engine, or 8 men in all, at 25 cents per hour	$2.00
14 firemen and 3 additional men at the same pay, to care for pumps, etc., and to keep the premises clean; total, 17 men at 20 cents per hour	$3.40
Total cost of labor per hour	$5.40

There would also be required a chief engineer, 3 assistant engineers and some clerical help, which under the head of superintendence would cost, say $13,140 per year, or $1.50 per hour, making a total of $6.90 per hour. The total cost for labor and superintendence for one year of 365 days, or 8,760 hours, at $6.90, is $60,444 as given in line 2 of Sec. 8.

Sec. 14. The cost of supplies and repairs in connection with the boilers and large condensing engines in the cotton mills of Fall River proved upon investigation several years ago to be approximately $\frac{8}{10}$ of a mill per H. P. per hour. With the hope that this cost can be reduced in an immense plant of this kind the quantity in line 3 has been extended on the basis that the cost will be only 0.6 mill.

20,000 H. P. × 8760 hours × $0.0006 = $105,120, as written in line 3 of Sec. 8.

Sec. 15. The above estimates only provide for regular repairs. Independent of this a certain percentage of the first cost should be put at interest every year to provide for renewals of the machinery and provision made also for paying taxes and insurance. Calling these three 5 per cent. of the cost, and considering that a company which can build so large a plant can possibly borrow money at 5 per cent., 10 per cent. of the total cost will be required for these several items.

Sec. 16. The total cost of such a plant cannot be determined accurately in advance. The present prices for steam machinery are very low, and it might be possible to buy engines of the best type with necessary boilers, ready for erection, for $30 per H. P. To this price, however, must be added the cost of the land upon which the plant is to be erected, the cost of foundations, of erection of the buildings, of the chimney, the pipe connections, the general means of transmission and the multitude of minor details required for fitting up such a place ready for use. The probable cost has been fixed at $64 per H.P. and as at least ⅛ surplus power will be put in the station there will be required a steam plant of 22,500 H. P., which at $64 will cost complete $1,440,000, 10 per cent. of which as required above is written in line 4, Sec. 8.

Sec. 17. Referring to line 6, Sec. 8, we find that the "cost of steam power per H P. per year on the basis of 20,000 H. P. delivered every hour in the year" is $27.34. The price at which this power can be sold to consumers will depend upon the way the company furnishing the power is organized. The interest on the cost is already provided for in line 4, so that the net cost given, viz. $27.34, would be that chargeable to power if the same company that built the works used the power, or if an association of individuals should build the plant and simply charge themselves with its cost.

Sec. 18. If, however, a private company with ample means should build the plant on a cash basis and wish to sell power and realize a return of five per cent. on first cost, independent of interest on the money invested, the modified cost would be $27.34 plus 5 per cent. of $72 (Sec. 16), viz. $3.60, to which should be added, say, $1 per H. P. for general business expenses, making the total charge $31.94, shown in line 7, Sec. 8, the same method being used in reference to similar lines in Tables II and III.

Sec. 19. If, however, the promoters desired 10 per cent. profit on original cost or a proportionally less percentage on stocks and bonds issued in excess of first cost, the modified cost per H. P. per year would be $27.34 plus 10 per cent. of $72 (Sec. 16), viz., $7.20, to which adding $1 per H.P. as before for general expenses gives as the total charge under these conditions $35.54, shown in line 8, Sec. 8, the method applying to Tables II and III as above explained.

Sec. 20. We are now prepared to ascertain the variations in result which would be produced if the power were considered variable. For this purpose let us assume there will be sold:

	Daily H. P. Hours.
1. 20,000 H. P., 10 hours per day	200,000
2. 12,000 H. P., 10 hours per day	120,000
3. 5,000 H. P., 4 hours per day	20,000
4. Total daily H. P. hours	364,000

which would probably be required on, say, 309 working days in the year.

5. Total H. P. hours, 309 days	105,060,000
Then if 5,000 H. P. were required for the remaining 56 holidays in the year:	
6. Total H. P. hours, 56 days of 24 hours, 5,000 H. P.	6,720,000
7. Total H. P. hours per year	111,780,000
Average H. P. per hour during the year:	
8. Previous result ÷ 8,760 =	12,760 H. P.

The average H. P. is therefore 63.80 per cent. of the maximum. This percentage is frequently termed the "power factor," and is rather higher than has been found in practical cases heretofore. An estimate of the cost on this basis will be given in advance as before and explained afterward.

Sec. 21.

TABLE II.

Showing the cost of steam power on basis of generating 20,000 H. P. maximum and an average of 12,760 H. P. for every day in the year.

			Per cent. of total cost.
1.	Yearly cost of coal (Sec. 22)	$157,644	37.3
2.	Estimated cost of labor (Sec. 23)	47,652	11.3
3.	Estimated cost of supplies and regular repairs (Sec. 25)	73,584	17.4
4.	Estimated interest, insurance, taxes and cost of renewals (Sec. 26)	144.000	34.0
5.	Total	$422,880	100.0
	Which divided by 12,760, the average H. P. (Sec. 20), gives the following:		
6.	Cost of steam power per H. P. per year on basis of delivering 20,000 H.P. maximum and an average of 12,760 H. P. for every day in the year	$33.14	
7.	Cost of steam power per H. P. per year on above basis if 5 per cent. of the original cost of plant be charged for dividends and $1 per H. P. added for general expenses (Sec. 18), 33.14 + 3.60 + 1.00 = ...	37.74	
8.	Cost of steam power per H. P. per year on above basis if 10 per cent. of the original cost of plant be charged for dividends and $1 per H. P. added for general expenses (Sec. 19), 33.14 + 7.20 + 1.00 =	41.34	

Sec. 22. The cost of coal is made up as follows: By reference to Sec. 20 it will be seen that 15,000 H. P. of boilers out of 20,000 must be shut down daily for periods varying with the demand, and it is considered that it will require an amount of coal equal at least to the average consumption for one hour during regular operation to maintain banked fires, overcome radiation, and bring the fires to average working condition when they are again put in operation. The total daily H. P. hours in line 4, Sec. 20, is therefore increased 15,000 and mutiplied by 309; the horsepower hours for the 56 holidays, line 6, are then added to the same, the sum multiplied by 1.25 pounds of coal per H. P and by one mill per pound and one-twelfth added to the whole for friction, which gives the result written in line 1, Sec. 21.

Sec. 23. The labor cannot be distributed accurately until the variations of loading are developed practically. On any definite basis, such as is assumed in Sec. 20, the watches could be arranged so that there would be little loss of time, but in practice there would be a variation of load at the same hour on different days. For instance, with the electric lighting part of the load, the demand would vary with the weather; with the cable or electric railroad portion of the load the demand would be greater on particular days and seasons, and vary also somewhat with the weather, so to be provided for unexpected demands there must be a surplus of labor. Such surplus will be assumed at 20 per cent. for the 14 hours of reduced power per working day, shown in Sec. 20, lines 2 and 3, equivalent to labor for 28,000 H. P. hours per day, or 8,652,000 H. P. hours for 309 days. Adding only 10 per cent. for 56 holidays gives 6,720,000 × 1.1 = 7,392,000 H. P. hours. Adding both to the total H. P. hours (Sec. 20), viz., 111,780.000, gives a total for the year of 127,824,000 H. P. hours, which at $0.00027 per H. P., easily derived from Sec. 13, gives:

Cost of labor per year	$34,512
Cost of superintendence per year, from Sec. 13	13,140
Total for labor and superintendence per year as written in line 2, Table II, Sec. 21	$47,652

Sec. 24. The cost of labor and superintendence above is 100 × $47,652 ÷ 60,444 = 78.83 per cent. of that required for full operation throughout the year, shown in Sec. 8, although the average power developed is only 63.80 per cent. (Sec. 20).

Sec. 25. The cost of supplies and regular repairs, line 3, will be somewhat greater proportionally than for continuous operation, and is estimated to be 70 per cent. of the similar costs given in Sec. 8, $105,120 × 0.70 = $73,584, which is written in line 3, Sec. 21.

Sec. 26. Evidently the interest, insurance and taxes given in line 4, Sec. 8, are not modified, and the percentage allowed for renewals is so small as not to materially affect the result, so the amount given in line 4, Sec. 8, is repeated in same line of Table II.

Sec. 27. The presentation in Table II will give a fair idea of the prices it would be necessary to secure on installing a large steam plant to furnish power in various quantities to consumers on the premises, or to apparatus for transmitting power to the same, the costs of which transmission are not included. The costs at which the power can be sold under certain specific conditions, as stated in lines 7 and 8, Sec. 1, are the only features that directly interest consumers of power.

Sec. 28. A large proportion of the power in manufacturing establishments is used only 10 hours per day, so this investigation would not be complete if it did not include a presentation of the cost of steam power generated with large units for 10 hours per day. Such an estimate is made in Table III, the explanation of the items being given afterward as heretofore.

Sec. 29.

TABLE III.

Showing the cost of steam power on the basis of generating 20,000 H. P. continuously for 10 hours per day for 309 days in the year.

			Per cent. of total cost.
1.	Yearly cost of coal (Sec. 30)	$92,0[illegible]6	[illegible]
2.	Estimated cost of labor (Sec. 14)	27,198	9.1
3.	Estimated cost of supplies and regular repairs (Sec. 32)	38,080	12.3
4.	Estimated interest, insurance, taxes and cost of renewal (Sec. 33)	144.000	48.0
5.	Total	$300,334	100.0
	which divided by 20,000 gives the following:		
6.	Cost of steam power per h. p. per year on the basis of delivering 20,000 H. P. continuously for 10 hours per day for 309 days in the year	$15.17	
7.	Cost of steam power per h. p. per year on above basis if 5 per cent. of the original cost of plant be charged for dividends and $0.75 per h. p. added for general business expenses (Sec. 18), 15.17 + 3.60 = 18.77; 18.77 + 0.75 =	19.52	
8.	Cost of steam power per h. p. per year on above basis if 10 per cent. of the original cost of plant be charged for dividends, and $0.75 per h. p. added for general business expenses (Sec. 19), 15.17 + 7.20 = 22.37 + .75 =	23.12	

Sec. 30. The yearly cost of coal, line 1, above, is obtained by computing the coal for 11 hours per day, for reasons explained in Sec. 22 and making the calculations explained in the latter part of Sec. 12 for 309 × 11 = 3,399 hours in the year.

Sec. 31. The labor would be occupied 309 working days, and, say, one-half the holidays (Sec. 20). The cost of labor for 337 days of 10 hours or 3,370 hours, at $5.40 per hour (Sec. 13) = $18 198. Two assistant engineers could be dispensed with, compared with Sec. 13, thus reducing the cost of superintendence to, say, $9,000 per year. The sum of these two quantities is written in line 2 of Table III.

Sec. 32. The cost of supplies and repairs is estimated at the rate of 0.6 mill per H. P. hour as per Sec. 14; 20,000 × 3,090 × $0.0006 = $38,080, as written in line 3, Table III.

Sec. 33. The amount written in line 4, Table III, is the same as for the two other cases. The cost of renewals should apparently be reduced, as the machinery operates less hours, but the percentage allowed for renewals is very small and should be increased for the other cases rather than reduced for this. Moreover, renewals are made more frequently on account of new discoveries or changes in business than from the actual wearing out of the apparatus.

Sec. 34. The prices given in the lines 6, 7 and 8 of Table III, Sec. 29, will best compare with those carried familiarly in the mind. The minimum cost derivable from the paper in Transactions for 1893, above referred to, is for coal at $2.24 per ton and ten hours per day, $22.31 per H. P. per year. This should be compared with $18.77 in line 7 of Table III, as the previous calculations provided for 10 per cent. interest and dividends, as is provided in lines 4 and 7 jointly in Table III, but not for general business expenses. The difference is $3.54 per H. P., corresponding to a saving of 15.87 per cent. by generating the power on the larger scale.

Sec. 35. The quantities in the previous paper above mentioned were augmented here and there so as by judgment to try and approximate the various losses incident to average practice, though insufficiently to show the results of such practice in some locations. The prices herein given are as low as it would be safe to expect with very careful management of a very large plant. The comparatively small difference in result is due to the influence of the constant cost shown in line 4 of the several tables. It forms 26.8 per cent. of the total cost for 20,000 H. P. every hour in the year (Table I, Sec. 8), 34 per cent. for variable power, 20,000 H. P. maximum, 12,760 H. P. average day and night, and rises to 48 per cent. for 20,000 H. P. during 10 hours of the ordinary working days in a year. The cost of coal is respectively 43.4 per cent. 37.3 per cent. and 30.6 per cent. of the total cost for the same three conditions. The fixed charges also increase greatly the cost of water power, as the writer has had occasion to call to the attention of parties engaged in these large hydraulic enterprises.

Sec. 36. It should be borne in mind that if water power or power derived from water be sold on a 24 hour basis, but can only be utilized during 10 hours per day, the cost of the water power direct or derived should be compared, not with the cost of steam power on a 24 hour basis in Tables I or II, but with that of steam power on a 10 hour basis in Table III.

Sec. 37. It should also be borne in mind that all these estimates provide for fixed expenses, such as interest, insurance, taxes and cost of renewal, and that in comparing the prices above given with the cost of water power, similar fixed expenses should be added to the price of such power, based on the cost to consumer of installing the water power or the mechanism through which the power is derived. For instance, manufacturers located on the canals of large water power companies necessarily build their own head and tail races and wheelpits and install the gates, screens, turbines and means of transmission for utilizing the power. This when well done in many locations costs as much as to install a steam plant, so the fixed annual charges for this item alone would be $5.00 to $7.00 per H. P., which, together with cost of labor and supplies, must be added to the cost to be paid for the water power in order to compare with the cost of steam power as presented in the tables of the writer.

Sec. 38. When power is electrically transmitted, the consumer is generally required to pay for the electric motor, the general means of transmission therefrom and some incidentals. The cost of this work, together with the portion of the building and even of the real estate occupied should be considered in the same way as has been done above, and at least 10 per cent. of such cost, together with actual costs of labor and supplies, added to the tendered price of net power delivered, in order to compare the cost of power obtained in this way with the cost of steam power shown in the various papers of the writer, which are written on the basis that a manufacturer should receive a profit on the money expended in plant as well as that expended in his business. If interest is left out in one case it should be in the other and it is already included in the tables.

Sec. 39. The last column of the several tables furnishes a ready means of eliminating either of the items of cost desired. For instance, in Table III, which is on a 10-hour basis, we find in line 4 that the "estimated interest, taxes and cost of renewal" is 48 per cent. of the total cost, which cost to the parties owning the power in such table $15.17 per year (line 6). The cost of steam power per H. P. per year from large units for 10 hours per day, without considering the above items, is therefore only 0.52 × $15.17 = $7.89, which is the cost to be compared with the price of power from an external source when the items above referred to are excluded in each case as they are in the popular discussion of the subject. The similar cost from the estimate in the Transactions of American Institute of Electrical Engineers above referred to is $22.31 (Sec. 34) less (3.31 + 7.17) = 22.31 — 10.48 = $11.83, the difference being due principally to the assumption that the power is generated on a larger scale in the first case.

ELECTRIC POWER IN FACTORIES AND MILLS*—II.

BY F. B. CROCKER, V. M. BENEDIKT AND A. F. ORMSBEE.*

The question of running machine tools by individual motors or grouping a number of machines together and driving them by one motor, does not seem to allow of a general solution. It would not be advisable, for example, to use the individual system where there are a number of small tools, each one of which requires only a small fraction of a horse-power. On the other hand, if we have a large tool that requires considerable power it would seem to be far more economical to run it by a single motor, using as little belting and shafting as possible.

Many of the manufacturers of machinery are now supplying boring mills, punching presses, drill presses and other machine tools arranged to be driven by electric motors. In most cases all that is necessary is a shelf or bracket on the tool to support the motor and a gear wheel in place of the main pulley, unless a belt connection is preferable. A press or other tool having a large fly-wheel may be driven very conveniently by cutting teeth on the edge of the wheel which gear with a pinion on the motor shaft.

ELECTRIC POWER IN THE NEW ENGLAND COTTON MILLS.

The introduction of the electric system of distribution of power in the cotton industries of New England is now fairly begun. Although there are no large mills driven entirely by this system a number of them have an electric plant and certain sections of the mill are driven by motors. An electric plant was installed four or five years ago in the works of the Silver Spring Bleaching and Dyeing Company at Providence, R. I., but it was intended chiefly for lighting. But motors were placed in the carpenter and repair shops and several other places until at present there are about 100 H. P. of motors installed in eight units. The generating plant consists of three 100 H. P. U. S. dynamos belted together from a countershaft which is driven by a Corliss engine. Two of the machines are 110-volt dynamos which are used for lighting and running most of the motors at present. The third machine which has just been installed is a 500-volt Westinghouse power generator of the same type as the lighting machines. There is only one machine at present connected to the 500-volt circuit, a 30 H. P. motor which drives a centrifugal pump supplying a storage reservoir with water for use in the bleacheries. The electric plant in this mill is not of much importance yet, but its chances for development are very bright since there are a number of machines now run by individual steam engines. These could be most advantageously replaced by electric motors as they are in some cases a great distance from the boilers, involving large losses from condensation.

A visit was made to the works of the Donnell Manufacturing Company, at Pawtucket, R. I., where a very fine electric plant has recently been installed to drive the calico printing machines. The problem of running this class of machinery by electric motors has been a very difficult one to solve, for the motor must be capable of running at a number of different speeds and running constantly at any given speed with a variable load. In this case it has been solved by the use of a modification of the Leonard system of motor regulation. The outfit for each printing machine consists of a motor and a dynamo of the same size, the field rheostat of the dynamo being placed alongside the printing machine. The speed of the motor is thus changed by varying the voltage of the particular dynamo which supplies it with currents.

The dynamo room contains eleven dynamos of the new moderate speed four-pole type, made by the General Electric Company. They are run by a Corliss engine through a system of belting and ceiling countershafting. Six of these are 20 K. W. machines and four are 25 K. W. The eleventh dynamo is a similar 20 K. W. machine used for exciting the fields of the other dynamos. The normal potential is 250 volts, and is lowered in any particular dynamo when slower speed of the motor connected to that circuit is desired. This plant has been completed but a short time, and it was not possible to obtain any accurate figures showing the power used by the motors under various conditions of speed and load. Formerly the machines were run by individual engines and much difficulty was experienced in starting them, as the pressure of the printing rolls against the cloth is so great. With electric motors this difficulty is overcome, as the motors will stand a very heavy overload for a short time, and the starting torque is very great. The great advantage of the electric system as here used is not so much in the saving of power as in the convenience to the workmen, and hence the increased production.

The saving of power, however, is quite considerable as in the old system steam was piped several hundred feet to the small individual engines, which were necessarily inefficient under the best conditions, and added to this the engines were run part of the time with partly closed throttle, still further decreasing the efficiency. With the present system the attendant at the machine may quickly vary the speed any amount by turning the rheostat near the machine.

Although this plant has been in operation only a short time, it is claimed by those in control that the production is materially increased. In a paper by Mr. S. B. Paine in *Power*, June, 1895, he states that the increase in the production amounted to more than 25 per cent. and that the quantity of "seconds" (inferior product) was also considerably reduced.

This is very important as the men in charge of printing machines are skilled workmen of the higher order and a small saving of wages for a given production is of more value than a considerable saving of power.

A visit to Baltic and Taftville was also made to see the practical working of the well-known power transmission plant between these places. At Taftville, where the Ponemah mills are located, there is not sufficient water power to drive all the machinery, so an electric plant was installed at Baltic, 4½ miles up the river, where a dam had been built giving an available head of 34 feet. The wheels are horizontal balanced turbines, two of them being rated at 800 H. P. each, while the third one is rated at 300 H. P. The wheels are belted to a long line shaft, which is in turn belted to the dynamos. The generators, of which there are two, are placed in a separate room. They are of the three-phase General Electric type and are capable of supplying 250 K. W. at 2,400 volts. They have ten poles and run at 600 R. P. M., giving a frequency of 50 cycles per second. The field is excited by a 3 K. W. bipolar dynamo belted from the generator shaft. The power is transmitted to Taftville by a well constructed pole line. The motors are located in the basement of the Ponemah mill near the engines which they replace. They are belted to pulleys which are connected to their respective shafts by friction clutches in order to enable the motors to be started without load, as they are of the synchronous type. The motors are identical with dynamos except in having an induction winding of heavy bars sunk in the pole-pieces, to cause them to be self-starting. In starting the motors, the switch in the induction circuit is closed and then the line is connected to the armature, causing it to start as an induction motor, without a very great torque, however. When the motor has nearly reached full speed the field is excited and it will speed up until it falls into step and then the induction switch is opened. This method of starting has two advantages: first, no auxiliary motor is needed; second, no device is required to tell when the motor is in synchronism with the generator.

---

* A paper presented at the twelfth General Meeting of the American Institute of Electrical Engineers, Niagara Falls, June 27, 1895.

One of these motors drives 1,200 looms requiring an expenditure of about 155 H. P. The other drives 500 looms and also the railway generators for the Norwich Electric Railway Company. The introduction of this plant has enabled the company to concentrate all its power for use in one mill, tending to decrease the cost of production, diminishing transportation charges and avoiding the use of any coal for steam power.

CONCLUSIONS.

First Cost.—Practically the only objection which can be urged against the electric system is the fact that the first cost of installation is greater than with ordinary belting and shafting, but even this is questionable since the authors know of cases in which the estimated total cost of installing the necessary belting and shafting was actually greater than the equivalent electric motor outfit. The electric system would be cheaper, for example, in the case of very long or scattered buildings or those containing many stories or rooms, in any of which cases the belting and shafting required would be very complicated and expensive. The use of belting and shafting requires a much stronger and more expensive roof or ceiling than the electric system.

Saving of Power.—It might seem that the electric system would actually consume more power than the ordinary plan since it involves two transformations of energy. In most cases, however, if the power has to be distributed to a number of machines, particularly if they are located at any distance from the engine, the loss of power is less with electric transmission. This is explained by the high efficiency of the dynamo and motor compared with the low efficiency of belt transmission as ordinarily practised, involving as it often does very imperfect alignment and lubrication of the shafting. Perhaps the greatest saving, however, of the electric system is due to the fact that the consumption of energy entirely ceases when the tool stops. This stoppage in the case of the busiest tools amounts to at least 25 per cent. of the nominal working hours throughout the year, and with large or special tools which are not used so steadily the stoppage is often as high as 50 to 75 per cent., since there are many whole days when they are not used at all.

Idleness due to strikes as well as to slack times must also be considered and would usually amount to quite a large percentage in ten years, for example. This assumes, of course, that a portion of the shop is running, which is usually the case even under such conditions. In short, with the mechanical system there is an enormous amount of shafting, idle pulleys and belting which runs for long periods of time doing little or no useful work but consuming considerable power.

Wherever electric motors can be substituted for a number of small engines scattered about, the saving in power is very great, not only because of the low efficiency of small steam engines, but also by the avoidance of condensation in long steam pipes.

Increased Output.—This is, perhaps, the most important advantage gained by the electric system since after all the cost of power is a very small item, being, according to Mr. Richmond* only about 1 per cent. of the wages paid in average machine shop practice.

This increased output is secured by greater convenience and promptness in starting and stopping as well as in regulating the speed of the machinery. The workman can, for example, temporarily increase the speed when the conditions are favorable, thereby saving considerable time.

Flexibility.—The great convenience of moving the tools and placing them in any desired position is another great advantage of the new system. The great adaptability of this system is particularly well shown in the case of a factory which was almost completely destroyed by fire, nevertheless a few uninjured tools in a remote end of the building were operated successfully by means of electric motors within two days after the fire.

Speed Regulation.—The ordinary type o motor used in factories is the plain shunt wound machine fed with constant potential current. The motor is started and varied in speed by means of a rheostat in the armature circuit. This simple arrangement answers very well in most cases, but for variable speed between wide limits a series wound motor controlled by a rheostat as in railway practice may be preferable. In other cases some special method of regulation, such as the Leonard system, or the "boost and retard" plan may be adopted.

In concluding, the authors wish to express their sincerest thanks to the various companies for the courtesy shown by them and for the kind assistance which they rendered during the tests.

Multiple Current Dynamos.

BY RANKIN KENNEDY.

This long neglected class of dynamo seems at last to have met with that favor to which its merits entitle it. No particular description or notice having hitherto been given of a dynamo of this kind built on up-to-date lines of electrical engineering, the author hopes that the following description of his own design will be of interest.

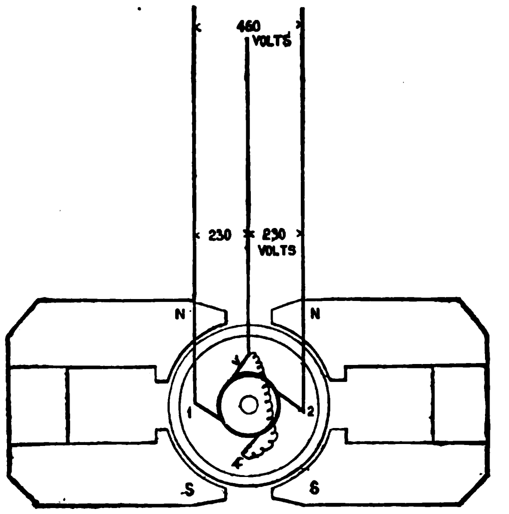
In most isolated electrical plants in mills, factories, mines, shipbuilding yards, railway stations, etc., we find arc lamps, motors, and incandescent lamps, and if the installation is of any magnitude, it very soon becomes apparent that the common constant pressure 110-volt dynamos alone are not sufficient for the work being carried out with efficiency and at reasonable cost. Then it is found desirable to run the arc lamps in series, and also to run the motors at a pressure of between 400 and 500 volts, while the lamp pressure is limited to 230 volts at the present moment, and quite recently were limited to 120 volts.

The consequence of this is that different machines are required for the different purposes, and the expenses of first cost and maintenance are thereby greatly increased.

I cannot do better than quote Mr. W. Langdon in his paper on "The Employment of Electric Light for Railway Purposes," read before the I. E. E. on March 28:

"A further advance is to be looked for in the unification of the class of generator. At the present moment it is necessary, where series arc and incandescent lighting has to be provided, to lay down independent power and independent machines for each, or to drive the arc lights from alternating or transformed alternating currents. To drive arc lights on the series-parallel system for any material distance from the generating plant would entail so large an outlay in cables as to strongly militate against its adoption for such small plants as railway companies require. It would appear that what is needed is a generator the energy derived from which may be applied alike to incandescent lighting, arc lighting, or motive power—for the latter is an application which will have to be provided for. Is this to be most economically and most successfully met by an alternator or by a direct current machine? Are we to look for help in this direction from 'rectified' currents? If a system having for its basis one common generator can be established without too great a sacrifice in efficiency, small installations, such as would be of great service to railway companies in many busy centers, could then be brought within a more economical compass than is now the case. Three units—one for the light load, another for the full load, and a third of similar capacity as spare—would probably meet the requirements of every depot, whereas at present spare units for both arc and incandescent work are necessary.

"For instance, at Birmingham (Lawley street), the plant, when all is complete, will consist of six 50-light arc lighting machines and two incandescent machines. Now, if all this could be met by three generators—one for the light load, arcs and incandescents combined, another for the full load, and a third as spare—the engine and dynamo space would be largely reduced, the labor and repairs correspondingly lessened."



These are the expressions of an engineer who has had, perhaps, more experience in working isolated plants than any other man.

For municipal plants this class of machine also has advantages, but as it generally takes about 10 years' education to reach the point at which municipal engineers open their eyes to improvements, we cannot just yet expect the adoption of this class of machine in these plants; nevertheless, it can be recommended to their notice as a means of working high pressure and continuous currents without complicated plants. The distribution system could thereby be worked at 200 or 230 volts, and the transmission feeders or outer mains at 460 volts.

The miserable performance of many of the municipal plants would be infinitely improved in the matter of constant pressure and freedom from sudden drops when current is turned on to motors and large installations, while the carrying capacity of the copper mains would be quadrupled.

Of course all this can be done by coupling two ordinary dynamos in series—quite true; but it requires no arguments to prove that if it can be done with one dynamo the improvement will be great. The orthodox fashion of coupling two dynamos in series for three-wire working seems to be deeply rooted in the minds of the engineers about central stations, but there has never been a satisfactory explanation given as to why this practice cannot be improved upon, nor any rational account of its advantages.

---

* *Engineering Magazine*, January, 1895.

The multiple current dynamo was first constructed and patented by the author in 1882, Specification No. 1,640, but it has never been fully understood until now when the progress of electric power renders such a machine a necessity; hence others have now come forward with similar plans to meet the want and claim it as a novelty.

If we take a four polar dynamo, and instead of making the poles alternating N, S, N, S, make two upper ones N, N, and the lower ones S, S, it immediately becomes a multiple current dynamo, and we can take a current at 460 volts from one pair of brushes, and another at 230 volts from the second pair, or 120 and 240 volts may be so obtained.

Referring to the Figure, the brushes 1 and 2 supply pressure at the full volts, say 460, and between the brushes 1 and 2 and the brushes 3 and 4 a pressure of 230 volts is obtained; the brushes 1 and 2 are connected to the outer mains of the three-wire system, while both 3 and 4 are connected to the third or middle wire.

The brushes 3 and 4 set up no disturbance whatever in the field, and are sparkless so long as the load on each side of the system is fairly balanced.

Similarly a five-wire system can be formed by having three pairs of poles and five sets of brushes.

The coils sweeping across the gap between the similar poles, N, N, or S, S, are not generating E. M. F., the brushes 3 and 4 do not therefore cause any trouble by their short-circuiting these coils, and there is neither any polarity nor magnetic distortion of the field caused by the current entering or leaving the brushes 3 and 4.

Such a machine built to the designs of experienced and skilled electrical engineers meets the requirements of Mr. Langdon in his ideal railway plant. It also fills the want at collieries, mines, factories, mills, etc., for a machine capable of running incandescents, arcs and motors, simultaneously, with the highest efficiency and at the lowest possible cost and maintenance.

Prize Essay on Heaters.

The German Hygienic Association, says the *Gas World*, offers a prize of £225 for a research essay on the heat given out by heaters. The programme is: "The heat given out in heating installations by heaters in their various forms and modes of use is to be ascertained. The investigations are to be described in detail in respect to the arrangement of the heaters, the nature of the heating agents, and the observations made; and they are to be illustrated by drawings. The heating values obtained are to be stated in units of heat given off per hour per unit of surface. In the case of heat given out to air, the investigations must be conducted with currents of air at speeds as different as possible. The heaters are to be described in detail as regards form and measurement, and the relation of their heating efficiency to their weight is also to be ascertained." Essays to be written in German, with a motto and sealed envelope, and sent to Prof. Konrad Hartmann, Charlottenburg, Fasanenstrasse, 18, before July 1, 1896. The essay will remain the property of the successful competitor, but he must publish it within six months, and give the prize offerers 100 copies gratuitously. The prize may be divided or withheld.

Philadelphia's largest trolley party made a round of the suburban roads in fifty cars one evening last week. Nearly every car carried musicians, and several brass bands were in the outfit.

Monocyclic Patents in Doubt.

IS THE STEINMETZ SYSTEM A COPY OF A GERMAN DEVICE?

Notes on the So-Called Monocyclic System.*

BY HANS GOERGES.

The article in No. 23 of the *Electrotechnische Zeitschrift* prompts me to make a few remarks concerning the so-called monocyclic system, on account of the references that were made in that article to the installation at the Dresden railway station.

The author of that article sees the leading thought of Steinmetz's system in: "A multiphase system of distribution, in which the energy for the lighting service is taken from two main conductors, while for the motor service these two conductors and a third auxiliary conductor is used."

This system does not only "*resemble*" the Dresden system, but it is absolutely the same. This system of distribution was offered to the firm of Siemens & Halske by the constructor of the installation, Prof. Dr. Ulbricht, in the latter part of 1892. Siemens & Halske made at once experiments in their factory which demonstrated the practicability of this system and they concluded its application for the Dresden plant.

The Dresden plant, which was described in the *Electrotechnische Zeitschrift* in 1893, commenced operations in April, 1894, with two dynamos of 300 H. P. each. This it will be noted was about the time of the first applications of the Steinmetz patents. In the meantime the installation has been increased to four dynamos of 300 H. P. each, and is operating at present about 200 arc lamps, 800 incandescent lamps and 44 motors of 180 aggregate H. P. Only that part of the system which furnishes energy for the lighting circuit is regulated for pressure.

When this installation was first considered, a proposition was also made to use multiphase dynamos and multiphase transformers for the power service and alternating current machines and alternating transformers for the lighting service, and connect these in multiple. Experiments proved that such an arrangement is entirely feasible and practicable. In consideration of the large power service, however, and the large reserve power, all dynamos and transformers were built for the multiphase current.

The plan and system of distribution of the Dresden plant were described in 1893 in No. 28 of the *Electrotechnische Zeitschrift*, or in other words, nine months prior to the application of the first Steinmetz patents. In the article referred to, it is stated that the question was raised whether it would not be advantageous to use for the lighting the ordinary alternating current and add to it a second phase for the motor service. It will be observed that we have here the very idea expressed in a general form. We also find in this article a diagram of the system. The Dresden plant was furthermore familiar to a number of technical men who visited this plant on occasion of the annual meeting of the Association of German Electrical Engineers in June, 1894.

Therefore I wish to emphasize again that the idea was practically executed in a large plant in Germany, and had been described nine months prior to the date of the first American patent application of Mr. Steinmetz. The idea is therefore of German origin and its priority belongs to Prof. Ulbricht, in Dresden. I make this remark without any intention on my part to reflect on the originality of the work of Mr. Steinmetz.

---

*Abstract from the "Electrotechnische Zeitschrift," June 27, 1895.

THE EFFICIENCY OF BOILERS.*

BY F. W. DEAN.

There is no common matter about which there are fewer accurate and scientific ideas than about boilers, their actual performance, the reasons therefor, the proper criterion by which to judge of their performance, and the economical merit of a boiler. There is also, in the minds of many who ought to know, no idea of the limitations of boiler evaporations nor of the magnitude or nature of boiler losses. Extraordinary, if not impossible, guarantees are made, and evidently only for the purpose of securing contracts and trusting to good fortune to escape a penalty. Such guarantees produce injury to other boilermakers, mislead the consumer, later causing him, when he finds out the impossibility of the guarantee, a great deal of annoyance, if not expense, and are in fact immoral.

It is not uncommon to use a particularly rich quality of coal on a boiler trial, and to use the result, which is wonderfully good, in advertising the boiler, and thus to deceive the public. Any coal-dealer, probably, will furnish a picked lot of coal for tests, and will send it sealed in a box car to the place of consumption. Nobody feels the advantage more than the writer of having a standard coal of uniform quality for boiler trials in this country, as they have hand-picked Nixon's navigation coal in England, but there could scarcely be anything more misleading than results sometimes published. A poor boiler tested with good coal may give a greater evaporation than a good boiler with poor coal.

Results may be vitiated for comparison by drying samples of coal, for moisture allowance, different lengths of time. Sometimes the sample is dried twenty-four hours, and thus is favorable to the boiler, while other samples may be dried six or eight hours. In order to do away with this difficulty I recommend that a well-selected sample, weighing six or eight pounds, be dried six hours in a clean pan placed in the boiler flue. This sample should be weighed with a scale which is accurate to quarter-ounces.

Considerations of this kind lead to the inquiry How can a boiler trial be reported so as to show the true value of the boiler as a generator of the possible heat in the fuel and as an absorber of the heat generated, independent of the quality of the fuel? The reply to this question is that its "efficiency" must be determined and reported. The definition of "efficiency" is as follows: "The efficiency of a boiler is the ratio between the total heat which any given coal can generate by complete combustion, and that part of it which is absorbed by the water and steam heated and generated."

The next question is: How can dealers be made to base their guarantees upon efficiency, and how can purchasers be made to understand the meaning of efficiency? The answer is: Through the efforts of this Society.

This naturally leads to a discussion of the report by a committee of and to this Society, recommending a standard method of making and reporting boiler trials, as printed in Volume VI of the "Transactions."†

That report is emphatic in expressing the desirability of a standard method, and particularly of the importance of expressing the value of the boiler. On page 259 the report says: "The scheme must also be so complete that, if carefully and exactly followed, the precise value of the boiler may be ascertained with certainty." Yet after this the word "efficiency" is scarcely mentioned, much less recommended, as a measure of value, thus wholly missing the point. Wherever used, it is in the most general sense. In one discussion it appears with its proper signification.

---

* Abstract of "A Criticism of the Society's Standard Code of Reporting Boiler Trials," presented at the Detroit meeting of the American Society of Mechanical Engineers. From "The Engineering Record."

† "Report of a Committee on a Standard Method of Steam Boiler Trials." "Transactions," Volume VI, p. 256, No. 168.

The report recommends, on pages 262-263, that its standards of power and economy be respectively the "commercial horse-power" and "unit of evaporation," both of which are explained. It then says, page 263, that the relative economy of boilers is expressed by the number of units of evaporation obtained by a pound of combustible. Nothing could be farther from the truth. In fact this conveys only the roughest idea of the relative economy of boilers, and takes no account of the fact that combustible, as well as coal, varies in heat value per pound. In a recent case that came under the writer's notice a pound of combustible contained 14,177 units of heat, and another 15,398. The latter is 8.6 per cent. greater than the former, and therefore ought to evaporate at least 8.6 per cent. more water from and at 212 degrees. If the evaporations per pound of combustible in the two boilers using these coals had been equal, according to our Society's code they would have been equally good boilers. It is evident, however, that they would have been far from equally good. In one case the evaporation was 11.85 pounds on this basis, while with the better coal in the same boiler it would have been 11.85 × 1.086 = 12.87, thus changing it from a fairly good to a remarkably good boiler. The boiler using the better coal gave a better result than it is in general entitled to, and has apparently misled both its designer and builder, as well as the public, while if its merits had been judged by its efficiency it would have taken its proper place as a generator.

Next to be considered is, How can the efficiency be determined? This is determined by knowing the number of units of heat that a pound of coal and a pound of combustible will give out when burning under perfect conditions, and the number of heat units that the water evaporated has received. In doing this the heat that goes up chimney should not be deducted from the possible heat of the coal, as is sometimes done, for different boilers allow different amounts to escape. It should be the function of a boiler to reduce this heat as much as is consistent with the temperature of the steam.

There are two methods of obtaining the heat value of the coal, one by burning a representative sample in some kind of oxygen calorimeter, and the other is to analyze the coal and equate the elements with their heat values. The oxygen calorimeter is generally preferred, but as it is considered to be the better the nearer its result comes to that computed from the analysis, the writer prefers to use the analysis and thus avoid the imperfections of the calorimeter. As most engineers will wish to have their coal analyzed, it is best to use this for heat value and avoid the expense of a calorimeter determination. This is a point, however, that the Society must determine.

Our standard method recommends coal analysis, but is silent as to what use is to be made of it. Neither does it mention the oxygen calorimeter nor does it speak of computing the heat value of the coal from the analysis.

Having now called attention to the defects of the standard method of making trials and judging of the value of boilers, I wish to add that wherever there is an economizer a boiler trial should in general include a determination of the effect of the economizer. These devices are now very common, and in many cases have sufficient heat to work upon to convert a wasteful plant into an economical one.

DISCUSSION.

The discussion of Mr. F. W. Dean's paper on "The Efficiency of Boilers" was opened by Mr. George H. Barrus, who expressed himself as being in sympathy with Dr. Dean's recommendations, and he thought the committee should make special study to recommend a standard form of calorimeter tests of coal. He strongly believed in a calorimeter rather than a chemical analysis of coal for the reason that the work would have to be intrusted to a chemist, while the engineer should be responsible for the test from first to last, and he cannot, as a rule, satisfy himself regarding the chemical determinations so as to be able to vouch for them himself. On the other hand he thought the calorimeter test quite as simple as the boiler test itself.

Prof. J. E. Denton sent in a written discussion, which was read by Secretary Hutton, in which a method was described for comparing the heat values of different coals as obtained by an oxygen calorimeter with the heat obtained by burning the coal under a boiler. Prof. Denton believed that the method employed by Mr. Dean, to determine the efficiency based upon combustion, would be correct only when the percentage of ash by the analysis was the same as the percentage of ash under the boiler, which in general was not the case. He thought it well to consider the evaporation per pound of coal, as the efficiency of the grate then entered into the result.

Prof. Jacobus began the oral discussion by taking exception to Mr. Dean's proposition to base the efficiency of a boiler on the pound of combustible, and he thought that if the boiler performance was based upon efficiency a specific method should be proposed in regard to what should be done to determine the latent heat of the moisture in the products of combustion due to the hydrogen in the coal. He thought it better to determine the heating value of coal from a calorimeter than by chemical analysis, because of the uncertainty of the composition of the volatile matter, and did not believe in changing the commercial horse power from 34½ to 35 pounds on the ground that there were many tests that were figured upon that basis and constantly referred to.

Mr. William H. Bryan, of St. Louis, objected to drying a sample of coal under a high temperature for so long a period as six hours, as he thought it would drive off some of the characteristic moisture in the coal. He thought it best to have chemists make a coal analysis, but instead of changing 34½ pounds to 35, thought it ought to be lowered so as to correspond with the lower steam consumptions of the present day.

Prof. R. C. Carpenter thought a chemical analysis of little use for bituminous coals, as you do not know the composition of the volatile matter, and it is impossible for this reason to obtain a reliable result. He believed in changing the standard as regards efficiency of boilers, but not as to commercial horse power.

Mr. George I. Rockwood thought that the Society was getting away from what was wanted, inasmuch as he thought it more to the purpose of boiler manufacturers than users to have boilers tested in this refined manner. He thought the evaporation per pound of coal, which was the vital point to the user, of more importance than a refined efficiency test.

Mr. R. W. Hunt was inclined to side with Mr. Rockwood and thought the term combustible decidedly elastic, inasmuch as a considerable amount of unconsumed coal might go through the grate and thus raise the efficiency of the boiler. He thought that the committee should look into the question of starting and stopping tests, and he expressed his preference for the running start instead of hauling the fires. He believed the results of a test should be worded with a view of making steam with the least money instead of the highest efficiency.

Mr. J. C. Platt thought the duration of a test should be considered.

Col. E. D. Meier then read a communication from Prof. Potter of St. Louis, who objected to drying a sample of coal in a temperature higher than 220 degrees on the ground that the coal would lose all of its accidental and part of its characteristic moisture, and if the coal was finely divided he thought that it would also lose quite a little of its volatile matter. He thought that some coal of good quality should be adopted as a standard for each section of the country. Col. Meier said he also objected to the use of the term "combustible," and that engineers in charge of street railway and lighting stations thought it of no value. He said that he had known of parties deliberately poking coal through the grates when the result of the tests were to be based on pounds of combustible.

Mr. D. L. Barnes referred to some recent experiments of a railroad company which had shown that there was no certain relation between the results obtained by burning coal in boilers and by chemical and calorimeter tests.

Mr. G. C. Henning thought that the question of testing boilers with liquid and gaseous fuels should also be considered.

After some remarks by Mr. William Kent on the work of the earlier committee, it was voted, on motion by Mr. Henning, that the council appoint a committee of nine members to reconsider the report of the standard methods proposed in 1885 for conducting boiler trials and to report their results to the Society.

ELECTRIC TRACTION BY ACCUMULATORS.*

BY J. SARCIA.

I confine myself, in my communication on electric traction by accumulators, to the description to you of the industrial application which has been made by the Tramway of Paris and the Department of the Seine on the lines of Saint Denis to Paris and of Saint Denis to Neuilly.

Electric traction has been substituted in a complete manner for the old animal traction since June 1, 1892.

The three lines have their termini in the vicinity of the depot of Saint Denis. They bear the names of: 1, Saint Denis—Madeline; 2, Saint Denis—Opera; 3, Saint Denis—Neuilly.

The first two are of a length of about 6 miles each, of which half is in the interior of Paris. The third is nearly 3.6 miles long; it is entirely situated without the enclosure of Paris.

The number of car-miles actually travelled in service by the electric cars exceeds 1,200,000.

Since the month of June, 1893, the average monthly travel by the electric cars is 48,000 car-miles for the three lines. It is not therefore a mere experiment, but an actual industrial application. . . . . .

The two principal lines include grades up to 3.8 per cent. In certain places the radius of curvature is less than 20 meters.

Each axle is actuated by a motor by means of two trains of double helical gearing. The ratio of angular velocities of motor and axle is 12 to 1.

The accumulators are of the Laurent Cely system, made by the "Societe Anonyme pour le Travail Electrique des Meteaux."

The battery is placed under the seats of the car. It is composed of 108 elements of 11 plates, contained in jars of hard rubber.

The dimensions of the plates are as follows: Height, 7.9 inches; width, 7.9 inches; thickness, negative plates, 0.24 inches; thickness, positive plates, 0.315 inches.

The weight of plates in one element is about 39.6 lbs.

These 108 elements are distributed in twelve wooden boxes, six for each side of the car. The nine elements of one box are grouped in tension, and the poles of the little batteries thus formed end each in a strip of copper fastened to the side boards of the box. . . . . .

The battery room has twenty-four spaces for batteries. Each of them is connected to a switchboard by a special circuit containing an ammeter and an indicator of the direction of the current, and on each pole a circuit-breaker and an interrupter.

The handling of the batteries between the charging tables and the cars is done by means of trucks rolling on "Decanville" tracks, which run parallel to the tables and car tracks. . . .

The dynamo generator gives at a speed of 600 revolutions a current of 230 amperes, with an E. M. F. of 260 volts. They are grouped in quantity after the manner of the batteries in charging.

Since the beginning of the year 1895 the charging dynamos have been supplemented by two dynamos connected in series with the first and acting in the capacity of volt-raiser. The charging is done at two potentials—at the beginning at the potential of 250 volts, and after two hours of charging at about 280 volts.

The charging of the batteries is prolonged until they have absorbed a number of ampere hours equal to those delivered in service, with an increase corresponding to the current efficiency of accumulators, which is 85 per cent. The number of ampere-hours discharge for each route is determined experimentally by means of a recording ammeter. The duration of charge is five hours for a battery which has furnished all its capacity, which is 230 ampere hours, that is, 52 horse-power hours. The energy efficiency of batteries reaches 70 per cent.

---

*From "The Bulletin de la Societe Internationale des Electriciens" for April.

Two engines are arranged for a charge lasting twenty-three hours per day, the third engine is only in use six hours. The batteries furnish in service an E. M. F. above 200 volts; the discharge, which attains 100 amperes, is more than 2 amperes per pound of plate.

It reaches 120 amperes on the steep grade, or in case of towing a second car under unfavorable circumstances. The average discharge for the entire line is about 35 amperes.

One battery will furnish without recharge a trip of about 36 miles on the common Borca rails, or 70 miles on the Vignole rails.

The daily service of the Madeline line includes 104 trips, that is, 52 round trips. Seven self-contained cars travel on the line, some 8 and the others 9 trips, or 88.8 miles and 97.5 miles, whereas the horse cars traveled at the most not over 60 miles.

The conditions of operation are the same on the Opera line, except on the part of that line situated outside of Paris, where the motor cars tow an ordinary car with 50 sittings, so that the number of passengers to a train is 100.

Three cars are in service on the Neuilly line. The service of each car is assured by two batteries, making without recharge two trips out and back on the Opera and Madeline lines. In the last case the battery furnishes a run of about 30 miles. The duration of a trip, including stopping and standing at terminal stations, is 55 minutes. The weight of a car complete is 15.4 tons, of which 6.6 is battery and accessories and 3.75 passengers. The mean tractive effort is 26.4 lbs. per ton on the Borca rails and 13.2 lbs. on the Vignole rails.

I now come to the more important part of my communication in showing you the actual cost per car-mile of electric traction by accumulators on the lines (in actual service) from Saint Denis and Paris, and the diminution of which it is susceptible.

The actual cost is separated in the following manner:

1. Maintenance and handling of accumulators.	3.2	cents.
2. Power	3.6	"
3. Maintenance of trucks and motors	1.0	"
4. Labor	1.6	"
Total	9.4	"

The round price of 3.2 cents for maintenance and handling of accumulators may be separated into 2 cents for maintenance properly speaking and 1.2 cents for handling. This last figure is susceptible of a notable diminution.

The replacing of a discharged battery by a fresh battery requires the handling of 24 trucks, and it is sometimes necessary to roll the latter to the other end of the charging room, which represents an important expenditure of labor. For the smallest part of the installation it was possible to place the charging tables along the car tracks, and that new arrangement in suppressing the rolling of trucks permits a saving of not less than 0.6 cent per car-mile if it were applied to the whole system. Unfortunately, the depot at Saint Denis, formerly used for horse car traction, was an old stable not fit for a charging room, and it is not possible to completely modify the installation of the latter. Moreover, we have considered for a long time the substitution, for the 12 boxes of the battery under the seats of the car, of a single box suspended from the frame between the two axles of the truck. We have realized that arrangement in our new car, and it so notably reduces the labor of handling that we will hereafter adopt it in all future applications. The place of the single case of accumulators, between the two axles under the frame, is moreover the natural place. It obviates all danger of spilling of acid in the car in consequence of a too sudden stop or violent shock.

The maintenance, properly speaking, costs 3.3 cents per car-mile. It includes the renewal of the plates and of the accessories of the batteries. Naturally the renewal of the plates constitutes the principal item in the expense, and after the first month of service we fear that the power diminishes sensibly. In fact, our first plates, both negative and positive, were pastille plates, in which the active material was obtained by the reduction of chloride of lead to spongy lead. This spongy lead on the positive plates was then peroxidized by formation of the Planté type.

The life of the negative plates exceeds 90,000 car-miles, and their wear, accruing from chemical reactions produced both in the charge and discharge, is practically nil. It only enters in the maintenance item in the order of thousandths.

It is not the same with the positive plates. After the formation, their active material is composed of peroxide of lead as crystalline as the original spongy lead, and, in consequence, of great mechanical solidity; but by the normal succession of charges and discharges the crystalline peroxide of lead becomes powdery and in consequence falls to the bottom of the jar.

This fall of peroxide is fatal, and every manufacturer of accumulators who tells you of positive plates with an indefinite life deceives himself or deceives you. The average life of the first plates of tramway batteries was about 8,400 car-miles. After this travel all their peroxide of lead was fallen and their perforated support unfit for service. This latter trouble is a great deal more serious, because the peroxide of lead may be easily repasted on the support. For utilizing the latter property, we have adopted for them the primitive form which Faure gave them. It is composed essentially of a solid core on which are cast inclined shelves. These last constitute actual little reservoirs which do not hinder the fall of peroxide of lead when it has all become powdery, but which retards it. The lead of the support contains about 10 per cent. of antimony for increasing on the one hand its rigidity, on the other hand for limiting the surface oxidizability.

With the new plate the peroxide of lead separates from the support at the end of the 8,400 miles, but the latter is intact. In order to convince you, I have brought from Saint Denis some supports of plates taken at random from which all the peroxide is fallen and which is ready to submit to the operation of repasting. They are practically in the same state as when first put in service.

From experiments made here with extreme rates of discharge we are prepared to say that after ten repastings the supports of plates are not yet worn out.

We can therefore affirm that the new positive plates with shelves last at a minimum 60,000 car-miles, with the simple expense of labor for their repasting every 8,400 car-miles.

The conductivity of the positive plate with shelves is greater than the old plates with pastilles. That new quality permits us to increase the delivery per square centimeter of plate of the battery in the new car, of which I have already spoken to you regarding the handling, composed of no more than 56 elements of nine plates 200/200, of which the total weight is 3,740 lbs. The weight of old battery was 6,600 lbs.

This diminution of total weight of the battery contributes again to diminish the cost of maintenance.

In the new applications the latter falls to $3\frac{1}{3}$ cents per car-mile, handling included, which represents an economy of 40 per cent. on the actual cost of the maintenance and handling.

In our first experiment with the new car we have consumed but 70 per cent. of the energy required by the old. The factor 6 cents, which represents the consumption of actual motive power, falls therefore to 4.3 cents in the new car.

British Steam Railway Men and Electric Traction.

The International Railway Congress which has recently been meeting in London, gave comparatively little attention to electric traction. There was one good discussion on the matter of the substitution of electrical for steam locomotives on railways, and it was evident from the remarks of speakers that they realized the need for an economical and efficient locomotive. The upshot of this discussion was the adoption of a resolution to the effect "that it appeared from the result of certain trials that the establishment of a service of self-propelling carriages with transmission by means of electric conductors, somewhat similar to the system used in electric tramways, did not offer great technical difficulties." The trials are to be continued. There was one feature of the congress which augurs well for electric traction and may be regarded as a sign of the times, denoting as it does the feeling of European and other railway men in regard to the importance of electricity in its use for traction purposes, i. e., it was thought advisable that a special section of the congress should at the next meeting be alloted to the question of electric traction. If this is done, and railway men consider the matter seriously themselves as a body, we may expect some great advances within a short period.

INDIRECT ELECTROLYSIS.*

BY E. ANDREOLI.

When the central compartment of a box, A, divided into three compartments by two porous walls B B′ (Fig. 1), is filled with any solution whatever, as long as the side compartments C C′ contain, the first an anode E and the second a cathode F, in either similar or different electrolytes, the decomposition of these electrolytes in C C′ takes place as though the center compartment were entirely absent, and the solution which is in the middle compartment remains unchanged while the electrolysis takes place on both sides; it undergoes no reaction, is on the contrary inert, and is entirely unaffected by the decomposition of the anode or of the cathode solutions in the lateral compartments. But if one or more metallic plates are plunged in the solution of the middle compartment D (Fig. 2) it immediately produces reactions which can only be attributed to an indirect or secondary electrolysis.

Notwithstanding the researches that I have made, it does not appear that this phenomenon has ever been mentioned before in any work relating to electro-chemistry. I believe that I am the first, not only to announce but also to utilize this new method of electro-chemical decomposition, to which I have given the name of *indirect or secondary electrolysis.*

I shall give some explanations of what takes place between the two walls which separate several liquids.

Suppose the right and left compartments C C′ contain salt water, and that the middle one is filled with either a weak or strong solution of cyanide of gold. On the positive side C′ the electrode is a carbon spiral (charbon de cornue), and the cathode opposite is of iron.

When the current enters the box A the electrolytic decomposition takes place with the formation of chlorine at the positive pole E, and of caustic soda at the negative pole F, the solution of cyanide of gold remaining unaffected by the passage of the ions.

But if I plunge a metallic plate in the centre compartment, or what is better, several metallic plates, G G G G G, it will produce a deposition of gold on these plates, which, however, bear no relation either to the positive or negative pole of the generator or to the anode or the cathode of the neighboring compartments.

The solution of cyanide of gold in the middle, D, will not be contaminated with either chlorine from the compartment C′ or sodium from the compartment C. The middle solution, according to the density of the current and the number of plates, will be sooner or later completely exhausted.

The section (tranche) of liquid alongside of the negative compartment becomes positive, and the proof of this is that the side of a lead plate which faces this diaphragm is completely peroxydized (?) while the other side is completely covered with a sheet of gold. Metal plates placed either horizontal or vertical in the liquid section situated near the positive compartment which becomes negative, will be covered with a deposit of gold.

It follows from this that reactions of a special character may be produced, which will be evident; but I shall not consider here how these may be avoided or obtained. The only fact to which I desire to call your attention is the deposition of a metal upon metallic sheets by electro-immersion in the solution which contains it.

I have replaced the salt water of the positive and negative compartments C C′ by a solution of gold exactly similar to that which was in the middle; the anode was of lead and the cathode of iron. At the end of several days I have taken 100cc. of the solution from the side compartments, evaporated, scorified and cupelled the residues, and have established that the quantity of gold obtained was absolutely the same as that found in 100cc. of the gold solution before treatment. On the negative plate there was no trace of gold, nor was it affected by the deposition of gold from the positive to the negative pole, as occurs ordinarily in galvanoplastic operations, while during the same time I have been able to exhaust nearly 100 litres of the gold solution in the central compartment?

---

* Translated from "Le Genie Civil."

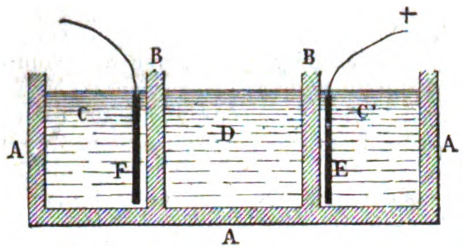


Fig. 1.

Another adaptation of this indirect electrolysis has enabled me to transform bisulphide of sodium into hydrosulphite. We know that the ordinary electrolysis of the compounds of sulphur, and consequently of the sulphides or bisulphides, is impracticable. Indirect electrolysis effects in the most simple, easy and rapid manner the change of a solution of bisulphite into hydrosulphite without the need of having it concentrated to 35 or 40 degrees Baumé.

Here again the nature of the liquids in the lateral compartments is of little importance. The best conductors should be chosen which do not require special electrodes. The decomposition of the solution of bisulphide of sodium alone is interesting. From a special reservoir I have led the solution into the central compartment D, and, as in the deposition of gold, no effect was produced when only one metallic plate was plunged in the electrolyte (I generally used perforated plates); but as soon as I had immersed two, one on the positive side and the other on the negative, the reaction took place with a marked evolution of gas; the liquid soon acquired bleaching (discoloring) properties which it did not have before, and if it was poured from the central compartment into a reservoir containing wool it rapidly whitened it. When it is partially or totally exhausted it may be revived in the compartment where the indirect electrolysis takes place, and this for a number of times before it will be necessary to reinforce the liquid by adding bisulphite to it.

The old books teach us that in an electrolyte the operation takes place between the two poles like an unbroken chain of molecules, and that each metallic plate interposed between the anode and the cathode becomes positive on the side which faces the negative pole, and vice versa. But it is evident that in the measure that a plate is farther from a pole so the resistance increases, until finally there will be no result.

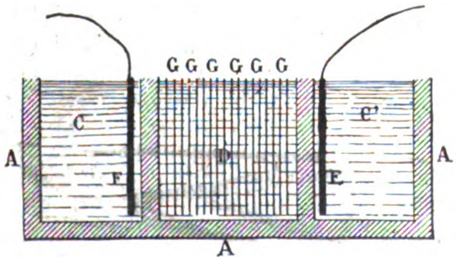

Fig. 2.

Finally, in this transmission of current between two poles separated by the plates there is but *one liquid*; and I mention this so that no one will mistake an old experiment in electrolysis for the indirect electrolysis which I have summarized here, and which shows the curious phenomenon, in contradiction to the scholars, of transferring the ions from one extreme compartment to the other, and vice versa, across an inert electrolyte which they do not affect; that is to say, they make it neither acid nor alkaline. It is sufficient in preparing and utilizing this electrolyte, whatever it may be, to place the plates or the metallic conductors—perforated or not—or the grids (grillages) so that a very long section of the electrolyte will be influenced by the change of polarity, to act, so to speak, like a negative liquid electrode alongside of the positive compartment, and reduce gold, silver, etc., which it deposits on the plates that are not connected to the anode, the cathode, or to the generator of electricity.

As I said above, there are several precautions to be taken in order to secure good results. I will indicate them in the future. I say nothing good or ill of this indirect electrolysis now, which has its defects as well as its advantages. I have used it for some time, and it has led me to adopt some modifications in electrolytic work which have commended themselves to me. My aim has been simply to indicate a method of electrolysis which I believe is new, and which differs considerably from the ordinary, since instead of two compartments my box contains three, and that between these two electrolytes, one supplied with an anode and the other with a cathode, there is another which operates independently in a compartment without anode or cathode connection to the electrical generator, and in which the decomposition of any liquid whatever may be effected.

If we only consider the question of electro-deposition, secondary electrolysis does not at all resemble the ordinary process, for the liquid in which my anode is plunged is neither a gold nor a silver bath. It is not on the electrode of the cathode compartment that the deposit is effected; it is, on the contrary, on the pieces of metal which are in the central compartment where the gold or silver solution is found, which can be as weak as desired without impeding the operation that I can carry on until the electrolyte is exhausted. This method is applicable to other operations than the deposition of metals and the formation of hydrosulphite for the bleaching of wool, etc.

I hope this explains with sufficient clearness the function of indirect electrolysis, which I have freed from all explanations relative to certain reactions which are inevitable, and I shall be pleased to hear the criticisms of the electro-chemists who may take an interest in this new method of electrolytic decomposition.

LONDON NOTES.

(From our Special London Correspondent.)

THE BOARD OF TRADE AND ELECTRIC LIGHTING REGULATIONS.

Copies of proposed new rules have lately been sent around to town councils and local governing bodies which already have their own electric lighting stations, for them and their engineers to send in suggestions of any further alterations or additions they consider advisable. The proposals of practical electrical engineers, actually engaged in electric lighting work should constitute a useful supplement to the tendered suggestions of the Board of Trade officials.

The Islington Vestry considers one clause in particular highly objectionable. It is to the effect that all conduits and receptacles should be so constructed as to prevent an influx of gas from adjacent soil. The Vestry thinks this will give too much freedom to the gas companies, instead of making them prevent escapes from the mains.

The Dundee authorities consider the leakage current allowed (one-thousandth of the maximum supply current) too small.

THE ROWLAND-FORBES CONTROVERSY

In the *Electrical Engineer* of July 3 last there appeared a letter from Prof. Henry A. Rowland in answer to some remarks made by Prof. George Forbes in an interview published in London *Lightning* on the connection of the two gentlemen with the work on the Niagara Falls plant. The following reply from Prof. Forbes appears in *Lightning* for July 11:

PROF. FORBES'S REPLY.

The above letter requires refutation on two points—(1) that Prof. Rowland had anything to do with the plans adopted for Niagara, (2) that the extract from one of my confidential reports is the specification which I sent out to manufacturers to bid upon.

I.—PROF. ROWLAND'S CLAIMS.

1. The officials of the Niagara Company have informed me and others that he was employed only to get him to withdraw his opposition to alternating currents. To do this they gave him one (and only one) of my reports to them which dealt with this point, and they got me and others to instruct him. At our first meeting he stated *ex cathedrá* that the Tesla motor was of no use; but cross-examination proved that he did not understand the principle of its action. Seven months of instruction reversed this decision.

2. So useless was his report to the company that it was not shown to me until I had completed all my plans and decided on the dynamo design.

3. His report did nothing except to recommend the dynamo proposed by a certain firm, to whom, at the same time, he was trying to sell some patents for transformers. This dynamo was totally unsuitable.

4. His pitiable lawsuit showed, by the evidence of the company's officials, that he had nothing to do with the plans for our work, and that the directors relied entirely upon the advice and inventive capacity of their electrical consulting engineer.

II.—MY SPECIFICATION FOR A DYNAMO.

1. *The quotation in Prof. Rowland's letter is not the specification I sent to manufacturers.* This accounts for much of his misunderstanding. That specification filled twelve pages of printed foolscap, was accompanied by twelve sheets of drawings, and was never shown to Prof. Rowland. My paper in 1893 to the I. E. E. contains an abstract.

2. The report of thirty-six pages which he read says at the end that it is *not* a final report; but it is a very good general account of the plans we have adopted. It is absurd to say I opposed what we have done. As the consulting engineer, I originated it and carried it all through.

3. What he quotes as my specification was a suggestion I made when a separate fly-wheel was thought necessary, as this was the only type (like the Siemens or Ferranti) which could possibly bring the weight down to what we were absolutely limited to, and if it could be made strong enough it was the best type electrically. That suggestion of a specification was guarded by the prefatory words, "*if* a thoroughly good machine, electrically and mechanically, can be designed on these principles, it ought to comply with the following specification." From designs I worked at it seemed possible, but I was not over sanguine, and I had not then hit upon the novel design of alternator with external revolving field, which did away with the necessity for a fly-wheel, which completely solved the problem, of which I sent out specifications which I caused to be constructed, which was described and illustrated in my paper to the I. E. E. about which Mr. Kapp in the discussion said it was the best possible design for the purpose, and for which the Company formally thanked me in writing as having saved them from a most awkward dilemma. I could not, however, with this design use so low a frequency as I desired.

I could say a great deal more, but do not wish to take up more of your valuable space. I wish it to be known, however, that Prof. Rowland's misconceptions are largely due to the fact that we did not think it necessary or advisable to inform him of what we were doing.

George Forbes.

34 Great George st., Westminster, July 9, 1895.

NORTHWESTERN ELECTRICAL ASSOCIATION.

The meeting of the Northwestern Electrical Association at the Leland House, Chicago, on the 17th, 18th and 19th was not largely attended. Papers were read by Messrs. J. S. Stephens, A. V. Abbott, W. D. Jameson, George Cutter, J. C. McMynn and Prof. D. C. Jackson.

The following officers were elected: President, George Grimm, Jefferson, Wis.; Vice-Presidents, Pliny Norcross, Janesville, Wis.; P. H. Korst, Racine, Wis; Secretary, William Goltz, Milwaukee; Treasurer, John Schuette, Manitowoc; Trustees, F. A. Copeland, La Crosse; O. M. Rau, Milwaukee; E. M. Highlands, Clinton, Iowa.

The next meeting will be in Milwaukee in January.

Prof. Forbes's Serious Charge.

In the "reply" of Prof. Forbes to Prof. Rowland, printed on another page, the former says: "The officials of the Niagara Company have informed me and others that he (Rowland) was employed only to get him to withdraw his opposition to alternating currents." This is a serious charge, the truth or untruth of which is a far more important matter to the community than any other question at issue in this whole matter. We expect Prof. Rowland to take such action as men of repute do when grossly libelled. It is, even if untrue, a public confession that the Niagara Company does not hesitate to resort to bribery in the conduct of its business.

New Electric Road at Niagara.

The Niagara Falls and Lewiston Electric Railroad was opened for passenger traffic last week. The road is located in the Gorge, and is only twenty feet above the level of the river. The cliffs which overhang the road vary in height, being in some places nearly 300 feet high. The line is double-tracked, and carries passengers so close to the Whirlpool rapids that the spray is dashed upon the cars.

Personal.

Mr. J. Z. Miller, Jr., who is interested in the establishment of an independent telephone exchange at Belton, Tex., was a New York visitor this week.

Mr. Henry Sachs, late manager of the Beacon Vacuum Pump and Electrical Co., is now established with offices in the Equitable Building, Boston, where he will conduct a general brokerage business, electrical stocks being a specialty.

Mr. James W. Godfrey sails for Europe to-day, July 24, to meet his family, who have been abroad for some months.

JAMES W. GODFREY.

On Monday evening a score of friends joined Mr. Godfrey at dinner at Moquin's in Ann street, where he received a good deal of instruction as to his trip abroad. ELECTRICITY hopes to print a brief account, from time to time, of Mr. Godfrey's travels, which can not fail to be interesting.

THE SIEMENS & HALSKE ELECTRIC COMPANY OF AMERICA.

New Officers Chosen.

At the election of the Siemens & Halske Electric Company of America on the 15th inst. the following gentlemen were chosen:

President—A. W. Wright.
Vice-president—Charles E. Yerkes.
Secretary—F. B. Badt.
Treasurer—O. W. Meysenburg.

Directors—Arnold von Siemens and Georg Wilhelm von Siemens, of Berlin; O. W. Meysenburg, A. W. Wright, Charles E. Yerkes, W. F. Furbeck, David B. Lyman and F. B. Badt, of Chicago; Martin Maloney, of Philadelphia.

Of the new officers Prof. Badt needs no introduction to our readers. Since his retirement from the G. E. Company, a year or so ago, he has been manager of the sales department of the Siemens & Halske Company. Mr. Yerkes is a son of Charles T. Yerkes. Mr. Furbeck represents the Yerkes interest, and Mr. Lyman is the trustee of the Grant Locomotive Works. Sir William Van Horne who retired from the Board, retains all his interest in the company but was unable to give further time to the business. Mr. Meysenburg positively refused to serve again as president, as he desires to give a portion of his time to other enterprises, chiefly the Wells & French Company.

The statements made in the daily papers that the Yerkes interest in the Siemens & Halske Company is the dominating one is absolutely incorrect. There is no struggle for control, but while Mr. Yerkes is the largest individual stockholder, the Wright-Meysenburg and Berlin interest is still easily larger than all others.

It is finally determined that an important feature of the business shall be the manufacture of steam locomotives.

Annual Meeting of the Westinghouse Co.

The annual meeting of the Westinghouse Electric and Manufacturing Co. was held at East Pittsburg on July 17. A large delegation of stockholders and visitors was present to inspect the new works and the surface-contact railway system which has been described in ELECTRICITY.

The old Board was re-elected, as were the former officers. The results of the year's business were printed two weeks ago.

No New Trial for Henri Bier.

Judge Moise, at New Orleans, has refused to grant a new trial to Henri Bier, recently convicted of perjury and sentenced to the penitentiary.

LEGAL NOTES.

The W. S. Hill Electric Co. of Boston has assigned for $20,000 to Attorney F. A. Wyman. Mr. Wyman says he can make no statement at present of the liabilities and assets of the company. Mr. Wyman believes that the company, which he says is doing a good business, will continue.

The Eastern Electric Cable Company of Boston has begun a suit in chancery to force the trustees for the creditors of the defunct Detroit Electrical Works to sell the assets of that concern and divide them among the creditors.

An attachment has been filed in the Essex (Mass.) Registry against the General Electric Company of Boston by Lewis M. Packer of Lynn in the sum of $50,000 in an action of tort.

Duncan Edwards has been appointed receiver for Neftel, O'Connor & Co., electrical contracting engineers, whose office was formerly at 126 Liberty street, New York, on the application of John A. Roebling's Sons Company. Bernard F. O'Connor, the treasurer of the company, obtained an attachment against it some time ago for $11,000.

General News.

What is Going on in the Electrical World.

Lowell, Mich.—The village authorities are advertising for bids for an electric light plant.

Delhi, N. Y.—The survey for an electric road from Delhi to Bloomsville has been made by Engineer Peters.

Columbus City, Ala.—A Boston company is putting in a plant to manufacture electric apparatus in this town.

Humboldt, Tenn.—The citizens of Humboldt by a large majority have voted bonds for waterworks and electric light.

St. Johns, Mich.—This city has voted to bond itself for $35,000 to purchase a local electric light plant (R. M. Steele's).

McComb, O.—W. A. Shelt, of Napoleon, has made the village of McComb a proposition to put in an electric light plant.

Mt. Sterling, O.—The people of this place at the special election voted in favor of bonding the town for electric lights and waterworks.

Brooklyn, N. Y.—The State Electric Light and Power Company has been granted an extension until November next to begin work.

Fort Fairfield, Me.—Steps are being taken toward establishing an electric light system in Fort Fairfield, the plant to be at Stevens's mills.

Norfolk, Va.—The electric railway line from Norfolk to Ocean View, the favorite seaside resort of the F. F. Vs., has been opened to traffic.

Mankato, Minn.—The proposition to issue $10,000 bonds for an electric light plant was carried by a large majority at the recent special election.

Brunswick, Ga.—Negotiations are in progress here for the franchise of the old horse-car line, with the view of changing the line to an electric road.

Escanaba, Mich.—The city is negotiating for the purchase of the electric lighting plant now owned by a private corporation. Mayor Gallup strongly urges the purchase.

Scranton, Pa.—Representatives of a New York syndicate have been here lately making examinations as to the advisability of locating a large electrical plant in the city.

Westport, Conn.—The Westport and Saugatuck Horse Railroad has gained legislative authority to increase its capital stock to $100,000, to extend its line and to equip it with electricity.

Utica, N. Y.—Application has been made by the Utica and Herkimer Street Railway Company for consent to build and operate a surface railway in Utica to be operated by electric power.

Zanesville, O.—Ex-Auditor Patterson, A. W. Evans and L. W. Doane, of this city, have presented a petition to the county commissioners for a right of way to construct an electric railway to Hebron.

Westfield, Mass.—The directors of the local street railway have intimated that the equipment of the road with electricity by the middle of September or the 1st of October is very probable.

Woodbine, Pa.—The electrical appliances for the clothing factory here have been completed. All the sewing machines are now run by this power and even the sadirons are heated by electricity.

Pittsburg, Pa.—The Pittsburg and Finleyville Traction Company is the name of a company projected to build an electric railway bringing Finleyville into closer connection with this city.

Allentown, Pa.—It is stated that President Al. Johnson of the Traction Electric Railway Company of this city and Bethlehem has bought all the stock of the minority stockholders in that corporation.

Panama, Col.—Several Americans have submitted to the Government proposals for the construction of the electric light plant, and the Government seems disposed to accept them.—Carthagena advices state that a boiler in the electric light plant in that city exploded on the 2d inst., wrecking the building and machinery.

Staunton, Va.—Some Eastern men interested in constructing a trolley railroad from Basic City to Bridgewater have recently been over the route and arranged for right of way; they met with much encouragement.

Bloomington, Ill.—The principal stockholders of the two local electric light companies have held consultations lately in regard to uniting the companies, and it looks as if the union would take place.

Greenfield, Mass.—The Greenfield, Turner's Falls and Montague Electric Street Railway Company has just filed its third petition with the selectmen, praying for a franchise to enter the town of Greenfield.

Sparrows Point, Md.—The Maryland Steel Company, at Sparrows Point, have found the use of electrical power in their shops preferable to steam, and have decided to make a number of changes along this line.

Guthrie, Ok.—The citizens are clamoring for better light than that furnished by the present electric light plant, and demand that the plant be enlarged or entirely replaced by improved machinery and equipment.

Fairfield, Ky.—About $20,000 has been subscribed towards the stock for building the proposed electric road from Louisville to Fairfield. B. H. Bridwell of Fairfield and James McKinney of Louisville are interested.

Kansas City, Mo.—It is reported that the old East Fifth street railway, which has not been in use for several years, is to be rehabilitated, but it has not been decided whether electricity or steam will be used in its operation.

Athens, Ga.—The city council has decided to call upon the people to vote bonds to the amount of $25,000 for the purpose of putting in an electric light plant. The contract with the lighting company is about to expire.

Mt. Vernon, N. Y.—The North Mount Vernon Surface Railroad Company has voted to increase its capital stock from $20,000 to $250,000, for the purpose of extending its trolley line to Tuckahoe, Bronxville and White Plains.

Paragould, Ark.—R. M. Harrison of the Harrison Electric Company of Chicago, with J. D. Block and others of Paragould, are promoting an electric line from Siloam Springs, Ark., through Paragould to Gayoso, Mo., on the Mississippi River.

Ocala, Fla.—Meetings have been held here to discuss the project of an electric road from Ocala to Silver Springs. There was a general expression of opinion in favor of the scheme. Mayor Reardon, of Ocala said there was great need of the line.

Shawano, Wis.—Sealed proposals will be received at office of city clerk, until August 1, for furnishing electric lights and waterworks for Shawano, the bids to be separate and in accordance with specifications on file in the office of the clerk of the city.

Derry, N. H.—At a meeting of the directors of the Chester and Derry Electric Railroad Company, Charles Bartlett of Derry and A. B. Wilcomb of Chester were appointed a committee to have a survey of the proposed road made. The estimated cost of the road is $50,000.

Charleston, S. C.—It seems probable that the deal by which a Northern syndicate was to get control of the street railroads here and change the motive power to electricity has fallen through owing to failure to make money arrangements. The syndicate had put up $5,000 as a forfeit.

Black River Falls, Wis.—The La Crosse and Neillsville Electric Railway Company has secured a thirty-day option on the Spaulding water power in this city, with a view of purchasing the same. The power is one of the finest in the State and has been valued as high as $100,000.

Shelbyville, Ind.—The Batesville and Oldenburg Electric Railway Company has perfected its organization by electing the following officers: President, B. S. Sutton; vice-president, A. A. Wackman; secretary, John A. Tindall; treasurer, Jonas Joseph. The capital stock is $100,000.

Kingston, N. Y.—An examination of the proposed route for an electric railway between Newburg and Kingston has been made by parties interested. Farmers have given assurances of a free right of way. It is understood that the West Shore Railroad people would like to see the road built.

Gardiner, N. Y.—There is some talk of building an electric railway from the condensery at Wallkill to Ireland Corners, chiefly for the accommodation and benefit of the milkmen in this vicinity. The road, according to the story afloat, will be constructed and controlled by the New York Condensed Milk Company.

Dayton, Ky.—The board of councilmen of this city will receive sealed proposals until August 5 for lighting the city with 38 or more electric arc lights for a term of five years from October 29, under the conditions set forth in the present electric light ordinance and contract on file in the office of C. H. Hayward, city clerk.

Pittsburg, Pa.—Bernardo Paladini, formerly Consular Agent of the Italian Government for the western district of Pennsylvania, who also held an important position with the Westinghouse Electric and Manufacturing Company, has resigned and is now on his way to Caracas, the capital of Venezuela, to establish trolley railways and electric lighting in that country.

Long Branch, N. J.—The commissioners have voted to give the Atlantic Coast Railway Company permission to run their trolley road through Long Branch. The road was opposed by the wealthy cottage owners at Elberon and Long Branch, but the business men favored the scheme and demanded that the authorities give the company the franchise.

Ann Arbor, Mich.—Sealed proposals will be received until August 1 for lighting the streets and public places of this city for a term of five years, beginning December 31, with not less than 96 arc lamps of 2,000 candle power and 3 incandescent lamps of 65 candle power each, for 265 nights all night, 365 nights from twilight to 12.30. Glen V. Mills, city clerk, will furnish information.

Washington, D. C.—The electric equipment of the 9th street branch of the Metropolitan Railroad is nearly in place and the officials of the company are confident that the cars will be running regularly under the new system by August 1, as required by law.—Steps have been taken toward the building of an electric road connecting Silver Spring, Woodside, Linden and Forest Glen with Washington.

Riverhead, N. Y.—A syndicate of New York and Philadelphia capitalists want to construct and operate, subject to the statutes of the State, a trolley railroad in the main highway, extending from Riverhead to Orient, L. I. It is proposed to build the road, providing a right of way will be given by those living on the highway. Several prominent local capitalists have been interested in the scheme.

Milwaukee, Wis.—A resolution has been introduced in the city council authorizing the board of public works to advertise for bids for lighting the city with electric lights. The contract with the Badger Illuminating Company expires January 1. The Milwaukee Arc Light Company, successor of the old Milwaukee Electric Light and Power Company, will probably make a bid for the contract in competition with the Badger Company.

Erie, Pa.—The *Herald* says: "The electric railway people are being attracted by the prominence of Conneaut Lake as a pleasure resort. Capitalists have a scheme on foot to construct a road from Meadville and another from Meadville to Titusville. If carried out as outlined, the road will measure 45 miles in length, and Meadville, lying between the termini, will be the headquarters. Application for a franchise has been made to the Meadville councils."

Baltimore.—The big electric locomotive in the Belt line tunnel was put to a severe test a few days ago and came off with flying colors (at a gait of 17 miles an hour). A train of 23 cars and 2 "dead" engines was hauled through the tunnel at that speed by the big machine. The estimated weight of the train was 1,300 tons. After the trip through the tunnel was made two large steam locomotives were required to pull the train.

Columbus, O.—A fee of $16,000 was paid at the State Department on the 13th inst. It came from the new Cincinnati, Hamilton and Dayton Railroad Company, formed from the consolidation of the Cincinnati, Hamilton and Dayton, the Cincinnati, Dayton and Ironton and the Cincinnati, Dayton and Chicago railroad companies. The consolidation was perfected some time ago, but the formal articles were not filed until the date given.

BUSINESS HINTS.

Public Buildings, Theaters, Residences, &c., Proposed or in Course of Construction.

[The following summary is prepared weekly for ELECTRICITY for the information of advertisers and readers who are dealers in apparatus and articles required in the electrical equipment of public and private buildings.]

Atlanta, Ga.—Salem Graham, of Palatka, Fla., will build in this city a 140 room hotel.. . Venable Bros. will remodel the Venable Building into a 200 room hotel with electric light plant and other conveniences.

Boston, Mass.—John B. Thomas and Edward Read, representing a syndicate of which Francis Peabody, Jr., Alfred Bowditch and others are trustees, have secured a site at 413-421 Boylston st. for a building devoted exclusively to the medical and kindred professions; estimated cost $550,000....Charles F. Atkinson, of the Bowdoin Square, has closed negotiations, plans, etc., for the erection of a first-class theater on the site of the old public library on Boylston st.

Brooklyn, N. Y.—George Campbell will erect a five story brick flat and store, south side of Fulton st.. west of New York ave.; also 2 five story brick flats and stores on south side of Fulton st., west of New York ave....John Frazier, 45 Rochester ave., will erect a four story brick flat at northeast cor. of Park Place and Nostrand ave....Emily Mannecke will build 3 five story brick apartment houses on north side of Fulton st., east of Arlington Place....Frank Freeman, 808 Vanderbilt Building, New York City, is the architect for the new police station to be erected cor. Throop and Gates ave., Brooklyn; heated by steam and lighted by electricity.

Burlington, N. J.—H. H. McNeal, Philadelphia, Pa., is to have a handsome colonial residence erected here.

Cape May, N. J.—A new brick hotel, to cost $150,000, will be erected this fall on the site of the new Columbia which was burned in 1880.

Chicago.—Moulton & Richardson, who are building the Guaranty Building at Buffalo, N. Y., have broken ground for an eighteen story building in Chicago.

Hartford, Conn.—Architect Dwyer has prepared plans for the Linden apartment building to be erected on Capitol ave.; lighted by electricity.

Harper's Ferry, Va.—The Baltimore & Ohio Railroad Company are contemplating the construction of a summer hotel on Maryland Heights, opposite Harper's Ferry.

Irvington, N. Y.—A number of millionaires living along the Hudson have decided to build a casino at Irvington.

Maysville, Pa.—The Shamokin and Mt. Carmel Electric Railway Company contemplate erecting a large pavilion on the park at Maysville. It is to contain a place for theatricals, a cafe, etc.; lighted by electricity.

New York City.—The Central Real Estate Association, which purchased the southwest cor. of 4th ave. and 19th st., will immediately erect thereon a twelve story fireproof building to cost about $750,000....Architects Parrish & Schroeder, 1 Madison ave., have prepared plans and specifications for the new club house for the Y. M. C. Association at 321 West 56th st....It is reported that Charles Buek, who filed plans for two private houses on 72d st. between the Boulevard and West End ave., has changed his mind, and will build a nine story flat on the two lots instead....The seven story and basement mercantile building to be erected at 7-9 West 18th st. for H. Corn will be lighted by electricity; passenger and freight elevators, etc....Julius Franke, 287 4th ave., is the architect for the seven story store and loft building to be erected at 179-183 Wooster st....Ralph S. Townsend, 1298 Broadway, has plans for a fifteen story fireproof office building, to be erected on the northeast cor. of Cedar and William sts., for Blake & Downing....Horenburger & Straub have made plans for a six story factory building to be erected at 81-83 Ludlow st., for Purdy & Co., of Boston. ....A seven story brick and stone and iron factory building will be erected at 20-24 North Moore st., to be equipped with power plant and machinery....Architects Clinton & Russell, 32 Nassau st., have completed plans for 5 four story buildings to be erected in 55th st., west of 5th ave.; they are to be lighted by gas and electricity and equipped with the latest improvements....Dr. Thomas E. Satterthwaite will build a five story and basement residence south side of 55th st., west of 5th ave.; Architect Wm. Strom....W. E. Thompson, 309 Columbus ave., will build 4 five story dwellings at 302 to 306 West 78th st.

Paterson, N. J.—Francis Seymour and others will build a new hotel and theater cor. Clark and Ward sts.

Philadelphia.—The edifice to be erected in Germantown at Frank and Green sts. by the Summit Presbyterian Church will be lighted by electricity.

Pittsburg, Pa.—Burnham & Co., of Chicago, have furnished the plans for the new hotel to be erected on Penn ave. by John Walker and Henry Phipps, Jr.

Pottsville, Pa.—The county commissioners have received the plans for the electric light and heat plant for the new hospital building.

Providence, R. I.—It is proposed to erect a large hotel on a site leased from the Britt estate in Washington st.; estimated cost $1,500,000.

Rockaway Beach, N. Y.—Henry Ives Brown, of New York City, has made drawings for a new hotel to be built at Rockaway Beach for John Hanley; lighted by electricity.

Wheeling, W. Va.—The Pythian Temple Association of Wheeling has selected a site upon which to erect the proposed temple; Capt. George W. Weisgerber is chairman of the committee on construction.

INCORPORATIONS.

The West Brokerage Company, San Antonio, Texas—to construct a telegraph line. Capital stock, $10,000. Promoters: J. M. Ryan, Paul Richards and J. R. Ransom.

The Conway Telephone Company, Conway, Ia.—to operate a telephone exchange. Capital stock, $5,000. Promoters: Arthur Hayne, president, and M. H. Simmons, secretary.

The Iowa Harrison Telephone and Construction Company, Council Bluffs, Ia. Capital stock, $100,000. Promoters: C. E. H. Campbell, S. B. Wadsworth, A. W. Johnson and C. M. Hurd.

The Douglas County Telephone Company, Madison, Wis.—to operate a telephone exchange system. Capital stock, $30,000. Promoters: Russell Baxter, P. Benson and P. G. Stratton.

The Southern Electric Construction Company, Richmond, Va.—to construct and equip telephone plants, electric light and power plants, and do a general electric business. Capital stock, $25,000. Incorporators: J. M. Collingworth, president; C. F. Wingo, vice-president; G. S. Maxwell, secretary and treasurer.

The Electric Shower Bath Company, Chicago. Capital stock, $30,000. Incorporators: Levi Beemer, Michael J. Lyons and William A. Cunningham.

The Peoria and Fort Clark Street Railway Company. Peoria, Ill.—to acquire, build, buy, own and operate street railways and plants for producing electricity, and to use, furnish and sell electricity for operating street railroads, for light, heat and power purposes. Capital stock, $150,000. Promoters: Wm. Burry, Emory D. Frazer, Chas. S. Williston.

The Hall Electric Power and Transportation Company, Des Moines, Iowa. Capital stock, $510,000. Incorporators: T. G. Hall, G. R. Burbank, A. H. Hatch, R. H. Laird, L. C. Dancey and T. M. Hall. Mr. Laird is the president and treasurer, Mr. Dancey is secretary and T. M. Hall is vice-president.

The American Synthephone Company, Chicago, Ill.—to manufacture, buy and sell electrical appliances and all kinds of machinery and products, including inventions and letters patent therefor. Capital stock, $1,000,000. Promoters: Wm. S. Adams, Ada C. Adams, Louis M. Stone.

The Ideal Electric Corporation, Camden, N. J., and Philadelphia, Pa.—to manufacture, install and maintain electrical apparatus. Capital stock, $100,000. Promoters: Geo. L. Colgate, Fanwood, N. J.; Jas. D. McIntosh, Franklin, N. J.; Geo. S. Loutey, Wm. C. Toplin, James Collins Jones, Philadelphia.

The Coro and Lavela Railroad and Improvement Company, Jersey City, N. J.—to construct, build and operate a railroad to be operated by steam or other motive power between Coro and Lavela, Venezuela. Capital stock, $500,000. Promoters: Adolph Pereira, Francisco Bonilla, Brooklyn, N. Y.; Geo. L. Dayton, Jersey City.

The Crandall Electric Signal Company, Jersey City, N. J., and Washington, D. C.—to manufacture and sell electrical devices for the display of signals, monograms, figures, words, designs, etc. Capital stock, $500,000. Promoters: Lucien S. Crandall, Parish, N. Y.; James Curran, Hoboken, N. J.; Geo. B. Fielder, Jersey City; Chas. F. Manderson, Omaha, Neb.

The C. E. Woods Company, Chicago, Ill.—to engage in electrical and mechanical engineering, contracting and general supervision of mechanical and electrical construction work. Capital stock, $100,000. Promoters: Chas. E. Corrigan, Clinton E. Woods, James R. Corrigan.

The Yarmouth Telephone Company, Yarmouth, Maine—to manufacture and deal in electrical goods and supplies and construct and maintain telephone lines, etc. Capital stock, $10,000. Promoters: Albert H. Coombs, John Coombs, Geo. E. Coombs, Yarmouth.

The Metropolitan Gas and Electric Light Company, San Jose, Cal.—to manufacture, purchase and sell gas; generate and sell electricity, electric light and power; build or purchase and operate railroads to be run by electricity. Capital stock, $500,000. Promoters: J. V. Mc. Kiernan, Frank Whitaker, E. C. Randall, W. W. Wood, C. K. Fleming, San Jose.

The Big Horn Gold Mining Company, Los Angeles, Cal.—to operate and improve lands, mill sites, mining claims, electric lines, water rights power plants, etc. Capital stock, $2,000,000. Promoters: L. W. Blinn, E. M. Ross, Stephen M. White, F. L. Moore, all of Los Angeles.

The Webber Brake Company, Jersey City, N. J.—to manufacture, buy and sell railway supplies, which pertain to construction, equipment, etc., of electric and street railways. Capital stock, $50,000. Promoters: Geo. O. Lord, Clifton, N. Y.; Fred'k S. Greene, Bayonne, N. J.; Otto R. Saint, New York City.

The Lampasas Electric Light Company, Lampasas, Texas—to supply light, heat and power. Capital stock, $10,000. Promoters: J. T. Donovan, Sr., E. A. Maxwell, W. L. Donovan, W. H. Browning, J. C. Matthews, Lampasas.

The Kane Street Railway Company, Kane, Pa.—to build an electric street railway. Capital stock, $6 (00. Promoters: C. H. Kemp, Thos. L. Kane, W. P. Weston.

The Arcade Mutual Electric Light Company, Cincinnati, Ohio—to manufacture, sell and furnish electric light, heat and power. Capital stock $15 000. Promoters: Oliver E. Conner, Louis F. E. Hummel, Fred. Seibert, John C. Greene, M. L. Robertson.

The Easton Power Company, Jersey City, N.J.—to manufacture and sell electrical machinery and appliances. Capital stock, $100,000. Promoters: Howard Lacy, Albert B. Carter, Thos. A. H. Hay, Wm. O. Hay, Easton, Pa.; Asa W. Dickinson, Hackensack, N. J.

The Mexia Lighting and Power Company, Mexia, Texas—to furnish light and power by electricity. Capital stock, $15,000. Promoters: Jno. W. Shoaf, W. L. Murphy, W. L. Hall.

The Alton Railway and Illuminating Company, Alton, Ill.—to construct, maintain and operate street railways by animal, dummy or other motive power; generate and provide steam, gas and electricity for the purpose of operating street railways; sell and distribute steam, gas and electricity for light, heat and power. Capital stock, $250,0.0. Promoters: Jos. F. Porter, Charles W. Milnor, Henry R. Phinney.

The West Shore Railway Company, San Francisco, Cal.—to construct and operate a railroad to be operated by steam, electricity or other motive power; construct and operate telegraph and telephone lines and operate steamboats. Capital stock, $2,000,000. Promoters: C. H. Sanger, San Leandro; Behrend Joos, John W. Eisenrieth, San Francisco; Louis F. Dunand, San Rafael; R. S. Thornton, Colma, Cal.

The Merrill Telephone Company, Merrill, Wis.—to construct and maintain a telephone line in Merrill and adjacent points. Capital stock, $10,000. Incorporators: H. A. Foster, H. P. Fohlandt, C. A. Norway and others.

The Washington, Sandy Springs and Baltimore Electric Railway Company has filed a certificate of incorporation at Annapolis, Md. Capital stock, $1,500,000. In addition to operating an electric railroad, the projectors propose in their papers of incorporation a telegraph and telephone line, also to furnish electric light and water power.

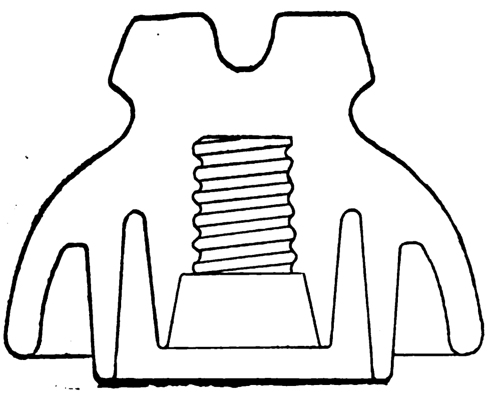
The Montgomery County Telephone Company, Hillsboro, Ill. Capital stock, $6,000. Incorporators: Charles A. Ramsey, Jacob J. Frey and William S. Barry.

The Manheim Electric Light. Heat and Power Company, Manheim, Lancaster County, Pa. Capital stock, $20,000.

The Radnor Electric Passenger Railway Company, chartered at Harrisburg, Pa.—to build an electric road beginning in Radnor township, Delaware County, and extending westerly along the old Lancaster road to its intersection with the Philadelphia and Lancaster turnpike. Capital stock, $80,000. President, Henry Douglass, of Philadelphia; directors: Andrew J. Reilly, Albert Layton, David Pepper, Frank E. Schermerhorn, Frank H. Hawkins, Lincoln L. Eyre and H. A. Mullen.

High Potential Porcelain Insulators.

Fred M. Locke, Victor, N. Y., manufacturer of a high class of line material and specialties, is now filling an order for 3,600 of his special High Potential Porcelain Insulators. They are to be used on the long distance transmission line between Nevada City and Grass Valley. Col., the voltage of which is to be 5,500.



INSULATOR—CROSS SECTION.

These insulators are of a new pattern, as shown by the accompanying cross sectional plan. They are made from the highest grade of porcelain, are 5¼ inches in diameter and weigh about two and one-quarter pounds each. The design of the insulator especially adapts it for use where structural strength and high insulation are necessary.

Partridge Motor Brushes.

The Partridge Carbon Company, Sandusky, O., reports that much of the carbon motor brush trade is coming its way, more brushes being sold now than ever before in the history of the company. Even the Carbon combine cannot get along without this company's goods and buy them when they strike a customer who insists on having a good article.

The New "Standard" Arc Lamp.

Probably no exhibit at the Northwestern Electrical Convention attracted more attention than the new Arc Lamp recently placed on the market by the Standard Electric Company of Chicago, and of which more than a thousand are now in use. In exterior appearance it is similar to the former type of Standard lamp, but when the cover is lowered the marked simplicity of the mechanism is apparent. As this lamp is a prime favorite with Mr. Perry, it was perfectly natural that he should find pleasure in debating on its good qualities; how the potential of the arc remained just the same regardless of the position of the clutch, the lamp magnets always being in perfect electrical balance; how an instantaneous and silent arc was always assured; how the present arrangement of the magnets does away with the necessity of perfect cleanliness to insure economical and satisfactory service, a point that ought to be brought to the attention of Mr. Roche, who controls the lamps in the La Salle street tunnel, the dustiest place in Chicago. It is claimed that the potential of the arc never rises above 50 volts or drops below 46, and though the amperes should vary from 5 to 15 still the arc will form silently and instantaneously at the normal voltage and so remain. As the contact points in the automatic cut-out are of platinum there can be no corrosion and the lamp cuts out without a spark. For conducting the current to the carbon rod there is a substantial brush capable of carrying more than 20 amperes. The brush is so arranged that the friction upon the rod is reduced to a minimum. For outdoor service each lamp is provided with a double pole weatherproof switch which is enclosed in a compact "detachable cap," and is so constructed as to permit the lamp being instantly removed from the line without opening or breaking the circuit.

Comparative Tests of Columbia and Edison Lamps.

A recent comparative test of Columbia and new type Edison lamps shows that the Columbia is not only of longer light and higher sustained candle power than its cheap rival, but that after 780 hours' burning it shows a saving of .5 watts per candle. Four Columbia and five Edison lamps were entered in this test. All the former were burning after 730 hours; only two of the latter were burning after 600 hours. At 786 hours the Edison lamp developed 9¾ C. P., the Columbia, 12¾, demonstrating that one Columbia lamp is equal to three Edison lamps. Columbias sell at 2[illegible]c. On the basis of their efficiency the Edison lamps should be sold at 6⅜c.

Mr. Wm. H. Pike, Jr., so long connected with the Brady Manufacturing Company of Brooklyn, N. Y., and who has been their superintendent for the last two years, has resigned and is now taking a much-needed rest. He is succeeded by Mr. Oluf Tyberg, M. E., so long and favorably known as a practical and theoretical engineer and as the designer of many labor-saving machines, automatic and otherwise. Mr. Tyberg has acquired an interest in the company.

THE TELEPHONE WORLD.

The Missouri and Kansas Telephone Company has commenced work on it underground system in St. Joseph. Mo.

Baltimore capitalists are projecting an independent exchange system at Bridgeport, Conn. It is presumed that they will acquire the charter rights of the Connecticut Telegraph and Telephone Company, which was chartered in 189 .

The city council of Port Huron, Mich., has rescinded its action demanding the removal of all Bell telephones from the city offices and departments.

The Pennsylvania Telephone Company of Harrisburg, Pa , is preparing to establish an exchange at Mechanicsburg. Pa

The Citizens' Telephone Company, St. Joseph, Mo., has asked for an extension of six months in which to complete its plant.

The New York and Pennsylvania Telephone and Telegraph Company is making extensive improvements in its lines between Buffalo and Erie.

The board of trade of Saginaw, Mich , is behind the movement to organize a local telephone company at that place.

The Southern Bell Telephone Company is making an effort to establish exchanges in Girard and Phœnix City, Ala.

The Citizens' Telephone Company has completed its line between Carbondale and Honesdale, Pa. *Anthracite*, of Carbondale, says: "This branch is but a local branch of the great national telephone system which is spreading slowly over the whole country. From this city the line will probably soon be extended down the entire valley and then be connected with the main system."

The Columbian Standard Telephone Company, to operate in Maryland, District of Columbia, Virginia and West Virginia, has been organized at Washington, D. C., with L. C. Hine. of Washington, president; Gen. Felix Agnus, of Baltimore, vice-president, and George W. Cross, general manager. Its headquarters are in Washington, with branch offices in Baltimore and Richmond.

The Wayne Telephone and Telegraph Company is being organized at Newark, N. Y., with a capital stock of $5,000.

The Chesapeake and Potomac Telephone Company is contemplating the enlargement of the Central Exchange Building, at St. Paul street and Bank Lane, Baltimore, Md.

A. B. Ferdinand, representing the Milwaukee Construction Company, has secured a telephone franchise at Sheboygan, Wi .

The Wisconsin Telephone Company has asked for a franchise at Baraboo, Wis.

F. P. Crocker has been made manager of the Wausau Telephone Company, Wausau, Wis. It is the purpose of the company to operate exclusively in Wausau, and to furnish service to subscribers at actual cost, the company being formed on the co-operative plan.

The New England Telephone and Telegraph Company will erect a new exchange and office building at Worcester, Mass.

The Globe Telephone and Construction Company is being organized at Des Moines, Ia., with a capital stock of $20,000. It will manufacture telephones under the patents of John Serdinko of San Antonio, Texas, and establish exchange plants. C. K. Mead is at the head of the enterprise.

J. H. Fous will establish a telephone exchange at Mt. Vernon Springs, N. C.

The establishment of a telephone exchange at Ashburnham. Mass., is contemplated.

The police signal and the fire alarm wires in Boston are to be placed in one duct of the New England Telephone Company's conduit.

H. M. Brinkerhoff, electrical engineer for the West Side Construction Company of Chicago, known as the Metropolitan Elevated Railway Company, has awarded the contract for furnishing a telephone system to the Western Telephone Construction Company, Chicago. This system contemplates about thirty telephone outfits, one at each railway station.

The Home Standard Telephone Company has been incorporated to operate in Albany and Rensselaer counties. N. Y. The company will construct lines of telephone and telegraph to connect the cities, towns and villages in Albany county and the villages of Bath-on-the-Hudson, East Albany and Greenbush in Rensselaer county. The central office will be in Albany. The capital is $850 000, and the directors are Henry Russell, John H. Farrell, Charles Whitney, William H. Keeler, John M. Bailey, William McM. Speer, James Rooney, Howard Hendrickson, William Barnes, Jr., William N. B. Sanders, William P. Budd, James B. Lyon, William A. Graves, John A. McCarthy and William J. Walker, of Albany.

A telephone company with a capital stock of $100,000 has been organized in Lewisburg, Pa.; the purpose is to extend the lines to every part of Union County, the central station being a Lewisburg. President, J. T. Baker; secretary, C. H. Hassenburg; treasurer, C. Shaffer.

The Phœnix Telephone Company has asked permission to erect poles and wires in Altoona and Hollidaysburg, Pa.

The Long Island telephone service of the New York and New Jersey Telephone Company has been completed to Orient village.

The wires of the Central New York Telephone and Telegraph Company in Utica, N. Y., are soon to be placed underground in the business part of the city. The subway is now under construction.

Pilot Mound and Fraser, two Iowa towns, are being connected by a new telephone line.

The Home Telephone Company, Uniontown, Pa., is ready to make contracts for its exchange and line equipment. Evans Johnson is manager, and can give necessary information to bidders.

An extensive inter-rural telephone service is to be established at Salisbury, Md. Franchises have already been granted to S. E. Gordy, Major Humphries, W. H. Jackson and other gentlemen residing near that place, to connect their farms with the local lines and exchange in Salisbury.

Telephone Improvements at Syracuse.

Plans for the Central New York Telephone and Telegraph Company's new building at Syracuse, N. Y., have been approved. The structure will be of iron, stone and brick, four stories high, fitted throughout with modern electrical appliances. Work will be pushed so that the wires and offices may be transferred to the new building early next spring. The building will cost $35,000.

The metallic circuit of this company connecting Syracuse, Auburn and Skaneatelas has been completed. A force of men is now stringing a new copper circuit between Syracuse and Utica. As soon as that is completed, a new line will be constructed between Lowville and Watertown. Next year the metallic circuit will be extended to Gouverneur, Carthage and Ogdensburg, and on down the river to Clayton, Thousand Island Park, Alexandria Bay and other resorts along the St. Lawrence. At Ogdensburg cable connections will be had with Canada.

The Independent Movement in Iowa.

The independent telephone companies are taking business right away from the Bell Company in Iowa, as shown by the following:

BOONE, IOWA, July 14, 1895.

Publishers ELECTRICITY.

Gentlemen: We have an exchange of 120 subscribers in this city, nearly completed, and have replaced all but about a dozen of the Bell instruments. They had, prior to our beginning business, dwindled down to about fifty subscribers in this town of 10,000 people, which was due to their prohibitive prices and the fact that the care of the local exchange was lost sight of in their attention to the toll lines. They had been operating here some twelve years without a regular franchise. When our construction work began they commenced rebuilding, setting poles down the principal street, whereupon the city council served notice on them to cease work until they could show authority for using the streets. They then applied for a franchise, which has been granted them, but with the following restrictions: that the rental for 'phones in business houses shall not exceed $2.50 per month, residences $1.50 per month; that the toll for five minutes' use of line to points within the county shall not exceed fifteen cents, and to points within a radius of 5) miles twenty cents. Prior to the granting of the franchise they notified the city fathers that they would not accept a franchise that was limited in rate, threatening to pull out of town, etc., etc. It now remains to see what action they will take in the matter.

We are using the equipment of the Western Telephone Construction Company which is giving splendid satisfaction.

Kindly send to our address your paper for one year. We are much pleased with your position on the telephone question, and hope you will continue on the side of "the people." Yours truly,

BOONE COUNTY TELEPHONE COMPANY,
CHAS. E. WELLS, Secretary.

EDITORIAL NOTES.

There are still left in this trade a large number of men who have entered into it for their life work. They may be disheartened, but they have not given up. It is for them that we write. To them we present our argument, and to them we must all look for the re-establishment of business principles, the reinforcement of the doctrines of common sense.

It is for these men to consider just why wrong has temporarily triumphed over right, why it was possible for the tricksters and adventurers to bring the industry to its present condition.

And when these questions receive careful thought the only answer possible is that the electrical press has not done its duty.

If the "Electrical Engineer," the "Electrical World," the "Electrical Review" and the "Western Electrician" had faithfully done their duty by the trade they claim to represent, whose best interests they claim to guard, the present situation would never have confronted us.—"ELECTRICITY," June 5, 1895.

The Double Arc Lamp Decision. Judge Showalter handed down last week an opinion in the case of the Brush Company vs. the Western Electric Company which will be read with interest by a very large circle of the electrical fraternity. Unlike many of the recent important decisions in electrical patent cases, the validity of the militant patent is not questioned, but the effect of the decision will be scarcely less far-reaching than it would be were the Brush patent entirely overthrown. It will be remembered that on September 2, 1879, Mr. Charles F. Brush patented a means by which in an arc lamp two or more sets of carbons could be successively thrown into action so that the succeeding carbon should not burn until the preceding one had been completely consumed. The wording of the patent disclaims any specific device by which this shall be accomplished although describing one device by which it can be accomplished, but distinctly describes the sequence of steps by which the desired result is to be obtained, leaving the mechanical devices entirely open. In brief, Brush's device was this, that where two pairs of carbons were involved and initially the two members in each pair were in contact, in striking the arc one pair were separated slightly before the other pair and therefore maintained by the actuating device at a slightly greater distance apart than the second pair after the arc was struck. By this arrangement, although both of the feeding carbons were actuated by the same controlling mechanism and suspended by clutches dependent upon the same, the carbon which was maintaining the arc might feed for that purpose until consumed without rendering it possible for the succeeding carbon to be thrown into action. According to the reading of Brush's patent, the order in which the various pairs of carbons should be successively thrown into action was predetermined by the mechanism employed and not accidental. This patent further provided for the proper throwing into action of the predetermined pair of carbons when those already in action were consumed, so as to maintain without serious interruption a continuous light until all of the carbons had been successively consumed.

The interpretation of the Brush Company of this patent was that it covered the use of successively burning pairs of carbons whatever the procedure by which the arc was first struck, maintained and afterwards transferred from a consumed pair of carbons to an unconsumed pair. According to this interpretation, two pairs of carbons actuated in any possible way, whether by a common mechanism or separate mechanisms, if combined in a single structure, was an infringement, provided the simple shifting of the arc from the consumed pair to an unconsumed pair occurred at the proper moment to maintain practically unimpaired a continuous illumination during the combined life of the several pairs of carbons. Thus interpreted, the patent was so broad as to practically monopolize the manufacture and use of all-night or long-burning arc lamps, and the Brush Company have so assiduously maintained their views of the case that nearly every manufacturer who has attempted to accomplish the same thing has had either to pay royalty to the Brush Company or stop business. The lower courts have freely granted injunctions without hearing upon the complaint of infringement by the Brush Company, and thus many were deterred from going into the business either by the fear of legal consequences or the expense of immunity purchased in the shape of royalties.

Judge Showalter's opinion, which is given quite at length elsewhere in this issue, places a very much restricted construction on the patent, and while its validity, so far as its verbal claims are concerned, is tacitly maintained, other obvious methods, such as those covered by the Scribner patents, are held to be not infringements. While this trial was not in a court of last resort, Judge Showalter's opinion is so clear and evinces such a comprehensive and acute understanding of the elements involved that it seems scarcely probable that an appeal will be taken.

Entirely aside from the result of this case, which is gratifying to us, it is a pleasure to read the opinion, which, in its lucidity of expression and apparent complete comprehension of all that was involved, stands in such bold contrast to some opinions on electrical patents handed down within the past few years.

The Rowland-Forbes Controversy. Up to last week ELECTRICITY had seen little or nothing in the controversy between Prof. Henry A. Rowland and Prof. George Forbes over the designing work on the Niagara plant worthy of newspaper comment. We looked upon it as an unfortunate episode, and hoped to hear the last of it soon. The charges made by Prof. Forbes in London *Lightning*, and printed in full last week in ELECTRICITY, have changed our views--at least in one particular. We should seriously regret now to have it end where it is, not that any newspaper reply from Prof. Rowland is called for or would be even permissible. Other measures are now demanded.

Prof. Forbes has, however, even if grossly slandering Prof. Rowland, performed a real public service in tearing the mask off the heretofore concealed financial plans of the Niagara promoters. We do not know who originated the expression "brutal frankness" or we would give him credit for it as we apply it, for no other words known to us can so clearly express Prof. Forbes's offence against his company. He is guilty of brutal frankness.

We have to do with only one sentence in Prof. Forbes's letter. Meantime we will go back a few weeks to recount recent events.

On June 12 ELECTRICITY said:

> But after all this babble about franchises and transmission which the *Engineer* indulges in is cleared away, there is another feature of the situation which is also entirely beyond the comprehension of our contemporary—the *stockjobbing* part of the Niagara enterprise, which has already proceeded far enough to be conspicuous to those who give any real thought to the scheme, and which will soon be even more apparent.

The *Engineer*, we believe, characterized this expression of opinion on our part as vulgarity.

On July 3 we reported the remarks of Mr. Rankine of the Niagara Company before the Buffalo Common Council, as follows:

> We are not going to sell or distribute any power ourselves, even to Niagara Falls, but intend to *organize* and CAPITALIZE A COMPANY to conduct our business here, and we want authority to transfer our franchise to them.

This was perhaps a plain enough declaration from the company of its intentions. Now Prof. Forbes comes to our defence (though we did not need any) by saying:

> The officials of the Niagara Company have informed me and others that he (Rowland) was employed only to get him to withdraw his opposition to alternating currents.

Now we would like Prof. Forbes or "the officials of the Niagara Company" to explain, if they can, how the opposition of Prof. Forbes or any other man to alternating currents could hinder the success of the Niagara plant in its legitimate workings? Would this opposition hoodoo the gigantic dynamos, create bugs in the transmission lines, or play hob with the transformers in any mysterious manner? Would it make the line losses greater between Niagara and Buffalo?

We think not. What it might have done, however, would have been to point out the weak spots commercially in this enterprise, and make it more difficult for the original promoters to unload a few millions of securities on the public.

To prevent the expression of opposition of this nature the company were willing, by the confession of their own consulting engineer, to commit bribery.

We are certain of Prof. Rowland's innocence of these serious charges. We do not believe he could be bribed. But that does not change the facts. The Niagara Company would stop at nothing to insure the success of its plans—to sell stocks and bonds on an enterprise which is as sure to be unprofitable as the water is to continue to flow over Niagara when they extend their service to Buffalo or further.

The conviction grows upon us that ELECTRICITY will never need to offer one word of apology for any strictures made upon the Niagara promoters.

Canal Towage. Mr. Frank W. Hawley has gone abroad to raise money for equipping four miles of the Erie Canal for electric towage. The plan now is to run a motor carriage in the air on a 1½ inch cable for towing purposes—a scheme which would be picturesque even if unpractical. We wonder what advantages Mr. Hawley can show to proposed investors in running his machine in the air over running it upon the well-graded and level towpath on a track. There would be about as much sense in towing our Broadway surface cars from a balloon as there is in hauling a canal boat from mid-air.

What the Erie Canal needs first is more water—more width and greater depth. Then the question of towage can be easily settled. A track on the towpath with ordinary electric motors would be a certain success. Unless Mr. Hawley puts up his own money, and we guess he hasn't got much, his method will probably hang just where it is now—in mid-air.

Under the Searchlight.

Views and Opinions on Timely Topics.

MR. J. HOBART HERRICK, formerly vice-president and commissary of the Edison General Electric Company, says that G. E. stock is a good buy and will soon sell at 50. But we do not believe Mr. Herrick is putting his own money into it.

* * *

THE receivership of the Royal Arc Electric Company, which Mr. Louis Howard organized to do business "through the universe," has been closed. The receiver, Foster M. Voorhees, gets $200.

* * *

THE receiver of the Schuyler Electric Manufacturing Company, of Hartford and Middletown, Conn., has been ordered to sell the plant as the claims against the company are so complicated that there is no other means of effecting a settlement. We shall throw a little light on this subject sooner or later, proving again that ELECTRICITY has a way, not open to the courts, of getting at the facts. This Middletown deal was one of Mr. Coffin's earlier attempts at "consolidation" and was not carried out with his accustomed cunning. It savors more of the burly highwayman with a club than of the confidence man who afterwards learned how to induce people to give up their money cheerfully.

* * *

Dr. Adams's Troubles.

Stockholders in the Air Line Protest.

St. Louis stockholders in the Chicago-St. Louis Electric Road are organizing to recover their money if possible, and will bring suit if any way is found to prove fraud.

Dr. Adams says he first made a contract with a former third vice-president of the General Electric Company to sell $8,000,000 of bonds, but the latter failed to do so. Then a Chicago firm agreed to place $9,500,000. They also were unable to carry out their contract. All told, the company has received $112,000, which has been spent, several hundreds of it in advertising in our esteemed contemporaries. Dr. Adams says that the misfortunes of his enterprise are largely due to the fact that General Electric stock has fallen from 119⅞ to about 30, which is as good a reason as any we can expect from him.

* * *

THE decision of Judge Showalter in the double-carbon arc lamp patent removes effectually the only remaining grip which the General Electric Company has had upon any branch of the electrical manufacturing business. It was the only patent they had upon which a royalty was collected, nearly every manufacturer of double-carbon lamps, including the Fort Wayne Company, having paid $5 per lamp. When the Load Line is redrawn next year, the Brush Patent will be added to the record—Feeder and Main Patent, Edison Lamp Patent, Thomson Regulator Patent, Brush Double-Carbon Lamp Patent—all now gone. What is there left for a foundation for the General Electric's Patent asset item of over $[illegible],000,000?

* * *

British Obtuseness or American Puffery.

(London Electrical Review, May 31.)

An "interesting" type of battery is (says the American *Electrical Review*) made by the Multivolt Battery Company of Brooklyn. In brief, this battery consists of a number of independent cells, the containing vessels of which have holes in them, and which are all immersed in a single vessel containing an excited fluid; in other words, there are a series of leaky cells, each on partial short-circuit, and the electromotive force of the combination is that of the cells in series diminished by the partial short-circuiting. The result of this wonderful and "interesting" arrangement is, that a 6-cell battery, which should have given normally 12 volts, actually gave only 5, at which the *Electrical Review* expresses astonishment. Truly, our American friends have something yet to learn in elementary electricity.

(London Electrical Review, June 14.)

The *Western Electrician* believes that we underrate the intelligence of our readers even if they are English, and speaks of enlightening British obtuseness. No one, however, can accuse us of overrating the scientific qualifications of certain of our American contemporaries. We need only refer to the Boynton "multivolt" battery, to a note on page 685 of our issue of May 31, and to page 424 of the New York *Electrical Engineer* for May 29.

(London Electrical Review, June 28.)

The Boynton "semi short-circuited" battery (to which we alluded in a recent issue), devised by our ingenious American friends, is being run the gamut of the American electrical papers, and is being described in the most approved "circular" style. Do the editors wilfully blind their eyes to the absurdity of the arrangement, or are they grossly ignorant of elementary electrical facts?

We guess our British friends have the laugh on our American contemporaries this time.

* * *

UP to a few weeks ago the trolley systems in Brooklyn ran at speeds giving the greatest satisfaction to the majority of people in the city. Owing to the niggardly policy of the railway companies in hiring cheap men to run the cars, accidents were too frequent. Then mass-meetings, composed chiefly of the residents of the Heights section who rarely ride in the cars, were held to protest against the high speeds, which were reduced to an extremely slow rate. Now the prominent real estate men have joined in a petition to the Board of Aldermen urging a modification of the ordinance restricting the speed of trolley cars to six and eight miles an hour. They contend that the reduced speed is detrimental to business interests and the development of the outlying districts of the city, and their views are absolutely correct.

* * *

IT IS reported that a movement is on foot among those employees of the G. E. Company who receive the highest salaries providing for the offer by each of a month's salary to the company if the works shall be moved to some other place. The joys of life in Schenectady are evidently not appreciated by the G. E. boys. And no wonder.

* * *

WE were in error in stating that the *Electrical Review* printed the advertisement of Dr. Adams's air-line scheme, and we cheerfully offer apology to our esteemed contemporary, which has sins enough to bear without being unjustly accused.

* * *

But They Are Being Learned Rapidly.

(From Rochester Democrat and Chronicle.)

There are a good many things yet to be learned about the effects of ELECTRICITY.

GENERAL ELECTRIC'S FINANCING POLICY.

Northwest General Electric—The Scheme, the Companies Financed, the Facts and Figures from the Official Record.

HOW BONDS ARE MANUFACTURED FOR NEW ENGLAND INVESTORS.

CHAPTER III.

The St. Cloud City Street Car Company.

INTRODUCTORY.

In taking up for consideration the affairs of the St. Cloud City Street Car Company, and the relations which that enterprise bore to the great scheme of electrical financing which this series of articles is designed to elucidate, it is proper to revert to the story of the operations at Winona published in our last two issues.

When the Thomson-Houston financiers decided to begin operations at Winona, that town had an unprofitable horse railway, capitalized at $25,000. There were 18,200 people in the town. The first financing move was to buy the horse railway, equip it electrically, and capitalize it at $200,000. There were four miles of track and no power house. There was also a lighting plant in the town. After a year or more this was bought for $35,000, the two companies put together under the name of the Winona General Electric Company, and capitalized at $900,000.

The trade at St. Cloud City, which we will now consider, differed in some respects from that at Winona. The town had only 7,686 people. The railway company only was bought, as the scheme did not hold out long enough to permit of buying the lighting company and making another of Mr. Coffin's grand consolidations. There was thus only one capitalization. The operation was not therefore, a large one, but it is even more instructive than the one at Winona, in that it shows effectually that the probable or possible success of a local enterprise did not enter at all into the calculations of these Thomson-Houston financiers. That was a subject in which they had no interest, and to which they gave no thought.

For suppose a small system did have the possibilities of moderate success, and was able to earn, say $2,000 a year net, it would then have been a little more difficult to buy it, and it would have taken fifty years to make $100,000 out of it legitimately. Moreover, for purposes of bonding and realizing money quickly a paying plant was little if any better in the hands of Mr. Coffin than any other plant.

The Thomson-Houston scheme was worth fifty honest deals—could not $100,000 be realized in fifty days? All that was needed was to find a railway whose owners had lost so much money that they were willing to sell it cheap, equip it electrically, bond it for five or ten times its value and sell the bonds; and Mr. Coffin knew how to sell them. What was earning capacity to him or his associates? Easy purchases and plenty of bonds was their watchword. If the bonds were worthless, what of that? Any one could sell good bonds. But to build up a reputation as a Napoleon of finance it was necessary to sell something which no one else could sell. This Mr. Coffin did, and the reputation is his.

We shall show, we think, that there never existed a shadow of chance for the St. Cloud Street Car Company even to pay interest on its bonds, unless the electric railway was to be a human incubator and quadruple the population of the town in one season.

THE SCHEME.

When those eminent financiers, Messrs. E. R. Gilman and C. A. Coffin (president of the G. E. Co.), first discovered the splendid possibilities waiting for their master minds for full development in the village of St. Cloud City the town had a population of 7,686 people. It had had for several years a horse railway with 4 miles of track, and the cheapest possible equipment. It had lost money every month of its existence, and had a nominal capital of $100,000. The owners were easily induced to part with this property for $16,000, not in cash, but in bonds of the new enterprise which were to be (and were) issued. Then the usual plan of financing was followed. The change to electric power was made with the strictest regard to the customary plan in these schemes, i.e., giving the road as little value in the way of equipment as possible. One type D, T.-H. generator was provided, pole line construction was completed, and power was rented from the local lighting company, there being no power house provided. There was also in this case an extension of the system to the thriving city of Sauk Rapids, 3 miles away, which had a population of 1,185 souls, mostly lumbermen, the chief industry being a sawmill. The value of the horse railway as an earning property is perhaps made clear enough from the fact that during the change of equipment, taking several months, no cars whatever were run.

When the Sauk Rapids extension was completed, it was found that the engineering talent in charge of the enterprise had failed to take into account the perturbing fact of rottenness in the wooden bridge over the Mississippi connecting St Cloud City, Stearns County (pop. 7,686), and Benton County, where Sauk Rapids (pop. 1,185) was located, which was totally unfit for carrying the weight of electric cars. Thus during the life of this enterprise the host of passengers between these two points have been compelled to change cars, walking over the bridge, which is 600 feet long, a circumstance which was not likely to and which has not "induced" much travel.

Water power was used by the lighting company and leased to the railway company at 2½ cents per car mile. Mr. C. S. Benson, one of the largest stockholders in the lighting company, was made superintendent, and as every car mile more meant added revenue to his own company, we suppose that the citizens had at least enough cars to ride on.

We think the question of population and general conditions have been made clear. And it was with these conditions, fully understood both by the managers of the Northwest Thomson-Houston (General Electric) Company and by the managers of the parent Thomson-Houston Electric Company at Boston, which latter company did the financing, that $100,000 of stock and $125,000 of bonds were issued upon the St. Cloud City Street Car Company.

With 6.72 miles of track the capitalization of $225,000 was at the rate of $33,500 per mile—just about double what it should have been even if a brick or stone power house had been provided, with first-class construction in every detail. But it must be remembered *no power house was built.*

CONDITION OF THE PROPERTY.

Let us now consider the actual physical condition of the property after it came into the possession of the Northwest Thomson-Houston (General Electric) Company, electrically "equipped," and the capitalization raised to $225,000. We submit a copy of the trial balance of the company, taken directly from their records:

[COPY.]

ST. CLOUD CITY STREET CAR COMPANY.

TRIAL BALANCE FOR TEN MONTHS ENDING APRIL 30, 1893.

Electrical railway plant	$204,540.00	
Franchise	20,460.00	
Northwest General Electric Co	7,204.36	
Track equipment	3,469.92	
Car equipment	3,092.65	
Snow plows	2,088.97	
Buildings	496.77	
Overhead construction	439.30	
Cash	314.50	
Organization expense	151.50	
Benson, C. S	99.30	
Tools	71.42	
Transportation	4,840.68	
Motive power	3,896.93	
Maintenance of cars and motors	2,946.09	
Maintenance of way	799.61	
Office and superintendence	764.39	
Insurance	329.50	
Taxes	309.86	
General expense	138.46	
Interest on notes	795.00	
Interest on bonds	1,072.42	
		$258,321.71

Credits.

Capital stock	$100,000.00	
Bonds	125,000.00	
Notes payable	21,182.82	
Earnings	11,788.89	
Advertising	50.00	
		$258,321.71

It will be remembered that in the official trial balance of the Winona Company when bonds were issued the property account was placed at $193,803.80, notwithstanding that their own inventory made it $83,9[illegible]2.22, which latter sum was at least $30,000 too high. In the St. Cloud deal the overvaluation was even more flagrant.

Electric railway plant is given at $204,540.

The company had been given as a bonus some wild land both at Sauk Rapids and St. Cloud which was of slight value. It had a wooden car shed in St. Cloud worth perhaps $500, and a slab shed at Sauk Rapids costing $150 to $200. There were 6.72 miles of track, with 40-pound T rails, one generator and ten cars, one of which was second-hand. The above mentioned items cover nearly everything of any value in the inventory. Summarizing, we find the total value of the tangible property of the company about as follows:

Property.	Value.
7 miles single track, with overhead construction @ $7,000 per mile	$49,000
10 motor cars	25,000
Type D T.-H. generator, 62 K. W.	2,250
Car sheds	700
Unimproved real estate	500
Miscellaneous	5,000
	$82,450

as against the $204,540 claimed, an inflation of $ 22,090, or over 100 per cent. in the property account.

In the statement given by this company to the *Street Railway Journal* the track mileage is given at 13.2—10 for St. Cloud proper and 3.2 for the Sauk Rapids branch. Mr. Byllesby's young men must have measured both rails in making up these figures, as the actual mileage is for St. Cloud 4.04 and for the Sauk Rapids branch 2.68, or a total of 6.72.

The franchise is valued at $20,460. Just what this was worth will be made clear later in examining the earning capacity of the road.

The franchise need not be taken into account at all in arriving at the real condition of the property, which is shown by the following:

CONDENSED BALANCE SHEET, ST. CLOUD CITY STREET CAR COMPANY APRIL 30, 1893.

Liabilities:		
Capital stock	$100,000.00	
Bonds	125,000.00	
Notes	21,482.82	
		$246,482.82
Assets:		
Real estate, franchise and plant		$82,450.00
Deficit		**$146,032.82**

It is, however, apparent that the "Trial Balances" of all these enterprises meant little more than that the officials delegated to make them up had a severe trial to make them balance at all. The balance was only brought about by making an arbitrary valuation of the property and franchise accounts as large as was necessary to accomplish the object in view.

EARNING CAPACITY.

But while the property of any company may be too small apparently to justify its capitalization, it sometimes happens that the earning capacity is so great as to fully justify it. Was this the case at St. Cloud City? In answer we print the official statement of earnings, expenses and interest for a period after the capitalization of $225,000 had been placed upon the property.

[COPY.]

ST. CLOUD CITY STREET CAR COMPANY.

STATEMENT OF EARNINGS AND EXPENSES FOR TEN MONTHS ENDING APRIL 30, 1893.

Earnings.		
Earnings from fares collected	$11,788.89	
Earnings from advertising	50.00	
		$11,838.89
Expenses.		
Transportation	$4,840.8	
Motive power	3,896.98	
Maintenance of cars and motors	2,946.09	
Maintenance of way	789.64	
Office and superintendence	764.9	
Insurance	3.9.50	
General expense	188.46	
Taxes	3 8,8	
		$14,025.60
Deficit (for 10 months)		**$2,186.71**
Interest.		
Interest on bonds	$1,072.2	
Interest on notes	795.00	
		$1,867.42

It will at once be noted that there was a deficit according to the official report then made in actual operations for ten months of $2 186.71, and of $1,867.42 additional for interest *paid* on bonds and notes. Clearly the *earning capacity* of this road did not present any offset for the deficit in assets as against capital liabilities, and it is equally clear that there is nothing unfair in leaving out of consideration altogether the franchise, which was valued in the preceding official statement at $20,460. The franchise of a railroad company earning only $11,838.89 gross in ten months and losing $2,186.71 in operation alone can scarcely be said to have any value.

Moreover, the official statement of earnings, etc., as above is not at all a correct showing. The actual situation, taking into account the essential items omitted in preparing the above statement was as follows:

PROFIT AND LOSS ACCOUNT ST. CLOUD CITY STREET CAR COMPANY APRIL 30, 1893.

	10 mos.	Yearly rate	
Earnings	$11,838.89	$14,206.56	
Expenses	14,025.60	16,830.2	
Loss from operation	**$2,186.71**		**$2,624.16**
Fixed charges:			
Interest on bonds, $125,000 @ 6 per cent		$7 500.00	
Interest on notes, $21,482 82 @ 10 per cent		2,148.28	
Loss			**$9,648.28**
Add:			
6 per cent. depreciation on inventory of $204,540			$12,272.40
Dividends on $100,000 stock at 6 per cent			6,000 00
Total deficit in operation			**$30,564.84**

NOTE.—The official statements of the St. Cloud City enterprise with which we have at hand are all made up for the ten months ending April 30, 1893. For the sake of a clearer understanding of the figures, we carry them out at the proportionate rate for the full year.

The company could scarcely have been kept afloat for the 30 days during which the bonds were being issued except by giving its notes to the Northwest Thomson-Houston Company for money advanced. These notes were then discounted at the St. Paul and Minneapolis banks by the Northwest Company, and renewed over and over again as they became due.

The computation of 10 per cent. annual interest on notes may seem to our Eastern readers as being entirely too high a rate. Quite the contrary is true, however. The rates paid by the Northwest Thomson-Houston (General Electric) Company were rarely less than this, and often ran as high as 20 per cent., proof of which we shall soon present. In fact, these high rates of interest are quite common in that section, even in legitimate lines of business, *cash* being scarce, and nearly the entire business community being borrowers. When the rates paid for discount by the Thomson-Houston people were abnormally high, the paper was usually handled by *insiders*, thus preventing the fact of the company's pressing need of money from reaching the banks.

WHAT THE ROAD SHOULD HAVE EARNED TO MEET ITS OPERATING EXPENSES AND FIXED CHARGES.

In order to leave no loophole for the escape of the people who engineered this deal, by which it was hoped to sell $225,000 of worthless securities to Eastern investors, and to swell the paper profits of the General Electric Company, we will consider the official statements of the St. Cloud City Street Car Company in the light of well-established laws as to per capita capitalization and percentage of earnings to fixed charges.

It is and always has been well known that a railway company cannot succeed at all in a community of less than 1 ,000 people. Mr. E. E. Higgins, whom we have often quoted, says the securities of no railway in a town of less than 25,000 people are worth the consideration of other than local investors who can watch their own property closely. In towns of 25,000 to 35,000 people he finds, from the records of all the roads in that class, that a capitalization of $12.50 per capita is the maximum permissible. This St. Cloud road should, of course never have been built at all, hence neither Mr. Higgins's figures nor any other figures can be used in estimating what the road and its financing ought to have been. They ought never to have been heard of, and would not have been heard of if their existence had been dependent upon the personal investments of the men who planned the trade, and who relied on shifting the burden upon the ignorant purchasers of the securities.

Probably the one law of street railways best established is this, that the operating expenses must be about 75 per cent. of gross earnings, leaving 25 per cent. for interest on bonds, floating debt, depreciation, and dividends, if any. Applying this law to the St. Cloud property as we did to the Winona enterprise, we have the following result:

The yearly fixed charges were:	
Interest on bonds	$7,500.00
Interest on notes @ 10 per cent	2 148.28
Allowance for depreciation should have been 6 per cent. on $204,540	12,272.40
Dividends on $100,000 stock at 6 per cent	6,000.00
	$27,920.68
which is 25 per cent. of what the road to be a sound property needed to earn per annum, or	$111,682.72
Actual earnings were (yearly rate)	$14 206.56
or about one-eighth of what they must have been to justify the capitalization of $225,000.	
Deduct from $27,920.68, as above, the $6,000 item for stock dividends, which it may be argued did not need to be paid, and we have	$21,920.68
which is 25 per cent. of what the road needed to earn in order to exist at all, or	$87,682.72
about eight times the gross receipts of the road after it had been electrically equipped, managed by supposed experts and capitalized for $225,000.	

CONCLUSIONS.

We think our original proposition, that "the probable or possible success of a local enterprise did not enter into the calculations of these Thomson-Houston financiers," is fully proved. A comparison of the scheme at St. Cloud with that at Winona shows that the more hopeless the prospect of success the more the capitalization was piled on. At Winona (pop. 18,200) the electric railway system alone was capitalized at $200,000, whereas at St. Cloud and Sauk Rapids (combined pop 8,868) it was capitalized at $225,000. This difference was possibly due to the fact that St. Cloud was further from civilization, and that the actual value of the property was less easily determined by Eastern investors.

We have been unable to learn just where the securities of this grand enterprise have been negotiated. That they have been negotiated is apparent, for in the recent list of General Electric assets there appears only a small portion of them, "Bonds St. Cloud City Street Car Company, $5,000." None of them appear to have been turned over to the United Electric Securities Company, the Electrical Corporation or the Street Railway and Illuminating Properties. Hence we infer that they are up as gilt-edged collateral with some of Mr. Coffin's banking friends for a loan either to Northwest General Electric or General Electric.

The officers of the St. Cloud Company are: President, H. M. Byllesby; vice-president, C. K. Stearns; secretary and treasurer, George C. McKnight; superintendent, C. S. Benson. Of these gentlemen, Mr. Byllesby was the manager of the defunct Northwest General Electric Company, which failed to make a success of its remarkable plan of financing, and Mr. McKnight was chief bookkeeper for the same concern.

Two of the ten cars given in the last report of the company seem to have fallen to pieces, or perhaps they are still up as collateral in the hands of the authorities, as on May 31 last, according to our reports, the cars of this company were levied on by the sheriff for personal taxes. At any rate, the Mayor of St. Cloud City wired us as follows on July 25: "The St. Cloud City Street Car Company has eight cars; service excellent."

Probably the Mayor is a good pedestrian, and does not mind walking across the 600-foot bridge, or possibly his official duties never take him to the terminus of the St. Cloud City (pop. 7,683) Street Car system—Sauk Rapids, Benton County (pop. 1,185).

Those who follow us through this series of articles must not lose sight of their ultimate object. It is to prove that the very scheme of financiering which has become so conspicuous through the sensational career of the Northwest Thomson-Houston (General Electric) Company is not different in any particular from that followed by the Thomson-Houston Electric Company of Boston, and that Mr. Coffin's chief reason for desiring a consolidation of his company with the Edison Company was that the game had been played almost to its limit in Boston and with exclusively Thomson-Houston local properties. The consolidation of the two parent companies—Thomson-Houston and Edison—gave Mr. Coffin such opportunities as he had scarcely dreamed of in the earlier days for amalgamating innumerable local companies, either paying ones or otherwise, changing the name to the —— General Electric Company, doubling the stock and tripling the bonded debt. And the scheme was worked at such a rapid rate after the formation of the General Electric Company that the $10,000,000 cash raised from the bond issue disappeared as if it had melted, the treasury became filled with worthless securities, the company came within 24 hours of confessing bankruptcy, and the fallacies of the scheme were made known to the world.

ELECTRICITY has almost proved, we think, that the results were no accident, but the inevitable end of a preconceived plan for swindling the public.

The Last Vestige of Monopoly Gone.

WESTERN ELECTRIC CO. WINS IN THE DOUBLE CARBON ARC LAMP CASE.

Double Carbon Lamps May Now Be Made by Anyone.

In the suit of the Brush (General Electric) Electric Company vs. the Western Electric Company, for infringement of the Brush double-carbon lamp patent, Judge Showalter, in the United States Circuit Court at Chicago, on July 24, decided that there is no infringement in the Western Electric's double-carbon lamp, and put an entirely different construction upon the Brush patent from that of Judge Brown and Judge Gresham in previous cases:

THE DECISION.

In each of these causes [The Brush Electric Company vs. the Western Electric Company, in equity, Nos. 21,545 and .2,211, U. S. Circuit Court Northern District of Illinois] the ground of action is an alleged infringement of patent 219,208 for an electric lamp or light regulator, issued September 2, 1879, to Charles F. Brush, said patent being the property of complainant company.

It is claimed that electric lamps made by defendant company pursuant to patents 416,758, 502,585 and 502,586, issued to Charles E. Scribner and assigned by him to defendant, infringe the said Brush patent.

There are seven claims in the said Brush patent. On the contention of complainant an infringement of each of these, numbered from one to six, is shown in each of the present causes. But this contention rests upon a construction of the Brush patent, extending in common to each of said claims, which is earnestly disputed by the defendant. The controversy, so far as it involves in common each of the six claims as contested in each suit, hinges upon this one point of construction.

If two parallel pairs of carbon pencils with the points of each pair touching are placed in an electrical circuit so that in case either pair were removed the current would still pass through the other such current will divide between the pairs. If such pairs be now separated at once and by a common and uniform movement, the arc will appear between the points of but one pair. It is not practicable to make the points of the carbons impinge so that the resistances through each pair shall be mathematically equal, nor is it practicable to separate the points so that the parting on one side shall be identical in time with that on the other. The reason why the arc forms between one pair only may be said to be that the other pair in fact parts first, thus throwing the entire current through the pair between which the arc forms.

While the partings may be in appearance simultaneous they are not so in reality, or, if we say the partings are in fact simultaneous then the resistance, being accidentally greater on one side, determines the formation of the arc on the other.

On May 7, 1878, complainant's assignor, Brush, patented a contrivance for feeding one carbon pencil toward the other so as to preserve a practically uniform distance or length of arc between the burning points till the carbons should be consumed.

On September 2, 1879, Brush secured, as before stated, the patent in suit. To his invention as above described he added a second pair of carbons, a second pair of carbon holders and a second movable or feeding carbon rod. Each carbon rod passed down through its ring clamp, marked the one C and the other C' in the new patent. The lifter, marked D in the new patent, was triangular in form with a stirrup at the top in which was fastened a lever which was to be operated by magnetic attraction. At each lower corner of said lifter D was an opening formed by two short projections, one above the other, each opening enclosing the edge of its appropriate ring clamp C or C'. The lower arm or section of one of these openings was below the plane of the corresponding part of the opposite opening, so that, when the current passed through the carbons, as the lifter D was pulled up it first engaged the ring clamp of the added carbon rod separating the added pair of carbons, and after an interval of continuous movement the ring clamp of the other carbon rod was engaged by the other corner of said lifter D. The two rods continued thence to move together until the lifter D stopped, and the arc was formed between the carbons which were last separated. The latter pair of carbons being fed together and continuing to burn until consumed, the added pair of carbons then part and form the arc and continue to burn until consumed, in manner as stated in said first patent to Brush. After the first pair of carbons have been consumed and have ceased to burn, the lamp in parting and burning the remaining pair is substantially identical with the invention described in said prior patent.

The ideas of the Brush invention in suit were apparently these:

(1) By separating the added pair of carbons first he threw the entire current down the other pair, and thus determined that the arc should form between said other pair, or pair last separated.

(2) By separating the added pair at a greater distance apart than the other pair he avoided accidental alternation in the arc between the two pairs.

(3) By permanently holding the added pair in such separated relation the first pair could be fed together and consumed without stop.

In his specification, Brush says:

"My invention comprehends broadly any lamp or light regulator where more than one set of carbons are employed, wherein—say in a lamp having two sets of carbons—one set of carbons will separate the other."

Again: "The operation of my device as thus far specified is as follows: When the current is not passing through the lamp the positive and negative carbons of each set A. A' are in actual contact. When, now, a current is passed through the lamp the magnetic attraction of the helices E will operate to raise the lifter D. This lifter, operating upon the clamps C and C', tilts them and causes them to clamp and lift the carbon holders B, B', and thus separate the carbons and produce the voltaic arc light, but it will be especially noticed that the lifting and separation of these carbons is not simultaneous. One pair is separated before the other, it matters not how little nor how short a time before. This separation breaks the circuit at that point, and the entire current is now passing through the unseparated pair of carbons A', and now when the lifter, continuing to rise, separates these points, the voltaic arc will be established between them and the light thus produced."

As already stated, after the first pair of carbons has been consumed so that the first carbon rod holding the stump of the burned carbon ceases to feed and the added pair of carbons thereupon part and burn, the lamp of the new patent, the special feature of the new invention being now superfluous, is substantially identical with the lamp of said first patent.

In the new patent—that in suit—Brush does not, in the specifications, describe, or in the claims refer to, the manner of burning the added pair as being a part of his new invention.

During the burning of the added pair the lamp has become substantially the invention protected by the said first patent.

The patentee says further, in the specification of the patent in suit:

"The lifter D, in the present instance, is so formed that when it is raised it shall not operate upon the clamps C, C' simultaneously, but shall lift first one and then the other (preferably the clamp C first and C' second, for reasons which will hereafter appear). This function of dissimultaneous action upon the carbons or their holders, whereby one set of carbons shall be separated in advance of the other, constitutes the principal and most important feature of my present invention."

The claims in controversy are as follows:

"1. In an electric lamp two or more pairs or sets of carbons, in combination with mechanism constructed to separate said pairs dissimultaneously or successively, substantially as and for the purpose specified.

"2 In an electric lamp two or more pairs or sets of carbons, in combination with mechanism constructed to separate said pairs dissimultaneously or successively, and establish the electric light between the members of but one pair (to wit, the pair last separated), while the members of the remaining pair or pairs are maintained in a separate relation, substantially as shown.

"3. In an electric lamp having more than one pair or set of carbons, the combination with said carbon sets or pairs of mechanism constructed to impart to them independent and dissimultaneous separating and feeding movements, whereby the electric light will be established between the members of but one of said pairs or sets at a time, while the members of the remaining pair or pairs are maintained in a separate relation, substantially as shown.

"4. In a single electric lamp, two or more pairs or sets of carbons, all placed in circuit, so that when their members are in contact the current may pass freely through all said pairs alike, in combination with mechanism constructed to separate said pairs dissimultaneously or successively, substantially as and for the purpose shown.

"5. In an electric lamp wherein more than one set or pair of carbons are employed, the lifter D or its equivalent, moved by any suitable means, and constructed to act upon said carbons or carbon-holders dissimultaneously or successively, substantially as and for the purpose shown.

"6. In an electric lamp wherein more than one pair or set of carbons are employed a clamp C, or its equivalent, for each said pair or set, said clamps C adapted to grasp and move said carbons or carbon-holders dissimultaneously or successively, substantially as and for the purpose shown."

The patentee said further in his specification:

"I do not in any degree limit myself to any specific method or mechanism for lifting, moving, or separating the carbon points or their holders, so long as the peculiar functions and results hereinafter to be specified shall be accomplished."

The specification and claims were evidently prepared with the idea that *the mode of movement*, to wit, the rapid, successive and continuous separation between the pairs of carbons terminating in the arc between the pair last separated could be secured to Brush regardless of the mechanism by which this mode of movement should be produced. In Brush Electric Company vs. The Fort Wayne Electric Light Company, Judge Gresham held, answering the contention that the first, second, third and fourth claims were for functions or results and hence void, that mechanism such as described in the drawings and specifications, or a substantial equivalent, was an essential element in each of said claims. I am not called on to determine these constructions, but the conclusion reached apparently in the Toledo case, that no one of these claims contains the element of dissimultaneous or successive separations between the members of each pair of carbons for the purpose of forming the arc between the pair last separated, seems to me unsound.

The patentee says:

"In the lamp as shown in the drawings the support K is in the form of a tube surrounding the carbon holder B and this support K is made of such a length that when the carbons A' shall have been sufficiently consumed a head upon the carbon-holder B will rest upon the top of the support K, whereby the weight of the carbon-holder B and its support K shall at all times and under any circumstances be supported by the lifter D."

In other words, and without going again over the mechanism, the lamp is constructed so that the carbons A shall first burn. By reason of the support K being carried on the upper carbon-holder of the first pair of carbons to burn, and of the greater distance between the two carbons of the added pair, said added pair could not be burned first.

It is, in other words, the characteristic feature of this lamp, the very purpose signified by its construction, that the position of the first arc shall be determined before lighting as between the two pairs of carbons.

Yet in the opinion in the Toledo case this is declared to be "a wholly immaterial and useless feature."

Even if it were, in fact, immaterial which pair of carbons burned first—supposing it to be true that if the carbons were separated simultaneously instead of dissimultaneously the lamp would still operate—the fact remains that the patentee took from the Government claims in which the dissimultaneous separations are the special feature. Moreover, the feature of dissimultaneous arc-forming separations—referring here to the interval of hours between the arc forming separation of the first pair to burn and the arc-forming separation between the added pair—is not in any one of the claims. In order to make out a case of infringement, the former element must be gotten out of and the latter must be gotten into each claim. This in my judgment cannot be done. The lamps made under patent 418,758 do not contain mechanism constructed to cause the dissimultaneous initial separations of the carbons, nor do the lamps made under patent 502,585, nor do the lamps made under patent 502,586. I hold, therefore, that no infringement is made out in either suit. The order will be in each case that the bill be dismissed for want of equity.

PREVIOUS LITIGATION ON THE BRUSH PATENT.

The first suit brought upon the Brush double-carbon lamp patent 219,208 was that against the Fort Wayne Jenney Company upon the Cain lamp, which was then manufactured by the Fort Wayne Company. This suit was decided in the latter part of 1889, and was begun, we believe, in 1886 or early in 1887. A decision in favor of the complainant was rendered by Judge Gresham at Indianapolis, the only defence in this case being the invalidity of the patent. Infringement was practically admitted. Suit was also brought against a user of the Indianapolis Jenney Electric Light Company's double carbon lamp, which also was practically admitted an infringement, and of course a decision was reached in favor of the complainant

In 1887 suit was begun against the Western Electric Light Company of Toledo, Ohio, which used the Scribner lamp, manufactured by the Western Electric Company under patent 418,758. Here an entirely new question was brought up, but the court failed to understand the matter correctly and a decision was reached finding the defendant's lamp to infringe. This was in August, 1890. Prior to that time suit had been begun in the Northern District of Illinois against the Western Electric Company, and upon the finding of the court in the suit at Toledo, Judge Gresham granted a preliminary injunction upon this same Scribner lamp which had been found to infringe in the Toledo case.

In getting the Brush double-carbon lamp patent sustained, the Brush Company's counsel and experts had limited the claims to a single lamp controlling two sets of carbons. After the decision in the Toledo case, and after Judge Gresham had granted a preliminary injunction in the suit against the Western Electric Company, at Chicago, the Western Electric Company began the manufacture of double lamps, that is, lamps which, instead of being single, each controlling two sets of carbons, were two separate lamps enclosed in one case, each separate lamp controlling one set of carbons. The Brush Electric Company attempted to get a snap judgment of infringement against these devices by making a motion for attachment for contempt of court. This motion was made and argued before Judges Gresham and Blodgett in February, 1891, and marked the turning point in the career of the Brush double-carbon lamp patent in the attack of the Brush Company on the Western Electric Company. After this motion for attachment for contempt of court had been dismissed, a new bill was filed by the Brush Electric Company against the Western Electric Company upon the two forms of lamp above described, in which each set of carbons was controlled by a separate electro-magnetic mechanism, and the proofs in the two cases, the one involving the original lamp which had been adjudged to infringe at Toledo and the other involving the so-called twin lamp above described, have been proceeding for the four or five years since that time. The two cases were finally brought to hearing the first of last May, and resulted in the decision of Judge Showalter limiting the Brush patent and finding that neither the original Scribner lamp involved in the Toledo case nor the twin lamp involved in the subsequent suit infringed the Brush patent.

For the purpose, apparently, of intimidating intending purchasers and harassing a competitor, the Brush Electric Company has filed bills against a large number of users of double-carbon lamps, in which cases no steps have been taken by complainant at all. There are some fifteen or more of these cases, some of them against municipalities in various parts of the country. Of course, in view of the decision of Judge Showalter, nothing further will be done with these suits.

Litigation against some other manufacturers of double-carbon lamps has been proceeded with in other circuits, and in some instances settlements have been made, the defendants being influenced thereto by the opinions of the courts in the various cases which had been contested.

Photographs of Lightning.

We have from time to time published interesting photographs of lightning flashes. The officials of the Weather Bureau are now making photographic experiments which they hope will prove valuable, not only to science, but also from a practical point of view as giving an idea of the necessary protection for houses in the city and country. Alexander McAdie has been engaged in investigating thunder and lightning since 1882. He has made a large number of interesting photographs of lightning, and this summer proposes to carry out an idea which was original with him. He hopes, with the aid of three cameras stationed at different points, to ascertain the actual dimensions and power of lightning flashes. The tip of the Washington monument has been selected as the point on which Mr. McAdie's three cameras are sighted. It is the most exposed object in the District of Columbia, the play of lightning around the tip being very frequent. One of Mr. McAdie's cameras is on the roof of the Weather Bureau, another in one of the committee rooms of the Capitol and a third is at a station back of Fort Myer, across the Potomac River. The distance from the three stations to the monument is accurately known, and Mr. McAdie's object is to get photographs from the three stations simultaneously of flashes of lightning around the Washington monument.

With the three cameras, the flash which is foreshortened from the Weather Bureau station will be visible in its entire length from the station at Fort Myer, or at the Capitol committee room. If Mr. McAdie should succeed in getting a photograph of a lightning flash from the three stations, the bolt itself will be afterward remodelled and set up at the Weather Bureau. Computations as to that particular bolt can be made with considerable accuracy and the bolt would be valuable for comparison

Mr. McAdie has also devised an interesting apparatus for measuring the duration of the flash. Inside of a camera there is a small tin plate with fasteners to receive a sensitized plate. This plate is made to revolve very rapidly. When the flash is photographed on the revolving plate it will describe a curve making a certain number of revolutions around the center of the plate. As the number of revolutions per second is accurately known, the number of revolutions on the plate will give the exact part of a second the lightning flash has lasted. The results from this contrivance have been very successful. The Weather Bureau will shortly issue a pamphlet on protection from lightning, which was written by Mr. McAdie. It will give some important statistics of actual losses, together with the theory of protection.

There will also be directions for procedure in cases of apparent death from lightning stroke. Statistics show that in five years, from 1890 to 1895, 1,120 lives were lost, an average of 224 lives a year. The greater number of accidents occur in the five months from April to September. The report will show that many persons injured by lightning stroke die because of a lack of proper attention. In many cases animation is merely suspended, the shock causing the sudden arrest of the respiratory and heart muscles. The directions are based upon Dr. Augustin H. Goelet's book, "How to Deal with Apparent Death from Electric Shock," revised and modified for cases of apparent death from lightning by Dr. W. F. R. Phillips of the Weather Bureau.

Things Seen by an Engineer in a California Electric Light Station.

An engineer who recently "looked over" an electric lighting plant on the Pacific slope had this to say about it when the inspection was at an end:

A barn seems to be the proper kind of a building in which to place electric machinery, engines, boilers, etc., for a central station, that is, if the barn happens to be located in the central part of the city.

I think this station one of the best and most conveniently arranged places I have ever seen—for a man in poor circumstances, who has an accident insurance policy, or is desirous of assisting his family by sacrificing a few limbs for good fat damages. High speed belts are more plentiful than passageways, and there are no guards nor rails to prevent a man from trying the speed of the belts. In fact, there are some things that would be of considerable assistance to him in such an undertaking. There are belts running just a little below the surface of the floor, which is well lubricated and slushed.

If a man got into one of the belts, or took a few turns around the unprotected ends of one of the shafts, I think that his family would be entitled to all that the law allows.

Speaking of the floor, it was impossible to tell what it was made of. However, there was oil and dirt in a great number of layers. One of the attendants was directed to clean up the floor, and started in with a hoe. I advised him to get a plow to start with, but he thought he could find bottom after a while without it. No rubber mats are used around the dynamos, and on asking if there were none around, I was informed that oil insulation was the latest fad. This is certainly an economical idea in a place where two 50-light arc machines are run in series.

All station and switchboard wiring is done with weatherproof wire, whether it be a 1,000-volt alternating circuit or a 4,000 volt arc circuit.

The switchboard connections are a puzzle beyond solution, and the arc switchboard is located in a small bay, with the incandescent switchboard in front, making practically a closet of it. This closet seems to me peculiarly adapted for electrocution purposes.

Light where it is manufactured seems to be a luxury. There are in this station eleven 16 c. p. incandescent lamps and one poor arc lamp to give the necessary light to operate five engines and ten dynamos. As for reading the instruments during the tests, I found it necessary to use a lantern. This lantern was, I suppose, the emergency light of the station, and had a globe which I was told was broken last winter. All the lantern oil in the place was in the lantern, and lasted for about two hours. The interesting points were very numerous, but their general tenor was monotonous and uniform, and it is needless to say that the station was not paying very large dividends.—*The American Gas Light Journal.*

M. Berthelot announces that he has succeeded in making argon combine with bisulphide of carbon under the action of the electric discharge. M. Berthelot subsequently recovered the argon that had combined with the bisulphide of carbon.

Attempted Elevator Monopoly.

MR. FRANK J. SPRAGUE REPLIES TO MR. R. T. CRANE.

To the Editor of ELECTRICITY.

DEAR SIR: Your issue of July 17 contains a letter from Mr. R. T. Crane, President of the Crane Elevator Company of Chicago, for answering which I have to ask the courtesy of your columns.

Mr. Crane's letter, like many of the moves which have been made against the Sprague Company, will, I think, prove a mistake. It was probably written under some misapprehension, and certainly in ignorance or disregard of a number of important facts with which he should be familiar. It is interesting as containing some important admissions, notably the responsibility of the Crane Company for the legal attacks made upon the Sprague Company through the Minneapolis Court House Commission, despite the vociferous denials to the contrary in the public press at the time.

Mr. Crane's letter treats of three things: The attack of ELECTRICITY upon the hydraulic combination, the general subject of elevators, and finally a letter concerning elevator tests.

So far as the first is concerned, since the Sprague Company has nothing to do with it, present discussion would not be pertinent. If it pleases ELECTRICITY to take up as a subject for investigation the doings of the hydraulic combination that is a matter which concerns it. Attacks which we make are made directly, and not, unless we are forced to do so, through the medium of any newspaper.

That ELECTRICITY should be fortified in its assaults by a paper written by me may be a misfortune for the Crane Elevator Company, but I would remind Mr. Crane that the existence of the Minneapolis paper is directly due to attacks which his company made upon us at the time. So for the present, as far as that subject is concerned, I will leave the Crane Company and your paper to fight it out on your own lines.

Mr. Crane says that I have taken the bull by the horns. That is true, but I am not in the habit of taking hold of an obstreperous animal at the danger point unless I am pretty certain of my grip, and that in the end the bull will have to come down. It will be so in this case.

Let me examine for a moment this particular animal and see why its aquatic blood is so aroused by the subject of an electric elevator.

What is an hydraulic elevator system? Is it something unique? Is water in itself a power as distinguished from electricity? Do the various elements which go to make up such a system in themselves represent the best typical methods in power generation, transmission or utilization? Let us examine it in detail.

It consists primarily of a steam cylinder, or a multiplicity of steam cylinders, worked ordinarily under poor conditions of steam economy, that is, with a fixed cut-off in the high pressure cylinder of a compound pump, and no cut-off in any cylinder of a simple pump. This element corresponds to the cylinders of a steam engine in the electric system, which use steam expansively with a cut-off varying according to the load, and under pressure conditions which are somewhat better than exist in a pump. It is to duplicate the results of this system of variable cut-offs and steam expansion that the energies of the various pump builders have been more or less ineffectually bent for a great many years in plain acknowledgment of that defect in their simple and duplex pumps, the latter of which is common to almost every hydraulic plant of any moment in the United States.

The next element is the water cylinder, which corresponds to the dynamo in the electric system, and on account of the high friction due to packing, the efficiency of a water cylinder with its valves is not ordinarily equal to that of a dynamo, which with a motor stands to-day the typical example of an efficient energy converter.

The next element is the piping and the tanks, compression or roof, and perhaps an accumulator, into or through which the water is pumped for delivery to the controlling valves of the elevator, and the element which corresponds to this in the electric system is its simple wiring, and if a storage battery is used, then this last in conjunction with it.

Any competent engineer knows that measured by standard practice a given number of pounds of energy can be delivered to the controlling apparatus of an electric elevator for less pounds of steam, that is, water evaporated, through the medium of no less than fifty combinations of engines and dynamos, than can be delivered to the valves of any hydraulic cylinder through the standard pumps permissible in average elevator service. To be specific, the average water evaporation on a compound duplex pump, which is almost universally used, will in practice be not less than about seventy pounds per H. P. of water energy delivered to the valves, whereas the electric combination will easily give the same for less than forty pounds.

There are exceptional conditions in which a higher steam economy can be gotten in an hydraulic system, but they are few and are not typical, and under equal conditions the steam consumption in an electric system can be cut in two.

But this is not all. The fact is persistently ignored, although the attempt is made to offset it by recent experiments with a differential piston, that a standard hydraulic elevator uses the same amount of water under the same pressure for every foot of travel of a car, which volume of water and pressure are determined by the maximum load which has to be carried, although the average load on the rope, including the excess of car over counter-weight, is not over one-third of the maximum. On the other hand, the electric elevator uses, and must use, under normal conditions, current directly proportional to the load, modified in a small degree by starting and slow running.

In short, over and above the friction load of the generating system, the steam consumption in the engines the generation of electricity in the dynamo corresponds instantly and absolutely with the demand of the elevator machines. It is a system which is of necessity automatic. On the other hand, the hydraulic system is one of the most flagrant violators of the relation which should exist between demand and supply. It is a system of transmission by water, having at one end a generating plant doing full duty for every foot of travel of its piston, with a variable duty on an elevator car at the other end, and an intermediate straight line water engine with its pipes and tanks taking care of that variable duty and using the balance of its energy in heating the water which passes through its valves.

So much for Goliath—let us turn to David.

Mr. Crane waxes historical and says that in the early introduction of electricity as a power, quite a number of elevator builders immediately went to work to perfect and build electric elevators; and he states that the Sprague Company has violated pretty nearly every well-established law in the development of its apparatus.

I will have to call Mr. Crane's attention to a little history and a few facts. Almost the first, if not the first, commercially operated electric elevator in the United States, which continued to operate, was installed by the writer, now some eleven years ago. It is true it was a freight machine, and with nothing particularly characteristic of it excepting the fact that electricity was used. It was nearly five years before the elevator companies would concede in the slightest degree the utility of even this use of electricity, and almost the first move in this direction was its minor use in connection with a gas engine to operate a pump. This particular infant early gave up gasping for breath, and it is not now a serious factor in the elevator field.

Mr. Crane intentionally confuses the Sprague electric elevator with that which has been built by other companies, and while acknowledging, as did all his business associates, who accommodatingly signed affidavits against us at Minneapolis, that their own electric elevator was unfit for serious office duty, attempts to apply the same limitations to our machines.

I would remind him that there are two types of machines, one the worm gear and drum, and the other the screw, and that while this company builds both, the hydraulic companies build only the former; that as they make a limitation in the possibilities of that type, so does this company draw an absolute line of distinction between the possibilities of the two, and that on the score of limit safeties without regard to anything else whatever.

Mr. Crane complains that we have violated the best principles in elevator practice. In order that he may understand perhaps a little more fully just what the screw machine is, I will briefly describe it.

There are in such a machine three things besides safety and economy to be considered. These are the multiplying sheaves, the nut and screw, and the electric motor and regulator. With regard to the first, all that can be said for or against them is nothing more nor less than the stock arguments for the various types of the vertical and horizontal hydraulic machines, because the rope movement is practically the same.

As to the nut and screw, we may be pardoned if we have not taken into our confidence the representatives of the hydraulic interests; but the so-called "impossible" ball, nut and screw keeps on working twenty-four hours a day, with less wear and tear and depreciation, measured in dollars and cents, and less trouble, than are common to the piston packing and cylinders of its competitors.

Antiquity is not the only gauge of merit, nor is experience a part of the capital solely of the hydraulic companies, for so far as the motor is concerned, while not so old as the hydraulic elevator as a commercial machine, there have been built since 1888, on the model and type originated by me, for railway work alone, more electric motors than there have been built hydraulic elevators by the combined companies in this country during the past twenty-five years. So that as regards perfection of construction, capability of standing severe usage, and for general utility and reliability, the electric motor, notwithstanding its youth, will compare very favorably with its aged rival.

In the three years that have passed, despite all the efforts of opposing interests, this screw machine has been developed to a state of perfection in which certain characteristics are well established, to which I will call attention.

Compared with the hydraulic, it is as safe, or safer, for not only has it all the safeties which the older system has, but it has two new ones — the centrifugal, which prevents a car running away too fast under certain conditions, and an automatic car control—neither of which is practically possible to the hydraulic elevator.

The machine has any required lifting capacity and speed. It has any required refinement of control. It can be started as suddenly or gently as desired.

It occupies less space, most appreciably so in high buildings, and all the machinery is in the basement, where it belongs.'

Like parts in different machines are interchangeable.

It is far more accessible. Most of the wearing parts are in plain sight, and repairs when necessary can be made in a shorter time and with less outside extra work.

It can be run from a local plant or from the street, and its cost of operation, measured by repairs and coal consumption, is less than one-half that of the standard hydraulic elevator.

Mr. Crane, while admitting that there is a field for electric elevators when supplied from a central station, naively says that "it never occurred to him" that when departing from a central station supply a private generation of electricity could be economical on the scale required in an elevator service. Where has Mr. Crane been for the past few years? Is he not aware that this same question was long ago settled in the matter of generation of electricity for lighting under the conditions which exist in large buildings? Is he not aware that almost every large office building in the United States, every hotel, in fact every building of appreciable size, finds that, all things considered, it generates current for less than central stations at present will generally supply it, and in fact that they are so generating current? Does he not know, and if he does not, should not his engineers know, that a central station has in addition to the cost of generation the cost of distribution and meterage, that it must oftentimes pay an interest on patents, must earn a dividend on bonds and capital representing more than the actual cost of its buildings, land and equipment? Does he not realize that many of these charges do not exist in an ordinary office building, that no additional land has to be bought for its plant, that there are no patent expenses, that there are no costs for distribution, no municipal or aldermanic expenses?

But this is not all. Every engineer knows that the fewer the number of well proportioned units the more alike they are, the greater the interchangeability between themselves, and the greater the extent to which any one unit can be utilized, the better the system for power generation and conversion, no matter what its character.

The best modern practice makes a three-unit direct-connected engine and dynamo plant the best for lighting a building. There is an empyrical relation existing between the number of lights required in a building as ordinarily designed and the elevator service.

When in addition to the lighting service such a building adopts electric elevators it is not now necessary that it shall add an independent generating plant. All that is required is that its three units should be somewhat increased in size, that their mains shall all be taken to a common switchboard with 3-way switches, and every engine and dynamo thus made interchangeable on either the lighting or elevator circuit, and at times both can be run from the same engine and dynamo, so that instead of five or six units, some water and some electric, the entire generating plant is reduced to three units, each of which is interchangeable, and one of which is almost always in reserve. Does this engineering fact appeal to Mr. Crane? Possibly not, but it is a system which has already been adopted in a number of important buildings which this company is equipping with elevators.

Apparently Mr. Crane is not very familiar with the present status of electricity in its application to the transmission of power, a field in which the writer by good fortune has been somewhat active, and in order that he may, through reasoning by analogy, learn something of the probable future of the electric elevator, I will touch briefly upon some of its developments.

Why has the trolley system, born only eight years ago, driven the horse from the street? It involves great initial expense, the conversion, distribution and re-conversion of energy. It faced all the powers of conservatism, ridicule and fear. It had to combat the allied forces of the Bell telephone interests, tested by court action in over twenty States. It had the opposition of the strongest municipal and corporate influences. Every detail of the system had to be created, and yet it stands to-day unrivalled in its industrial progress.

Why is the same trolley system driving the cable to the wall, and why has its adoption marked the abandonment of a plant costing not less than $3,000,000 in the city of Philadelphia? Are there many more examples of the direct applications of force than the cable system, many closer connections between a great engine built for the highest economy and that which it moves?

Why is the steam locomotive giving way to the electric motor on suburban service? Is there any more direct example of the application of steam than is presented by a locomotive, the power of whose cylinders is transmitted directly to the drawbar through the intermediary only of a crank?

Why does the best shop practice dictate the abandonment of the slow speed, highly economical Corliss engine and the direct application of power by belts and shafting, and adopt the high speed engine and direct-connected dynamo at a central station, with the conversion, distribution and reconversion of energy by a dozen different motors at a greatly increased expense? Is it for any other reason than convenience, reliability and economy of operation?

Why has every overhead crane builder in the United States within the past four years absolutely abandoned wire rope, square shaft and hydraulic transmission for the three-motor transmission advocated by the writer only nine years ago? Is it because it is simpler, because it will cost less, or because it is more economical, more flexible, and because it answers the purposes better than the other and more direct systems?

Why have the great central stations of the country adopted electricity for the transmission of power to the hundreds of industries within the radius of their supply, and into what form of energy is the power of Niagara being converted?

In short, why is the transmission of power in almost every case where flexibility, convenience, economy, efficiency and reliability are required depending upon the electric method, not only in new work, but oftentimes to the replacing of older plants.

And so, perhaps, Mr. Crane believes, and hugs to himself the cherished thought, that the hydraulic elevator is to be the one bulwark to stand up against the assaults of this modern giant, that it presents such fixity of design, such refinement of processes, such excellence of results, such unchangeableness of methods, that its synonym is perfection.

As well might he and his confreres attempt to stem the tides.

Electricity is to the progressive man, to the modern engineer, a scientific religion. The belief in its future is in the air we breathe, the record of its accomplishments touches our daily life on every hand. Its progress does not depend upon one individual, but in its various departments more money is being spent, more energy concentrated, more brains are active than in any other industry in the world.

The hydraulic interests have depended upon their intrenched position, but now that the electric elevator is a success, there are other forces which will bring it rapidly to the front. The younger generation of engineers, men who are in the forefront of electrical development, men who are not tied down by conservatism, which is oftentimes the synonym of cowardice, believes in them. The system of generation which I have outlined appeals to them. The self-interest of dynamo and engine manufacturers is in the direction of electric elevators.

Owners of buildings, being themselves oftentimes owners of electric railways or central stations, see no reason why if electricity can be applied on one of the most difficult services in the world—that of traction—it should not be equally well applied to elevator service. The architect and builder sees the number of units in his building diminish. They see less variety and extent of piping, the bugbear of every building; less space is occupied; and the mountain of difficulties which has been raised by the self-constituted authorities on elevator practice are disappearing like the mists on a summer morning.

Mr. Crane says plaintively that the electric elevator is like other new things=that people may possibly take it, and perhaps they will pay more for it. I suppose he speaks with a keen appreciation of his own experience in new things, to wit: his recent devotion to high-pressure hydraulic elevator service, and possibly the history of the Schiller Theatre with its thrice constructed plant appeals to him with a good deal of force. So far as cost is concerned, it is not because the electric elevators have been offered at so much higher price as that the hydraulic elevator, in the attempt to save the situation, has been offered at a particularly low price, so that in effect people have been willing to pay a higher price, varying from 5 per cent. to 20 per cent., which is perhaps the worst possible commentary on the hydraulic elevator; and in the several instances in which the electric replaces the hydraulic and steam elevator, a notable example of which was in the Board of Trade, Chicago, the difference in cost is the entire cost of the elevator plant.

With regard to Mr. Crane's letter, the time is past when I can consider it seriously, but it may interest your readers to know how the letter came to be written.

When the subject of elevators was recently being considered for an important building in Buffalo where the building committee had relegated its powers of selection to a contractor who was under heavy bonds for the completion of the work within a given period of time, there was a meeting of the representatives of a number of the principal elevator companies called by the building committee to consider the possibilities of a comprehensive test between hydraulic and electric elevators. One of the hydraulic companies and ourselves had expressed a willingness to have such a test made, and the other hydraulic companies were likewise requested to become participants. These very remarkable conditions, however, were laid down, to wit: that the Building Committee was not aware what elevator the contractors considered most satisfactory in regard to price and other particulars, or what elevator would be selected by the architects, and that they would not wish to be bound in any way by the decision of a committee to accept the Sprague elevator whatever might be the result of the proposed test. It was further stated that the sum which would be paid for an elevator plant would not exceed a fixed amount.

I at once pointed out the absurdity of such conditions, and the utter uselessness, at least so far as we were concerned, of a test having no assured practical result, and called for the reading of letters addressed to the committee, which stated our position then and states it now. From these letters I make some extracts as follows:

"The Sprague Electric Elevator Company proposes the most comprehensive test of its electric machines, screw and drum, against the hydraulic and electric machines of all competitors" "under experts at a definite pay, the loser to pay for their services, none of the experts to be connected directly or indirectly with any electric or hydraulic elevator company."

"Five of the principal elevator companies are operated together as a trust, and since the hand of every one of them is raised against us, to make any test take in every company operating under like conditions."

"The object of a test of this kind, however, is not purely scientific, and if we go into a general test it will be for the purpose of demonstrating the superiority of the electric elevator as a system against all hydraulic elevators of whatever type or character."

"The test which we shall demand would be one involving every detail of manufacture, every element of construction and operation, and every emergency test that elevator experience has proved should be applied if the results of all the accidents which may and which have occurred are to be predicated. When that test is finished it would only be equitable, and it must be made a condition by the architect, the builder and your committee that if the result bears out the statements made by the writer, and the report of the committee is in favor of our machines, then the contract shall be awarded to the Sprague Company at an equitable price, recognizing in some measure the capitalized difference in the economy of operation."

"We prefer to have the very best men which can be obtained, which experts shall not come to New York under compliment to any company, whose expenses are not predetermined by any competitor, but as the best known independent experts in the departments of electricity, steam, water and mechanics, who have the necessary knowledge to make a most thorough investigation, and whose report will carry with it the weight which we wish."

"We repeat that if this test is to be made it must go to the bottom, and the examination shall be not only of existing plants, but the records of them shall be produced, and if the committee's report is in favor of this company, the contract must be awarded to us."

I further stated that the Sprague Company was through with guerrilla warfare, and the time had come in its history when tests should not be individual but collective, not partial but complete. There was, and could be, no misunderstanding of our position.

After several hours' deliberation, the building committee announced that it would take a day to consider whether it would take the responsibility of a decision as proposed.

For reasons best known to itself, it elected not to do so, and notified the Sprague Company that it did not consider it best to have the test go ahead. Although the position taken by the Sprague Company at Buffalo was somewhat succinctly stated, the Crane Company, after a year's silence and a year's successive defeats, suddenly woke up, and its vice-president, who, although never having seen a Sprague elevator, was sufficiently complacent to sign an affidavit for use against it in the injunction proceedings at Minneapolis, and Mr. Crane, who is not over happy in the selection of his subordinates, finds time to address letters to the Sprague Company proposing a limited test.

They must have known that under the circumstances little attention would be paid to these communications. That time had passed. The Crane Company's treatment of the Sprague Company in every business relation, and the result of the commercial warfare between the two companies made the expectation of an answer futile.

It should be almost unnecessary for me to point out what has been done in the past eighteen months by the representatives of the hydraulic interests to stem the advance of the Sprague Company. It was the openly avowed intention to prevent the Sprague Company supplementing the Postal Telegraph contract, no matter at what cost. There was no criticism which could be made, no objection which could be raised, no misrepresentation so weak, but that it found ready promulgation at the hands of its agents. And with results?—an advance almost unmatched in an industrial development and bidding fair to rival that of the electric railway, and no power, whether it be that of past accomplishment or future promises, either statement of fact or misrepresentation, can check its advance.

I would remind Mr. Crane that courtesy is not a one-sided business obligation. For two years the statements of the Sprague Company concerning its apparatus have had widespread circulation through architectural and other papers. Over ten months ago, before this company had achieved its present position in the elevator world, it made a direct challenge in Minneapolis against every hydraulic and pump company, and especially against the Crane and Worthington companies to which it received no reply save vicious and unbusinesslike treatment by its opponents. It followed this with letters to the Worthington Company, whose agent I believe the Crane Manufacturing Company now is, concerning statements about the relative economy of hydraulic and electric elevators made by its representatives—equally to no effect. It addressed a registered letter to an official of the

Crane Company, as well as to others, calling attention to misstatements with which he was credited, and got no reply. It published in pamphlet form these challenges and letters, months ago, and they still went unnoticed. It challenged every hydraulic company in the United States at Buffalo to the most comprehensive test ever proposed for elevators, on the sole condition that that investigation should be comprehensive, by capable experts, that every company should be party to it, and that whatever system, whether electric or hydraulic, which should be declared preferable, should be accepted by the building committee, architect and contractor, at an equitable price; and the test was declined by the committee.

And now comes Mr. Crane, solicitous for the public welfare, and says that his company "as elevator builders owe it to the purchasers of elevators to give them all the light they can," and further that his company "as elevator builders are most decidedly interested" in the subject. Quite true. As a company doing business with the public, we now take our own method of making known the facts to that same public, and that we have effectually done so is demonstrated in part by the fact that, in addition to our other work, in every single contest since the first of December, 1894, in which the decision has narrowed down between the Crane hydraulic or electric and the Sprague electric elevators, the Crane Company has been defeated. There is absolutely not one single exception; and in order that there may be no misunderstanding, I give specific instances, as follows:

Parrott Building, San Francisco, 15 elevators.

City Hall and Court House, Minneapolis, 4 to 12 elevators, against 13 lower competitive bids.

Guaranty Building, Buffalo, 4 elevators.

Currier Bank Building, Los Angeles.

Safe Deposit Building, San Francisco.

Academy of Music, San Francisco.

Board of Trade, Chicago, 4 elevators, throwing out Crane hydraulics.

Union Trust Building, Detroit, 5 elevators.

In every one the contest was between the Sprague and the Crane machines as the typical standards, and the architects, builders, owners and experts were as varied as the locations of the buildings. Of course, the ingenious hydraulic agent or principal will find a new excuse for each defeat, but whatever the excuse, however ingenious the reasons, the defeat still stares them in the face, and the fact remains that the hydraulic elevator is coming down and the electric elevator is going up.

It is now a matter of indifference to us what the hydraulic man may wish to know about electric elevators. It does not concern us whether he believes the statements which are made in behalf of electric elevators. We are not dealing with him, except when we come in competition with possible purchasers, and these purchasers have every privilege to make any investigation which the conditions of the service of any plant makes possible; and when the stake is sufficiently high, and when we can pin the various hydraulic companies of this country, with all their various systems and the multitudinous claims which each advances for his own, down to one comprehensive test, and upon the result of that test shall depend the award of a contract of sufficient size, then this company will be found entirely prepared to have such test made.

Meanwhile, knowing perfectly well what the average water consumption of the standard hydraulic plants is, this company is prepared under premium and forfeiture arrangements to guarrantee absolutely the average electrical energy per car mile of travel, which will not be one thing here and another there, except as to small differences, and if we install the engine and dynamo plant, then, with any one of fifty combinations of engines and dynamos, we will likewise guarantee the water consumption. As I say, we are absolutely unconcerned as to what the hydraulic man believes. The greater his unbelief in the possibility of electricity, and the longer his persistence in it, the better it is for us, because when dealing with the public we have ample means of demonstrating the points of difference, and with our shops running day and night, and with contracts of a character and number to warrant our continuous and rapid growth, we can rest reasonably content for the future.

Frank J. Sprague,
Vice-President Sprague Electric Elevator Co.
July 25, 1895.

The street railway systems of Philadelphia have been consolidated under one management and a similar deal is on foot at Pittsburg.

THE ELEVATOR TRUST.

[The following letter, apropos of Mr. Crane's letter in a recent issue, from a leading elevator manufacturer, will be of general interest. It was not intended for publication, and for this reason the name of the writer is withheld.—Ed.]

If two or more men have a right to unite and form a partnership we have never understood why it would not also be right for two or more firms to unite, if by so doing they could purchase or manufacture more cheaply.

Anyone who has watched the course of the business combines or trusts that have been formed almost without number during the last few years knows that they have not been content merely to combine and get such benefits as might come from such a combination of capital and forces.

A number of firms in a certain line of trade and manufacture have got together to control that line. After they have got as many firms to work together—often nearly all—they have set to work attempting to force into their combine those who have felt that their best interests lay in doing business as independent firms.

Here comes in the great wrong of the whole affair. The combines have known they could not control the business so long as there were firms they could not control, and the means they have resorted to to force these independent firms either into their combines or out of business is something an honest man can think of only with indignation.

Many of these trusts or combines are reaping their just reward. Some are practically financially bankrupt while others are bankrupt in reputation.

The Elevator Trust stands probably alone in the fact that it is a secret Trust; that while outwardly the firms in the Trust are doing business independently as before, they are organized under another name, so a business man going to a directory to select firms to give competing bids for an elevator might chance to select the names of the firms in the combine, and so there would be no competition in the bids though they apparently came from different firms.

While the patents were pooled in another name, each firm in the Trust has a right to sell and sue under these patents so an independent elevator firm might have a "fake" or other patent suit brought against it in the name of one of the firms in the combine, such a suit proving exceedingly expensive to the one sued, while the money being furnished by the Trust would make the expense light to the firm in whose name the suit was brought.

This letter (the Crane) confirms all that Electricity has said in regard to an attempt being made by the Trust to keep the electric elevator out of the market. The burden of the letter is "The man would be bold who would say that the electric elevator would take the place of the hydraulic" (quoted from memory). Now, I do know that Mr. Otis sneered at the idea that the hydraulic would take the place of the steam elevator for passenger service, yet how completely the hydraulic elevator had taken the place of the steam elevator a few years after that sneer was given is well known.

If the only argument to be used against the electric elevator is that the man would be bold who will predict a great future for it and who believes it will take the place of the hydraulic elevator as the hydraulic took the place of the steam elevator, then such an argument would have been good and valid to use against the man who had been bold enough to predict the great things that were to be in all lines of engineering progress and progress in all lines by men whose names we delight to honor.

It could have been used against the locomotive and the steamship (I believe it was used against the steamship); it could have been used against all the vast achievements of the dynamo and motor, and we should have had none of the thousand resultant blessings which the dynamo electric machine has brought, nor of the promise of the still greater things yet to come.

Now as to the proposed test. A test was proposed some months ago, I believe, by Mr. Sprague and not accepted. I have not seen Mr. Sprague in this matter, but have no doubt that he would be glad to make such a test as soon as time permits, for I know that each minute of his time is needed to direct the vast business that is growing on his hands, as the sale of his high-speed electric elevator has amounted to hundreds of thousands of dollars, as many as fifteen of the elevators going into one building, and they are going into buildings of the highest class. Anyone who has ridden on a Sprague electric elevator knows the delight of being taken rapidly to his destination in an elevator under the perfect control of the operator and one that can be started and stopped, not with the unpleasant sensation sometimes experienced in the hydraulic, but rather as a bird rises from the ground and settles down again, so perfect is the electrical control.

The Appleton (Wis.) Edison Electric Company is seriously embarrassed by the recent order of the Secretary of War directing it to cease using the water power which it has depended on for fourteen years.

LONG DISTANCE TRANSMISSION AT 10,000 VOLTS.

(The Pomona Plant.)*

BY GEORGE HERBERT WINSLOW.

The Pomona plant was installed in the summer and fall of 1892 for the San Antonio Light and Power Company of Pomona, Cal. It was increased in the following spring, and early last year the capacity of the plant was doubled by duplicating the entire equipment. At the present time, when the plant has been in regular operation for more than two years, and its complete success has established confidence in the successful outcome of many similar projects of greater magnitude, it seems fitting to present a careful description of the entire installation. The electric plant was installed under the personal direction of the writer, as electrical engineer, who presents many of his personal observations on its construction and operation.

The plant is used to transmit energy from a waterfall to substations at Pomona, 18¾ miles distant, and San Bernardino, 28¾ miles distant, from which points it is distributed for incandescent and arc lighting. It consists of a Pelton waterpower plant and a Westinghouse alternating current transmission plant in which generators supply currents to sets of raising and lowering transformers operating at 10,000 volts, and delivering current to the local circuits at 1,000 volts.

The water power for this plant is derived from the San Antonio creek, which is chiefly supplied by the melting snows and the rains on San Antonio Mountain. Side canyons, however, also furnish some water. The creek flows for several miles through a narrow valley at the upper end of the San Antonio canyon in a bed which it has washed for itself in the layer of boulders and gravel formed by the action of an immensely larger stream in past ages.

At the lower end of the valley a sharp ridge extends eastward from the side of a neighboring mountain, from which it originally split off, and blocks up the valley except at a narrow place at which bed-rock is exposed and through which the stream plunges suddenly downward at least 90 feet between precipitous walls of rock, forming the San Antonio Falls.

To utilize this fall, part of the water is diverted by a dam about 200 feet above the falls into a canal which conducts the water to a tunnel passing through the ridge. At the other end of this tunnel the water enters a large pipe leading to the power-house, which is located 412 feet below the level of the outlet of the tunnel.

A vertical projection of the pipe line, giving the sizes of the pipe, is shown in Fig. 1.

The pipe is of sheet steel, double riveted throughout, and was delivered on the ground in sections having a length of 11 feet 6 inches. These sections consist of four sheets, each 3 feet long.

The diameter of the pipe up to within 450 feet of the power house is 30", with the exception of the length which connects it to the sand-box at the top of the pipe, which length is considerably expanded so as to allow the water to flow slower on entering, and thus to reduce the entrainment of air. Near the power house a "reducer" is inserted in the pipe to reduce the diameter to 24", and this size is maintained from this point to the power house. The pipe was designed to carry 2,000 miner's inches of water (measured under a head of 6 inches), without unnecessary loss of friction. The capacity is equivalent to 50 cubic feet per second, or 1,882 H. P. at 390 feet effective head, assuming a wheel efficiency of 85 per cent.

---

*A paper presented at the Twelfth General Meeting of the American Institute of Electrical Engineers, Niagara Falls, June 27, 1895.

This is nearly three times the power for which the present station was built, but the extra capacity of 1,000 H. P. obtained by increasing the capacity of the pipe costs so little when compared with the cost of building an entire new pipe line that it is much more profitable to lay the larger pipe in the first place, if sufficient water can ultimately be developed to utilize the added capacity.

The thickness of the pipe is increased as it nears the power house to provide for the increase in pressure in the lower parts. At the first bend it is made greater than that of the section above it on either side, because the pressure on it there is greater. After passing the second air valve, first No. 10 and then No. 8 steel is used, the latter size being continued to within a short distance of the power house. The last few lengths are of No. 6 steel.

The horizontal distance between the mouth of the tunnel and the power house is 1,940 feet, and the difference in level between the tunnel and the floor of the power house is 412 feet. The total length of the pipe is 2,370 feet.

The sections of pipe as received from the makers were coated with asphalt both inside and out, and parts of this coat were of course scraped off through rough handling. After the pipe was laid and jointed, a man went through it and painted the joints with hot asphalt to prevent rusting.

In order to protect the pipe from the great changes in temperature which occur in the mountain between midday and midnight, earth and loose rock were placed around and on top of the pipe without any tamping, and where enough earth could not be conveniently obtained brush was cut and piled on the pipe and covered with a light layer of earth and rock.

The lower end of the pipe is closed by means of a 4 inch Ludlow gate-valve, which is bolted to a cast iron flange riveted to the end of the pipe.

The stem of the valve is geared to a small hand-wheel, partly on account of its weight, but chiefly in order that the gate may not be shut too quickly, as otherwise the pipe would be subjected to severe strains, resulting from suddenly checking the velocity of the column of water.

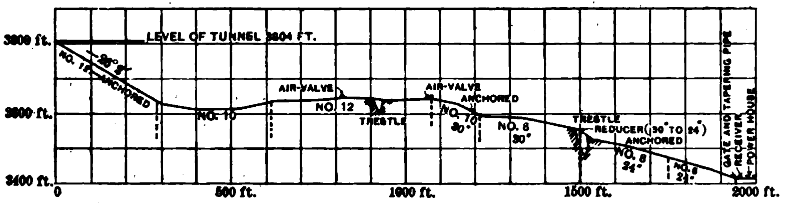

FIG. 1.—PIPE LINE, POMONA PLANT. HEAD 398 FEET.

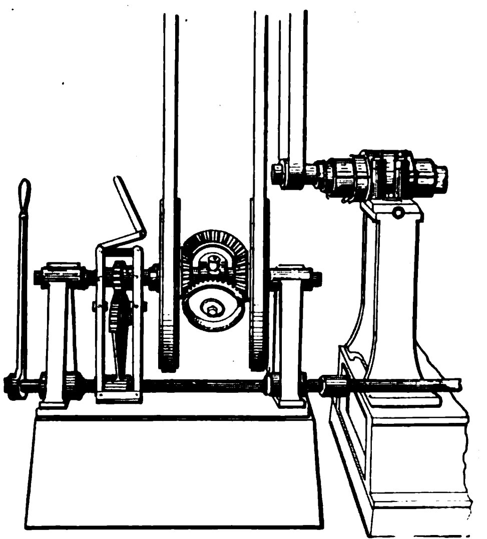

FIG. 3.—WATERWHEEL GOVERNOR.

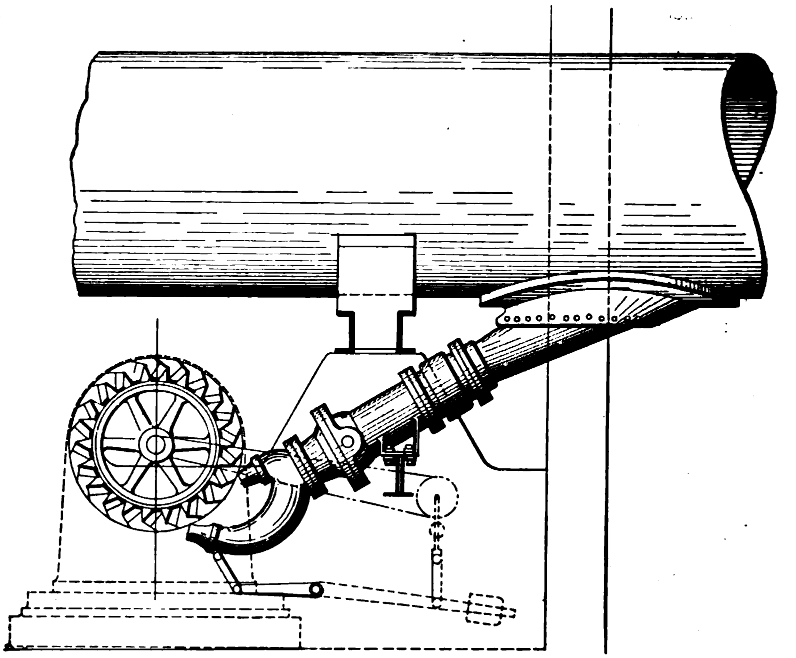

FIG. 2.—PELTON WATER-WHEEL WITH DEFLECTING NOZZLE.

For use under heavy pressures the gearing is also necessary in order to be able to move the valve at all. The head of water on this plant is so great that it is impossible to open the valve while the pipe is full and the receiver empty. It is therefore necessary to equalize the pressure by filling the receiver through a by-pass, or to partially empty the pipe by means of a relief-valve attached to the pipe close to the gate. The relief-valve is primarily designed to protect the pipe from shock by allowing the escape of a considerable quantity of water in case of an increase of pressure in the pipe; such, for example, as would occur should any obstruction partially close the opening of the gate. It has a circular valve so proportioned that a slight movement of it will afford a large opening for discharge. The valve is held in place by a weighted lever, and is set so that a very slight increase above normal pressure will cause it to open.

The gate is connected by a tapering pipe of steel to a horizontal cylindrical steel receiver 20 feet long and 42" inside diameter, from which the water is distributed to the wheel. The object of such a large receiver is to avoid the loss in head which would be occasioned by the eddies formed when drawing the water from the side of a smaller pipe. It also serves to keep air from being drawn into the discharge pipes in case it accumulates in the receiver. (Last year the receiver was lengthened to 48 feet.) An air-valve is placed at the top of the receiver.

Two tapering cast-iron pipes (a large and small one) are bolted to the lower side of the receiver at an angle of 30 degrees. These pipes conduct the water from the receiver to the under sides of two independent Pelton water wheels, which drive an alternating current generator and its exciter.

To the end of each pipe is attached a Ludlow gate-valve, the stem of which passes horizontally into the dynamo room through a bushing in the concrete wall. The larger of the two stems is geared to a hand wheel; the other is fastened directly to a smaller hand-wheel. The flow from each pipe can thus be completely controlled from the dynamo room. The pipe running to the generator wheel is provided below its valve with two nozzles cast in one piece and attached to the valve by means of a limited ball-and-socket joint, which permits them to be moved vertically to deflect the water. (See Fig. 2.)

The pipe supplying the exciter wheel has below its gate a throttle-valve, the stem of which passes through the wall into the dynamo-room, where it can be connected to a governor. The wheels are directly below the receiver and above a raceway which conducts away the water after it drops from the wheels.

The speed of a Pelton wheel is dependent for a given load and head of water upon the amount of water striking the wheel, and therefore to maintain a constant speed this amount must be changed every time the load changes, and in proportion to the latter. In the case of the generator-wheel this change is produced by deflecting the water. Constant-speed regulation may also be obtained by throttling the water, as is done in the case of the exciter-wheel. When the water is throttled there is loss in efficiency due partly to the scattering of the water as it flows from an aperture which it no longer completely fills (which causes much water to miss the buckets), and partly to the loss of head caused by friction in passing through the valve. With the deflecting nozzle there is no loss of efficiency due to this cause. There is, however, a great waste of water at light loads, since under a constant head the same quantity of water must be disposed of at all loads, and for light loads the greater part of it is wasted. To avoid this loss the use of a reservoir naturally suggests itself. It is an unfortunate fact, however, that high heads are confined to mountainous countries and that there a reservoir usually necessitates a high and consequently costly dam. The necessity of building a dam to withstand freshets so increases its cost as to make the use of a reservoir commercially impossible with high heads. Therefore the water must continue to be wasted, and the chief apparent objection to deflecting nozzles is seen to be of no importance.

A set of tips of different diameters is supplied with each nozzle, so that the size of the jet used may correspond to the maximum load and thus unnecessary waste of water be avoided. The tips for the generator-wheel range from $1\frac{1}{2}$ to $2\frac{1}{4}$ inches in diameter, while those for the exciter are from $\frac{7}{16}$ to $\frac{3}{4}$ inch. When tips are used of the proper size for the full load there is no need of throttling at the full load, and therefore no loss from this cause; and with the deflecting nozzle there is no waste of water at full load, so that for full load the two arrangements are equally good.

This is not, however, the normal condition of operation of a lighting plant, for in such a plant each dynamo is driven by a separate wheel, and the load is constantly changing, so that here the deflecting nozzle has the advantage. The deflecting nozzle is also to be preferred under high heads, to avoid the risk of straining the pipe by suddenly checking the flow of water, as would be necessary with a throttle valve if the entire load were suddenly thrown off.

Regulation by throttling is, therefore, only advisable in cases where the head is not excessive and where the quantity of water obtainable is limited, as is the case where it has to be stored in and supplied from reservoirs, or when the supply is liable to sudden stoppage. The writer recalls instances of its value in cases which occurred while he was at Bodie, Cal., in the fall of 1893. There the water was conducted 4,700 feet in an open ditch to the pipe, and was delivered by the pipe under 350 feet head to drive an electric generator for a 12-mile synchronous power transmission. In cold weather anchor-ice would form and suddenly block up the ditch at some curve, and the water-pressure would begin to fall slowly owing to the gradual emptying of the pipe, which could no longer be kept full by the diminished flow from the lower end of the ditch, which now acted as a reservoir. Having throttle valves in the nozzle, however, very little water was wasted, and the plant was thus kept running until the ditch was cleared, whereas with a deflecting nozzle the pipe would have been quickly emptied, even if the gate valves had been used as throttling valves (which is feasible if the load only varies slightly). Sometimes the head became so low that it was necessary to throw off part of the load and to run at reduced speed, to keep the motor in synchronism.

As already stated, the speed of the generator-wheel is maintained constant for different loads by deflecting the stream. This is done by raising or lowering the deflecting nozzles from the dynamo room by means of a lever fixed to a shaft which passes through the wall. The position of the nozzles is controlled automatically by means of the Pelton differential governor. The ability of this governor to keep the generator at a practically constant speed depends on the governor being driven at a constant speed. I say *practically* constant, for there must be *some* change in speed before the governor can act, and then an appreciable time is required for this action to produce its effect. The constant driving-speed in the present case is furnished by the exciter-wheel shaft. The arrangement for governing is briefly as follows: The generator is geared to stop itself by turning the water off the wheel, and the source of constant-speed is geared to speed up the generator by a contrary action. These two actions neutralize each other when the generator-speed is the same as the fixed speed, but when either preponderates the difference acts. Thus an increase in generator speed will act to stop the generator, while a decrease, by making the fixed speed predominant, acts to speed up the generator. The governor consists, in part, of two similar miter-wheels which are mounted upon pulleys and placed face to face, loosely, upon a horizontal shaft, and are driven at equal speeds in opposite directions, one by the generator shaft, and the other by the exciter shaft. The speed of the pulleys is 200 R. P. M. In Fig. 3 it will be seen that between these wheels and at right angles to the supporting shaft there is fixed to the latter a cross-bar carrying two miter-wheels, one at each end, which mesh with the two oppositely-revolving miter-wheels first mentioned. The result is that as long as the two outside wheels are revolving at the same speed the two central wheels will merely revolve upon their axes without tending to move in either direction the bar upon which they rotate. Now, if the generator speed increases, the corresponding side of each central wheel will have to travel faster forward than the other side travels backward, and the difference between these two movements will result in a movement of the central wheels in the direction of the faster wheel, and the cross-bar will consequently move the same way. The shaft to which the cross-bar is attached will, of course, turn with it, and as this shaft carries a pinion meshing in a toothed quadrant connected to the lever which controls the nozzles, the stream will be pulled away from the wheel until the generator speed falls to its normal value. This point is quickly reached with a full load, owing to the drag of the load, but for a light load the inertia of the armature and wheel prevents them from responding so readily, and the governor does not act quite so quickly. Consequently the generator is not only brought to its proper speed but is carried slightly above it, which causes the governor to reverse, and thus sets up a slight and regular *seesawing* in the speed. This seesawing will be increased if there is any lost motion in the governor and its connections. It will be increased because for a full head and light load the jets only impinge slightly on the buckets, and since the jets are round and their upper edges alone strike the buckets (which are themselves curved in the opposite direction), a slight movement of the governor produces a much greater change in the speed of the wheel under light loads than when the whole of each jet is in use. This effect of the jets is more marked when the governor is working to cut down the speed than when it is increasing the speed, because *withdrawing* the jets at a given distance causes a greater change in the quantity of water striking the buckets than would be caused by *advancing* them an equal distance. The seesawing will be further increased if the nozzles are not fully counter-balanced, as they would then tend to fall away from the wheel.

In order to avoid seesawing it is the practice in this plant to reduce the head every morning during the light load. This was at first done by opening the extra 4" relief-valve and allowing water to escape until the pressure had gone down to that corresponding to the desired head. The valve was then set tentatively until the pressure became nearly constant, when the final adjustment was made by partly closing the valve on the generator-wheel pipe. It was afterward found that the working pressure of the water at the nozzle could be sufficiently reduced by the last mentioned valve without also reducing the quantity of water in the pipe, and therefore the relief valves are no longer used for this purpose. In either case the governor throws more and more of the stream onto the wheel to compensate for the decrease in head, and the seesawing stops. Where a double deflecting nozzle is used it would seem advisable to have in the upper branch a throttle valve so connected to the deflecting levers that when running under light load the valve would be entirely closed, and the regulation be attained by deflecting the open nozzle. When the whole stream of this nozzle had come into use and more water was required, the valve would be opened. In this way the water would be used during light load under more favorable conditions than obtain with a simple deflecting nozzle, seesawing would be avoided, and in case the supply of water became less, either suddenly, as by a sharp freeze, or gradually, because of diminished rainfall, the water would be used most economically and efficiently during the time of maximum load, which is the critical time. The effect of such an arrangement of the nozzles and valves would be to increase the capacity of the plant for a given minimum water supply, the period of minimum supply being precisely that in which all possible economies are of value. It may be objected that tips of such a size should be used as would bring both streams into full use during maximum load, and that then no valves would be required, but against this is the fact that the maximum load (particularly in a lighting plant) does not reach the same value every night and that it is, therefore, always necessary to use tips large enough to meet the possible demand of any night.

In order to avoid breaking the teeth of the quadrant in case the governor should continue to act after it has moved the nozzles to either their highest or their lowest point, the pinion on the governor shaft is mounted loosely between two laterally movable toothed ratchets, which normally hold it in a fixed position. When the quadrant reaches either of its extreme positions, one of these ratchets will be disengaged by an adjustable lug on the corresponding side and end of the quadrant, and will thus allow the pinion to stop, though the shaft continues to run. Both ratchets may be instantly disengaged by hand, and the position of the nozzles be regulated by a hand lever when starting up, or in case of accident to belts or of decrease in head of water.

To start the plant the governor ratchets are first disengaged and the exciter is brought to a moderate speed; the generator is then started and its field is charged; it is then brought to about three-fourths of its full speed, and the exciter is then slowly increased until the cross-bar on the governor cease to move. At this moment the ratchets are thrown in, and the governor takes charge of the generator speed. The speed of the exciter is now slowly increased to its full value, which of course brings the generator to full speed.

The speed of the exciter-wheel is regulated by a small throttle-valve, the changes in the position of which do not have any noticeable effect on the pressure in the pipe, owing to the small size of the jet controlled. This valve is so made as to have an equal pressure on each side of its axis when partly open, and hence can be moved from one position to another with little effort, which makes it of special value for use with automatic governors. When tightly closed, however, the areas subjected to pressure are no longer equal, and the valve sticks tightly.

An effort was made to automatically govern the exciter by means of a ball governor driven by a belt from the exciter-wheel shaft and actuating the valve by means of two leather friction-cones acting alternately on a beveled disk geared to the valve, but this proved unsatisfactory and was finally discarded, chiefly on account of the difficulty of maintaining the proper adjustment, by reason of the wearing away of the cones and of their swelling from dampness. The exciter was therefore controlled directly by hand for a long time. At present the valve is worked from a distance by a simple electrical arrangement devised by Mr. Imlay, in which advantage is taken of the fact that when the exciter is at full speed the movements of the valve necessary to regulate the speed are small.

The device consists essentially of two fixed solenoids in series, energized by current from the exciter and normally acting with equal force on two iron cores supported respectively at the opposite ends of a walking beam connected by levers to the valve, their normal function being to keep the valve stationary. Either of the coils may be short-circuited at will by means of a relay controlled by two keys and likewise actuated by current from the exciter. When either coil is short-circuited it ceases to hold its core, and the core on the other end of the walking-beam is pulled down by its own coil, thereby turning the valve in a corresponding direction. In order that this movement may not be too rapid the coils and cores are immersed in oil, which causes the coils to act as dashpots to the cores; by this means the movement of the valve may be made as slight as is desired.

The relay is not really necessary, but was used to break the circuit in experiments made before the plan of short-circuiting one coil was devised, and has been retained because very convenient. A momentary closing of either key suffices to correct any change of speed, such changes being indicated by the compensating voltmeter. The current in the coils is reduced by a resistance in series with them about equal to that of one coil, and the current for the relay is shunted from the resistance at about two volts. The current normally passing through the coils and resistance is about two amperes at 100 volts (about ¼ H. P.) and when one coil is short-circuited the current in the other increases to three amperes, so that the maximum power used is ⅜ H. P.

(*To be continued.*)

BOOK REVIEWS.

ELECTRICAL BOATS AND NAVIGATION. By THOMAS COMMERFORD MARTIN and JOSEPH SACHS. 220 pp., 8vo. New York: C. C. Shelley. Price $2.50.

Mr. Martin seems to have the faculty of getting hold of a subject and publishing a book upon it while others are only just taking up its study. In this way he becomes a pioneer authority on that subject, and by his early works materially assists those who come after. Thus in the street railway motor, associated with Mr. Wetzler, he gave the world the first connected and exhaustive account of its development and application. In the present volume, ably assisted by Mr. Sachs, he has given the world the first systematic treatment of the motor as applied to the propulsion of boats, and this bids fair to occupy the same position as regards boat propulsion as his earlier work on Street Railway Motors has so long occupied in the literature of street car propulsion.

The book is handsomely printed on heavy tinted paper and abundantly illustrated. Its general scope is best indicated by the various chapter headings which are as follows: I, Electrical Boats: Historical and Introductory; Primary Battery Boats. II, Storage Battery Boats: Preliminary; Single Launches. III, Storage Launch Fleets and Passenger Boats. IV, Special Features of Storage-Launch Operation and Charging. V, Special Electrical Craft, Rowboats, Catamarans and Paddle-wheel Boats. VI, Submarine Electric Torpedo Boats. VII, Dirigible Electric "Torpedoes" for Warfare and Life Saving. VIII, Some General Considerations on Electric Launch Requirements. IX, Canal Boat Propulsion: Historical—Erie Canal. X, Conditions Entering into Canal Boat Propulsion. XI, Methods of Applying Electricity to Canal Boat Propulsion—Boats Equipped with Motors. XII, Methods of Electric Canal Boat Propulsion with Motor Exterior to Boat. XIII, Generating Plant and Distribution. XIV, Resistance of Canal Boats—Comparison of Cost Propeller vs. Hauler. XV, Propulsion: Resistance of Boats and Propellers: Paddle-wheels and Screws. XVI, Miscellaneous Uses of Electrical Power. XVII, Storage Batteries, Meters and Dynamos.

"THE ELECTRICIAN" ELECTRICAL TRADES DIRECTORY AND HANDBOOK FOR 1895, with Biographical Notes. 8vo, 907-120 pp. London: "The Electrician" Printing and Publishing Co., Ltd. Price, 7s. 6d.

This, the thirteenth edition of the Directory comes to us as an old friend in a considerably enlarged and somewhat improved form. The general plan of this work has been to divide the immense mass of material collected under three main divisions, viz., the Handbook, the Directory and the Biographical. Under the Handbook division is given much that is of use to electricians everywhere, such as reference tables, etc., etc. The Directory is divided into two parts: the first giving an alphabetical list of some 7,500 names of companies, firms and individuals directly identified with the electrical interests of Great Britain, and the second giving a similar list of names of those identified with the electrical interests of Colonial, Continental and American countries. Evidently great care has been observed in the selection of these names, and we are particularly pleased with the fullness displayed in that portion devoted to American electricians and electrical business enterprises.

The last division of the Directory—the Biographical—while of great value is the least satisfactory portion of the book. It contains sketches of the lives of 269 men who have been selected by reason of their real or supposed prominence in the electrical world. These sketches are usually exceedingly well written, and have already proved of great interest and value to users of the book, but it is in the selection of the names to be thus especially honored that the difficulty is bound to arise. We notice many sins both of omission and commission. For instance, in looking for a sketch of Helmholtz, we are surprised beyond measure to find his name unmentioned. Turning to the Directory, we also find it absent there, yet Helmholtz was one which almost beyond any other name electricians have delighted to claim as one of their number. On the other hand, there are undoubtedly some names mentioned that do not deserve to be placed in such good company as they are found in if the test of fitness is either prominence or breadth of accomplishments.

ARMATURE WINDINGS OF ELECTRIC MACHINES. By H. F. PAPSHALL and H. M. HOBART, S. B. Quarto, 368 pp., 140 full-page plates, 65 tables. New York: D. Van Nostrand Company. London: Robert W. Blackwell. Price, $7.50.

This admirable work is the outcome of the very extended practice of the authors in the practical designing of dynamo electric machines, and is unique not only in the exhaustiveness and comprehensiveness of the treatise, but in its method of treatment. As to the scope of the work, the table of contents will be the best index. It is divided into fourteen chapters, as follows: Chapter I, Single-Wound Gramme Rings; II, Double-Wound Gramme Rings; III, Two Circuit Single-Wound Multipolar Rings; IV, Two Circuit Multiple-Wound Multipolar Rings; V, Bipolar Drum Windings; VI, Multiple-Circuit Single-Wound, Multipolar Drums; VII, Multiple Circuit Multiple-Wound Multipolar Drums; IX, Interpolation of Commutator Segments; X. Two-Circuit Multiple-Wound Drum Armature; XI, Rules and Tables Continuous Current Windings; XII, Single-Phase Alternating Current Windings; XIII, Quarter-Phase Alternating Current Windings; XIV, Three-Phase Alternating Current Windings.

The method of treatment is in general as follows: The left-hand page is given to a large scale diagram of the particular method of winding, while on the page facing the diagram are given the reasons why the method is good or bad. The diagrams are so large and so excellently executed as to be easily followed, and the text is so brief, and yet pointed, as to leave no cause for confusion or ambiguity. It will thus be seen that in method of treatment a very radical departure has been made, and we think the value of the work as a work of reference, or as a catalogue of illustrated object lessons, has been greatly increased by this departure.

The publishers, too, are deserving of the highest praise for the admirable way in which they have done their part of the work. We heartily commend this book to every one having to do with dynamo designing, as most admirably supplementing the works of Thompson and others in which pure theory is more fully developed.

AMERICAN STREET RAILWAY DECISIONS. A Collection of All Reported Cases Decided in the Various Courts within the United States and Canada; chronologically arranged. Vol. 2. Edited by CHARLES A. RICHARDSON and ANDREW J. HOOK. Published by the American Street Railway Association, 1894.

This book, which comprises 483 pages of the usual legal size, is found to very fully satisfy its title and subtitle. It is the official publication of the American Street Railway Association, and as such will be regarded with entire confidence by those into whose hands it comes. The references are usually short and pithy, but in cases that have warranted fuller treatment it has been generously accorded.

American street railway law has of late years assumed an importance not warranted in the days of horse and mule traction, and with the extension of the electrical and cable systems, which have given rise to grave questions not formerly raised except by vehicles directly propelled by steam, the necessity for compilations of this kind has rapidly increased, until now they find their place in the library of every street railway company in the country. The work under review is well printed and strongly bound in sheep, and will be found very useful for reference by all those interested in the subject of street railway franchises.

The Nassau Franchise.

The General Term of the Supreme Court has handed down a unanimous decision in Brooklyn in favor of the Nassau Electric Railroad Company in its appeal from the decision of Justice Walter L. Smith, who had declared the franchise null and void on the ground that the Aldermen had not done their duty in declining an offer for the same franchise from another company which offered more. Mr. E. M. Grout, who originally brought the action, will carry the case to the Court of Appeals.

Personal.

Mr. Robert B. Corey has lately returned from a successful trip through the West, having been as far as Denver.

Mr. C. P. Mackie, late of the Electric Selector and Signal Company, has written for the *Evening Post* two very interesting articles describing the failure of a recent attempt to colonize a number of Georgia negroes in Mexico.

Col. Brian, of Washington, was seen driving down Broadway in a victoria a few nights ago, looking for the Electric Club.

Mr. J. Holt Gates, of Chicago, was in New York last week perfecting new business arrangements.

Among the out of town delegation in the metropolis last week were Mr. Chas. Huntley, of Buffalo, and Mr. S. M. Hamill, of Cleveland.

A sportsman reports from Calcutta that he uses the electric light in hunting tigers at night. He sits on a raised platform in the jungle and suspends a 5 C. P. incandescent lamp over the bait, which is placed about 30 feet away. Batteries supply current for the light. A switch on the hunter's rifle enables him to throw on the light when he is ready to shoot. The light tends to temporarily blind the tiger, and a good shot can be had before his eyes become accustomed to it.—*Electrical Engineer* (London).

General News.

What is Going on in the Electrical World.

Woodstock, N. Y.—The building of an electric road in the town of Woodstock is contemplated.

Perry, Ok.—The electric light plant was put into operation by the company for the first time on the 20th.

Des Moines, Iowa.—The city council has decided to double the capacity of the city electric light plant at a cost of $7,000.

Montevallo, Ala.—The people of this place are talking in favor of establishing an electric light plant and waterworks.

Chico, Cal.—The town trustees have granted a franchise to H. H. Clark, of San Jose, for an electric light and power plant for Chico.

Baltimore, Md.—The South Eutaw branch of the Baltimore passenger system is to be equipped with electricity and operated as a trolley line.

Springfield, Mass.—The formal opening of the new electric line to Holyoke took place last week. Cars are run on a fifteen minute schedule.

Fort Madison, Ia.—The contracts have been all let for the equipment of the street car line with electricity. The Westinghouse motor will be used.

Bainbridge, Mass.—An electric light company is about to be formed here to supply electric lights to the village if enough stock can be raised.

Adrian, Mich.—This city will probably purchase the lighting plant of J. H. Fee & Son, as the mayor has advised the city council to negotiate for it.

Southbridge, Mass.—The promoters of the Southbridge and Fiskdale Electric Street Railway have voted to increase the capital stock from $35,000 to $60,000.

Brookhaven, Miss.—The Brookhaven Manufacturing and Improvement Company have been granted a franchise to establish an electric light system in this city.

Ogdensburg, N. Y.—The Ogdensburg Street Railway Company have increased their capital stock from $75,000 to $150,000, and will convert their line into a trolley system.

Milford, Del.—An electric railway is projected to connect this town with Dover. Permission has been granted the company to lay its tracks and operate its cars.

Seattle, Wash.—The Rainier Avenue Electric Railway has been sold at sheriff's sale to Frank H. Osgood, of the Seattle National Bank. The price paid was $14,300

Quebec, Can.—The contract between Quebec City and H. J. Beemer for the construction of the electric railway has been signed. Work will be commenced at once.

Cincinnati, O.—The Martin Cable Street Railway Company have applied for permission to change the motive power on a part of their road from cable to electricity.

Sturgeon, Mo.—There is talk of building an electric line from Sturgeon to Columbia, the county seat. Several prominent citizens are interested in the matter.

Kalamazoo, Mich.—The city electric light plant was sold under foreclosure proceedings on the 17th inst. to James Munroe, acting for Leroy Cahill, who had a mortgage on the property for $30,000.

Hot Springs, Ark.—Parties having in view the building of an electric road from this city to the Ouachita River have been looking over the ground lately and have, it is reported, decided to begin the work.

Mount Holly, N. J.—The new trolley line of the Pennsylvania Railroad between Burlington and Mount Holly was formally opened to the public on the 22d inst. and scored a big success in mechanical operation and speed.

Millbury, Mass.—Representatives of the Blackstone Valley electric road have been canvassing the towns along the proposed route and have met with much encouragement. Franchises have been applied for at Grafton and Sutton.

Albany, N. Y.—The Railroad Commissioners have granted the Cohoes City Railway Company permission to use the trolley system on their road. The application of the Utica and Herkimer Street Railroad will be considered August 6.

St. Augustine, Fla.—Judge Hammond of Orlando, T. H. Packwood of Maitland, and Thomas J. Appleyard of Sanford, Fla., propose to build an electric railway here if the board of aldermen will grant them a desirable franchise.

Butte, Mont.—The first electric hoist to be placed in the mines of Butte was installed a few days ago at the Virginius, and it is more than probable that the installation will mark a new departure in the working of the mines in this vicinity.

Westfield, N. Y.—There is a possibility that an electric railroad will be built between Chautauqua and Barcelona on Lake Erie. William L. Minton has secured options on territory between the two places and something is expected to result.

Brunswick, Ga.—Col. W. A. Jeter, of Macon, has applied to the city council of Brunswick for a franchise for an electric railway in that city and neighborhood, the entire line to be about fifty miles long and to carry freight as well as passengers.

Shelburne Falls, Mass.—A committee consisting of Rufus Covell, Herbert Newell and George H. Wilkins have been appointed by the board of trade to investigate the matter of electric lighting and report as to the estimated cost of a suitable plant.

Erie, Pa.—The project of building an electric railway from Erie to North East and then continuing the line along the lake shore to Buffalo is receiving considerable attention from the newspapers in the section through which the road is to run if built.

Memphis, Tenn.—The Memphis Street Railway Company has applied to the city council for permission to purchase all the lines, equipments, franchises, etc., of the Citizens' Street Railway Company and the lines controlled and operated by that company.

Cleveland, O.—Rapid progress is being made in laying the rails of the Akron, Bedford and Cleveland Electric Railway. The work upon the line is being pushed with the view of having the cars in operation between Akron and Cleveland about the first of September.

St. Joseph, Mich.—The St. Joseph and Lake Shore street railroad has been sold at execution sale to the St. Joseph and Benton Harbor Electric Street Railway Company for $306 above the many judgments. There are three miles of the road and it will be equipped with electricity.

Rochester, N. Y.—The Glen Haven Railroad, which is to be sold under foreclosure of the first mortgage bonds about the first of September, will probably be bought in by the bondholders, in which event the road will be made standard gauge and equipped with electricity.

Knoxville, Tenn.—The Knoxville Street Railway has been sold, under foreclosure proceedings, for $162,152. The property was purchased by J. Simpson Africa and C. C. Howell as representatives of the bondholders. The road will be improved, extended and placed on a paying basis.

Niagara Falls.—It is stated that the Michigan Central Railway Company has placed an order with the General Electric Company at Schenectady for two powerful searchlights with which to illuminate the falls. Slides will be arranged so as to throw lights of various colors upon the tumbling waters.

Brooklyn, N. Y.—All the necessary preliminaries for the legal incorporation of the Kings, Queens and Suffolk Railroad Company have been completed. The company was formed to construct and operate a bicycle railroad on Long Island.—Proposals will be received for furnishing 100 miles of insulated hard-drawn copper telegraph wire for the Brooklyn Fire Department. F. W. Wurster, commissioner, can be addressed for information.

Connersville, Ind.—The city council has approved the report of a special committee advising the purchase of a municipal lighting plant. The Western Electric Company has offered to put in a new plant for $12,260. The present lighting contract expires in a few weeks.

Santa Barbara, Cal.—The stock subscriptions to the Santa Barbara Electric Railway amount to $70,000, and the company expects to begin operations at once. The officers of the road are: President, A. Hope Dueg, Santa Barbara; vice-president, S. J. Keese, Los Angeles; secretary and treasurer, N. F. Ashton; manager, W. F. Reed.

Washington, D. C.—Proposals will be received at the office of the Architect, United States Capitol, until 12 o'clock noon August 3 for electric lighting material. Schedule and other information will be furnished on application to Edward Clark, Architect U. S. Capitol. The right is reserved to reject any or all bids.

Hartford, Conn.—The Perkins Electric Switch Company of this city has increased its capital from $50,000 to $125,000. The new capital was paid in as follows: C. G. Perkins, $40,000; Roland Mather, $15,000; Edward W. Hooker, $5,000; J. M. Allen, $2,500; James Nichols, $2,500; E. C. Frisbie, $5,000; P. H. Woodward, $2,000; Talcott Brothers, Talcottville, $3,000.

New York.—The managers of the Eighth Avenue horse car line have decided to change their motive power to electricity, and will use the Westinghouse underground electric railway system, which has lately aroused much interest among street railway men. The managers of the Sixth Avenue surface road are also considering the advisability of a similar change.

Pittsburg, Pa.—A charter has been granted to the Consolidated Traction Company of Pittsburg, an organization resulting from the amalgamation of the Central, Duquesne, Pittsburg and Citizens' lines, that is, all or nearly all the street railway lines of Pittsburg. The capital stock of the new company is $15,000,000. The directors are: C. L. Magee, George W. Elkins, George I. Whitney, William Flinn and George Sheppard.

Indianapolis, Ind.—The projectors of the Indianapolis, Franklin and Greenwood electric railway are making investigations preliminary to starting the construction work on the road. The Toledo Construction Company, represented by W. S. and C. E. Coon, is prepared to begin the work as soon as it is found that the promoters of the scheme have a good franchise and the company is legally incorporated.

Sacramento, Cal.—The transmission of electrical energy from the works of the Sacramento Electric Power and Light Company at Folsom to this city, a distance of twenty-two miles, is an accomplished fact. A salute of 100 guns announced the opening The power is now effectively running street cars and will, as soon as possible, be employed in operating mills, factories, etc., as well as in furnishing light for the citizens. The engineers state that the loss in transmission is about 10 per cent.

Homestead, Pa.—The Carnegie Steel Company on Thursday last tested a new plan which Manager Schwab and Chief Electrician Kinley have evolved for reheating molten metal that has become chilled before it can be poured into the moulds, causing delay and loss The new plan largely consists in forcing into the mass an electric current, by which an intense heat is generated. The experiment was largely successful and the new method promises to become indispensable in the manufacture of steel.

Worcester, Mass.—The *Gazette* says: "A new industry has just been started in the city and is known as the Worcester Electro Marbleizing Company. This is an entirely new process for imitating marble-onyx on all kinds of metals by electroplating. The variety of color shades in light and dark that can be produced are almost unlimited. The projectors of this new enterprise are G. L. Feldman, of Newark, N. J., president; A. B. Brunnell, the well-known electrotyper of this city, treasurer, and B. F. Pierson, of New York, secretary."

Boston, Mass.—Superintendent of Lamps James Buckner has devised a pole for sustaining electric wires which is so insulated as to protect employees and other people from accidents. The pole has been subjected to a number of tests which it stood successfully, and the only question is whether the insulation (a discovery of Mr. Buckner's) is durable under the variations of weather that would assail it.—The Lowell and Suburban Street Railway Company have made application to the Railroad Commissioners for their approval of an issue of $400,000 stock by the company for the purpose of reconstruction and equipment with electricity.

Auburn, N. Y.—The Auburn Inter-Urban Railroad Company, recently organized with a capital stock of $250,000, proposes to construct an electric road from Island Park, at the foot of the lake, through to this city and thence to Skaneateles and Port Byron. The incorporators are: Edwin F. Voris, George C. Kobler, N. P. Goodhue, Wilson H. Pixley, Charles Dietz, L. S. Ebright, of Akron, O.; J. J. Smith, of Cincinnati, O.; P. M. Herron, Charles P. Mosher, George W. Elliott, Daniel L. Ramsey, George Underwood, S. E. Bell, George B. Turner and H. V. S. Lord, of this city.

Los Angeles, Cal.—The Kern River and Los Angeles Electric Power Company, lately organized, proposes to utilize the cascades of the Kern River at Bakersfield in generating electricity for transmission to Los Angeles and neighborhood. The distance is from 100 to 120 miles. The board of directors of the company is composed as follows: L. J. C. Spruance, Chicago; H. S. McKee, New York; J. W. Eddy and E. H. Gale, Aurora, Ill.; E. H. Brooks, Grand Rapids, Mich.; John Ross, O. W. Childs and W. H. Davis of Los Angeles; P. J. Beveridge of Hollywood, Cal.; E. H. James, Paso Robles, Cal., and C. J. Taylor, Kernville, Cal. The principal office of the company is in Los Angeles and the capitalization is $5,000,000.

Fresno, Cal.—The San Joaquin Electric Company has let contracts for supplying electric machinery, wire, insulators, water-wheel plant, etc., and work is being pushed in its big transmission scheme. A mile of the big ditch carrying the water from the north fork of the San Joaquin River to the great reservoir is now completed and work on the reservoir is well under way. Machinery to generate one-fourth of the power will be put in as soon as possible at a cost of about $200,000. The total power that can be generated is about 8,000 H. P. The company has decided to build a sub-station in this city, and this will be the distributing point for the mills, factories, car lines, etc., and for the vineyards within a radius of six or eight miles.

Toledo, O.—The Toledo Traction Company have closed contracts for new generators and engines and intend to make such improvements in their street railway as will make the entire system superior in every respect. A unique feature of the plant will be the consolidation of power by which the same set of engines will run generators of a current for eighty miles of single track railway, for lighting the streets and for stationary power.—Mr. Replogle has invented a wheel which furnishes its own motive power. This it does by means of an electrical generator affixed to the hub, which once the wheel is set in motion furnishes the power to keep it going. Mr. Replogle proposes to apply the wheel to a bicycle and use it as the chief feature in the characteristics of a new machine that he will put on the market in the near future.

Philadelphia, Pa.—The People's Traction, the Electric Traction and the Philadelphia Traction companies have been consolidated and a new company formed from the combination to be known as the Union Traction Company. The new corporation has deposited $3,000,000 in cash, 10 per cent of its capital stock, as required by the corporation law, and has received its charter from Harrisburg. Its capital stock is $30,000,000 and J. Lowber Welsh is to be the president. The application for the charter was signed by the following men, who are to form the first board of directors: John Lowber Welsh, Wm. H. Shelmerdine and Caleb F. Fox, of the People's Traction Company; P. A. B. Widener, Wm. L. Elkins, James McManus, Joseph B. Altemus and Thomas Dolan, of the Philadelphia Traction Company; Jeremiah J. Sullivan, Alexander M. Fox and Alfred Smith, of the Electric Traction Company.

Chicago.—At the recent meeting of the Northwestern Electrical Association a part of the president's address was devoted to a eulogium on Ex-president H. C. Thom, who died recently.—The *Times-Herald* says: "An electrical plant for the manufacture of phosphorus has been established at Grand Crossing. It is now a modest affair, but it is the result of a number of years of experimenting, and the promoters say the method of manufacture they have discovered is so cheap they will be able to control the phosphorus market. At present there are but three active phosphorus plants in the world, one in the United States and two in Europe. The Chicago company will make the fourth. The annual output of phosphorus is estimated at 50,000,000 pounds. At an average wholesale price of 50 cents per pound, the value of the product will reach $25,000,000."—The Clark street trolley ordinance has been passed over the mayor's veto.

The Clark Arc Lamp.

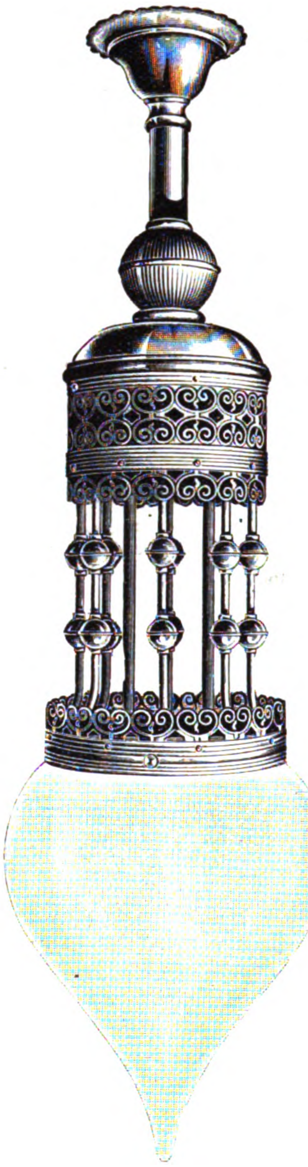
The Clark Arc Lamp is no less favorably known to the electrical fraternity than other forms of arc lighting apparatus manufactured by the Clark Electric Company, 478 and 480 Pearl street, New York.

The accompanying illustration shows a type of ornamental lamp designed for interior lighting of private parlors, banks, stores, offices, hotels, theaters, etc. This lamp can be used on arc, alternating or continuous incandescent circuits, and burned either in series or singly. The illumination is white, perfectly steady and as agreeable to the eye as daylight, and will produce, for the same cost, sixteen times as much illumination as gas or incandescent light.

Many of these lamps are used by some of the most prominent corporations, firms, institutions and individuals in New York City and elsewhere, and have given perfect satisfaction.

"Americans Abroad."

The Canadian branch of their business having been established, the Bryan-Marsh Company intend "carrying coals to New Castle" by arranging for a permanent London house for the sale of their incandescent lamps abroad. This has been the natural result of an increasing demand for their product, originating from the sale of their high efficiency Lamps that have met with such a favorable reception in Europe One good thing always sells another, and so a general demand has been created for all the types of lamp manufactured by this enterprising firm.



THE CLARK ORNAMETAL LAMP.

The business depression of the last two years having made necessary new economies in American manufacture to keep up with the gradual fall of prices, a general benefit has resulted in the shape of improved mechanical appliances that have not only lessened the cost of production, but what is far more important, have raised the standard of excellence so that buyers now feel that lamps so made approximate perfection in the present types of incandescent lamps. As this much-desired condition cannot be obtained by the old-fashioned methods in use abroad, the natural result is that the more reliable American product will obtain a strong foreign foothold, especially with shrewd buyers.

The Pittsburg Trolley Pole Company, with increased manufacturing facilities, is operating full time to keep pace with orders.

COMMERCIAL PARAGRAPHS.

There isn't much need for snow sweepers or snow plows these days, but it is a good time to think about them. The McGuire Manufacturing Company, Chicago, has issued a circular that will be of much service to those who think of buying snow plows or sweepers.

Wm. H. Hornberger, formerly of the Hornberger Electric Company, of Elkhart, Ind., is now with the "Vindex" Electric Company, Sycamore, Ill., and is about to place a new type of transformer on the market.

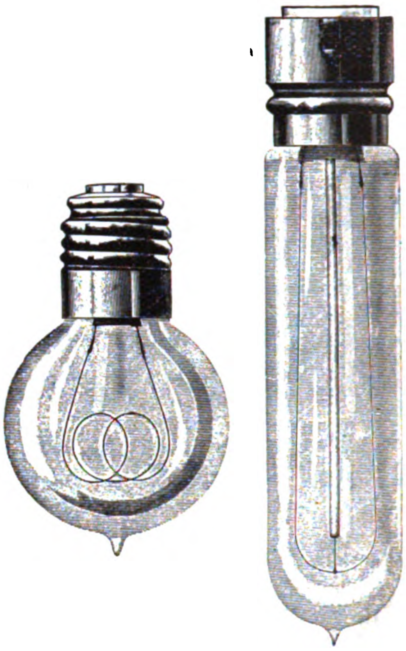
H. B. Coho & Co., the well-known electrical engineers of 208 Broadway, have become the New York agents for the Eddy Electric Manufacturing Company, Windsor, Conn.

Special Buckeye Lamps.

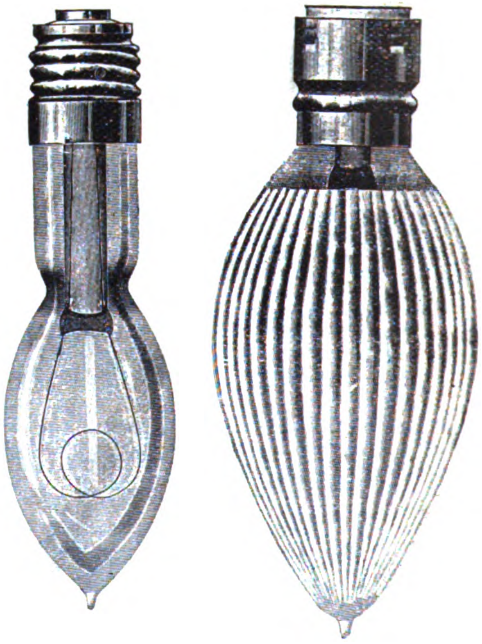
The accompanying illustrations show some of the special lamps now being made by the Buckeye Electric Company, Cleveland, O. Cut No. 1 shows the "Imperial" Decorative Lamp. This lamp is made for voltages from 48 to 130 and in 8 and 16 C. P. sizes. The globes are either plain or frosted or dipped in blue, green, ruby or amber colors.

Lamp No. 2 is especially adapted for use in breweries and distilleries and has been christened the "Bunghole" Lamp. It is made for low and high voltages, in 10 and 16 C. P. sizes, and with frosted, opal or plain globes.

A "Long Flame Candle" Lamp is shown in cut No. 3.



BUCKEYE LAMPS—NOS. 1 AND 2.



BUCKEYE LAMPS—NOS. 3 AND 4.

This is for ornamental purposes and is made for low voltages with plain, opal or frosted globes.

In cut No. 4 is shown the "Pineapple" Ornamental Lamp, made for voltages from 48 to 130, in 8 and 16 C. P. sizes, and in plain or frosted globes. All these lamps are fitted with any desired base.

INCORPORATIONS.

The Northwest Construction Company, Portland, Ore.—to build, construct and equip railroads, electric-car lines or roads, telephone and telegraph lines, and to contract for the construction of the same and for their maintenance and operation. Capital stock, $1,000,000. Incorporators: George Taylor, T. H. Curtis and F. R. Strong.

The Iron River Electric Light, Power and Telephone Company, Iron River, Wis. Capital stock, $20,000. Incorporators: Warne S. Carr, Byron Ripley and O. H. Campb ll.

The Fort Pitt Traction Company of Pittsburg, Pa. Capital stock, $500,000. Directors: Joshua Rhodes and Wm. B. Rhodes, of Allegheny; C. L. Magee and Robert S. Frazier, of Pittsburg, and Wm. C. O'Reilly, of Crafton.

The Solar Electric Company, New York, N. Y.—to make and sell electrical appliances. Capital stock, $100,000. Promoters: Hewitt Boice, Jacob R ce, King ton, N. Y.; Samuel O'Connor, Brooklyn, N. Y.

The LaBurt Electric Railway Company, New York City—to conduct, operate and maintain inventions, letters patent, etc., improvements in the mechanical arts, electrical and other science, etc. Capital stock, $3,000,000. Promoters: John LaBurt, Brooklyn, N. Y.; Louis Michaelis, Alex. M. Lowery, New York City; Irving Hull, Bridgeport, Conn. (Incorporated in W. Virginia.)

The Bullard Electric Company, Chicago, Ill.—to manufacture, buy, sell and deal in electrical apparatus, machinery, supplies and fixtures of all kinds. Capital stock, $25,000. Promoters: Charles W. Bullard, Auburt S. Bullard, Carl E. Kammeyer.

The Cape May Court House Light, Heat and Power Company, Cape May C. H., N. J.—to manufacture, generate, store and deal in electricity. Capital stock, $25,000. Promoters: Alex. R. Springer, Cape May C. H.; Howard Bucknell, Walter W. Hartel, Philadelphia.

The Yankton General Electric Company, Yankton, S. D.—to establish and operate general electric light plants. Capital stock, $50.000. Promoters: A. T. Nation, Bedford, England; Harry Eller, H. G. B. Swinhoe, Yankton.

The Kansas and Missouri Electric Railway Company, Pittsburg, Kan.—to construct and operate a line of railway in Crawford County, using either steam or electric power. Capital stock, $25,000. Directors: Sam Barrett, Robert Robyn and A. L. Chapin, of Pittsburg, Kan.; Robert Simons, of West Chester, Pa.; L M. Bedell, C. J. Simons and Harry W. Bedell, of Chetopa.

The Citizens' Electric Company, Plainfield, N. J.—to build, construct and maintain electric machinery, implements, appurtenances and plants for distributing light, heat and power. Capital stock, $50,000. Promoters: Harry G. Runkle, Elias R. Pope, James C. Pope, Plainfield, N. J.

The Electric Wire Hanging Insulator Company, Chicago, Ill.—to manufacture, sell and deal in insulators, clamps and hangers for all classes of electrical work. Capital stock, $200,000. Promoters: Edgar O. Baker, Wm. A. Robertson, Henry W. Rice.

The Iron Mountain Railway Company, San Francisco, Cal.—to build, construct and equip a railroad from the Iron Mountain mines to Spring Creek Crossing, on the California and Oregon Railroad, to be operated by steam, electricity or other motive power. Capital stock, $100,000. Promoters: Louis B. Parrott, Chas. P. Eells, M. M. O'Shaughnessy, San Francisco; Alfred Fellows, Newcastle-on-Tyne, Eng.; Chas. W. Fielding, London, Eng.

The Pocatello Power and Irrigation Company, Chicago, Ill.—to operate water power plants; generate electricity for use in producing light, power and mechanical purposes; operate telephones and furnish water for irrigation and domestic purposes. Capital stock, $150,000. Promoters: Charles W. Spalding, Daniel Swinehart, Francis W. Smith.

The Jasper County Telephone Company, Rensselaer, Ind.—to operate a telephone system in Jasper, Newton, Benton, Porter, Lake White, Pulaski, Stark, Laporte and Tippecanoe counties, Ind. Capital stock, $8,000. Incorporators: James T. Watson, C. C. Sigler, E. L. Hollings and Delos Thompson, all of Rensselaer.

The Memphis Telephone Company, Memphis, Tenn. Incorporators: J. T. Jefferson, J. C. Neely, Fred Orgill, E. G. Robinson and J. C. Neely, Jr.

The Western Electric Telephone Company, Britt, Ia.—to operate telephone exchanges in Hancock, Cerro Gordo, Kossuth and other counties. Capital stock, $100 000. Incorporators: Charles Webster, T. A. Potter and J. T. Carr.

The Detroit Harrison Telephone Company, Detroit, Mich. Capital stock, $600,000. Incorporators: Chas. P. Collins, O. W. Shipman, Chas. Flower, R. A. Brett, Wm. E. Holmes, Albert Peck, Frank D. Andrus and C. B. Hubbard.

The Sacramento, Fair Oaks and Orange Vale Railway Company, Sacramento, Cal.—to construct, own and operate a railway from Sacramento to Orange Vale, by steam, electricity, compressed air or any other motive power. Capital stock, $500,000. Promoters: L. T. Hatfield, Thos. B. Hall, Fred'k Cox, Wm. Schaw, Geo. M. Mott, Sacramento.

The Commercial Telephone Company, Alameda, Cal.—to operate telephone system. Capital stock. $100,000. Incorporators: S. P. Lunt, E. R. Smith, John W. Butler, Albert L. Stetson and J. D. Johnson.

The Atlantic City Telegraph and Telephone Company—to operate telegraph and telephone lines in all the cities and villages of New Jersey. Capital stock, $25,000. Incorporators: John J. McCloskey, Charles A. Furbush, James Brown, Peter Ballingall, Daniel McCormick, William Martin and Ulysses G. Styron of Philadelphia.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED JULY 16-23, 1895.

ELECTRIC RAILWAYS AND APPLIANCES.

543,042. Trolley-Wheel. Charles Mitchell, Yonkers, N. Y., assignor of five-eighths to Harry A. Archibald, same place. Filed Dec. 20, 1894

5 3,180. Underground-Trolley System. Noel B. Ginochio, New York, N. Y., and Henry C. Bridger, Woodbridge, N. J. Filed Dec. 27, 1894.

543,271. Trolley Stand and Pole. Lawrence C Seelye, Fort Edward, assignor of one-half to George W. Burnham, Luzerne, N. Y. Filed Jan. 2, 1895.

543,351. Electric Brake. William B. Potter, Schenectady, N. Y., assignor to the General Electric Company of New York. Filed March 28, 1895.

543,352. Safety Appliance for Electric Cars. William B. Potter, Schenectady, N. Y., assignor to the General Electric Company, of New York. Filed April 9, 1895.

543 382. Electric Railway System. John C. Henry, Westfield, N. J. Filed May 13, 1895

543,435. Means for Arresting Motion of Electric Cars. Arthur K. Bonta, Hoboken, N. J., assignor to the Bonta Manufacturing Company, same place. Filed March 21, 1895.

542,617. Running-Gear for Electric Railways. Bion J. Arnold, Chicago, Ill, assignor to the Thomson-Houston Electric Company of Connecticut. Filed April 13, 1891.

ELECTRIC LIGHTS AND APPLIANCES.

542,625. Carbon for Electric Lamps. Henry F. Cabrau, Paris, France. Filed April 11, 1895.

542,6 2. Electric-Arc Lamp. Elihu Thomson, Swampscott, and Charles E. Harthan, Lynn, Mass., assignors to the General Electric Company, Schenectady, N. Y. Filed June 25, 1894.

542,982. Producing Pure Electric-Light Carbon. Edward G. Acheson, Monongahela City, Pa. Filed Aug. 25, 1894.

543,016. Incandescent-Lamp Socket. Edgar H. Heath, Grand Rapids, Mich., assignor of one-half to John H. Beamer, same place. Filed March 21, 1895.

543,186. Carbon-Holder. John C. Knight, New York, N. Y. Filed Jan. 15, 1895.

43,213. Electric-Arc Lamp. Daniel Higham Boston, Mass. Filed May 2, 1895.

543,28 . Incandescent Electric Lamp. George Westinghouse, Jr., Pittsburg, Pa. Filed Aug. 29, 1892.

543 355. Electric-Arc Lamp. Henry J. Sage, Chicago, Ill. Filed Feb. 13. 1 95.

543, 99. Electric-Arc Lamp. Samuel R. Nutting, Oak Park, assignor to George W. Furbeck and Joseph Kettlestrings, Chicago, Ill. Filed Oct. 5, 1894.

543,445. Electric-Arc Lamp. William Jandus, Cleveland, Ohio. Filed Dec. 19, 1894.

DYNAMO ELECTRIC MACHINERY.

542,667. Regulation of Continuous-Current Motors. Merle J. Wightman, Scranton, Pa., assignor to the General Electric Company of New York. Filed April 2, 1895.

543,021. Dynamo-Electric Machine. Thomas Hooker, Syracuse, N. Y. Filed April 26, 1894.

543,223. Alternating Electric Motor. Joseph A. G Trudeau, Ottawa, Canada. Filed April 6, 1894.

54 ,346. Electric Transformer. John A. Mosher, Chicago, Ill. Filed May 7, 1895.

543,383. Dynamo-Electric Machine. Thomas H. Hicks, Detroit, Mich. Filed Jan. 13, 1891.

BATTERIES.

542,953. Elements of Galvanic Batteries. Franz A. von Allmonda and Nino von Allmonda, Castello Allmonda, near S grado, Austria-Hungary. Filed Oct. 20, 1894.

543,372. Secondary Battery. Emil Boettcher, Leipsic, Germany. Filed May 12, 18"0.

TELEPHONE AND TELEGRAPH APPARATUS.

542,618. Telephone Relay or Repeater. Chester H. Arnold, Boston, Mass., assignor to the American Bell Telephone Company, same place. Filed March 16, 1895.

542,619. Telephonic Repeating Circuit and Apparatus. Chester H. Arnold, Boston, Mass., assignor to the American Bell Telephone Company, same place. Filed March 16, 1895.

542,657. Telephone Relay Apparatus. Wilton L. Richards, Malden, assignor to the American Bell Telephone Company, Boston, Mass. Filed March 16, 1895.

542,658. Telephone Repeating-Circuit and Appliances. Wilton L. Richards, Malden, assignor to the American Bell Telephone Company, Boston, Mass. Filed March 16, 1895.

542,6 9. Coin-Controlled Telephone. Charles B. Hopkins and Thomas H. Elsom, Spokane, Wash. Filed March 16, 1894.

542,822. Microphone. Henri Carboncile, Brussels, Belgium. Filed Oct. 9, 1894.

542,918. Telephonic Relay or Repeating System. Chester H. Arnold, Boston, Mass., assignor to the American Bell Telephone Company, same place. Filed March 16, 1895.

543,05 . Secondary-Battery Plate. John J. Rooney, Brooklyn, N Y. Filed Nov. 19, 1894.

543,106. Village Telephone System. Charles E. Scribner, Chicago, Ill., assignor to the Western Electric Company, same place. Filed July 2. 1886.

543,160. Telephone-Exchange. Wada Y. Shibata, San Francisco, Cal. Filed Oct. 11, 1894.

543,19 Art of Telephoning. Arthur E. Paige, Philadelphia, Pa. Filed Feb. 25, 1895.

543,231. Writing-Telegraph. Thomas Ewing, Jr., Yonkers, assignor to William E. Gump, Brooklyn, N. Y. Filed Jan. 9, 1894. Renewed Dec. 24, 1894.

543,241. Writing-Telegraph. William E Gump, Brooklyn, N. Y. Filed Feb. 2, 1894. Renewed June 25, 1895.

543,313. Telephone-Transmitter. Zorah E. Patrick, Chicago, Ill. Filed Jan 18 1895.

543,328. Telephone Attachment. Charles E. Bertels, Wilkes Barre, Pa, assignor of one-half to Hedley Pedlar, same place. Filed March 20, 1895.

543,425. Writing-Telegraph. James H. Robertson, Brooklyn, N. Y., assignor to William E. Gump same place. Filed Jan. 9, 1894. Renewed Dec. 24, 1894.

543,426. Writing-Telegraph. James H. Robertson, Brooklyn, N. Y., assignor to William E. Gump, same place. Filed Dec. 19, 1894.

543,427. Writing-Telegraph. James H. Robertson, Brooklyn, N. Y., assignor to William E. Gump, same place. Filed March 2 , 1895.

543,428. Writing-Telegraph. James H. Robertson, Brooklyn, N. Y., assignor to William E. Gump, same place. Filed March 2 , 895.

543,429. Writing-Telegraph. James H. Robertson, Brooklyn, N. Y., assignor to William E. Gump, same place. Filed March 21, 1895.

SIGNAL APPARATUS, ANNUNCIATORS, ETC.

542,63 . Automatic Railway-Signal. Alonzo J. Griffin, Wilkesbarre, Pa., assignor of one-fourth to George T. Griffin, same place. Filed Aug. 7, 1894.

542,664. Electric Annunciator. Henry C. Thomson, Boston, Mass., assignor to the Electric Gas Lighting Company, Portland, Me. Filed Oct. 2, 1894.

542 697. Burglar-Alarm Circuit-Closer. Albion A. Vanderpool, Newark, N. J. Filed Nov. 8, 1894.

542,761. Electric Block Signal for Railroads. Angus C. Gordon, Rochester, N. Y., assignor to the Gordon Railway Signal Company, same place. Filed May 13, 1895.

542,7 9. Electric Signal Apparatus. Thaddeus B. Keeler, Rahway, N. J, assignor to Arthur H. Johnson, same place. Filed March 11, 1895.

542,775. Fire-Alarm. Josiah R. McCoy, Marshalltown, Iowa. Filed April 8 1895.

542, 88. Fire-Alarm Device. John F. Snapp, Frichton, Ind Filed April 13, 1895.

542,883. Annunciator. John W. Olson, Chicago, Ill. Filed Nov. 21, 1894.

542,916. Electrical System for Signaling Between Trains. Alejandro Basanta y Baque, Madrid, Spain. Filed Jan. 21, 189 .

542,926 Electric Annunciator. William J. Clarke, Trenton, Canada. Filed Feb. 5, 1895.

542,928. Signaling Apparatus. Lucien S. Crandall, Par-1-h, N. Y. Filed Feb. 17, 1893.

543 000. Electrical Time-Annunciator. Edward M. Edgerton, Chicago, Ill. Filed Feb. 12, 1892.

543,104. Fire-Alarm Box. Charles A. Rolfe, Chicago, Ill. Filed May 10, 1895.

543,322. Railway-Signal. Joseph B. Stewart, Haverstraw, N. Y. Filed Aug. 24, 1894.

MISCELLANEOUS.

542 640. Electric Governor. William W. Handy, Lake Roland, Md. Filed May 1, 1895.

542,663. Electric Measuring-Instrument. Elihu Thomson, Swampscott, Mass., assignor to the General Electric Company of New York. Filed April 25, 1895.

542,67 . Insulating-Shield for Metallic Poles. William J. Braley, Fall River, Mass. Filed April 17, 1895.

542,732. Submarine Mine. William M. Huskisson, London, England. Filed Nov. 2 , 1894.

542,771. Means for Generating Electricity from Car-Wheel Axles. Morris Moskowitz, Newark, N. J., assignor to the National Electric Car Lighting Company of West Virginia. Filed Feb. 27, 1895.

542, 72. Make-and-Break Switch. Morris Moskowitz, Newark, N. J., assignor to the National Electric Car Lighting Company of West Virginia. Filed April 23, 1895.

542,773. Polarized Compound Switch. Morris Moskowitz, Newark, N. J., assignor to the National Electric Car Lighting Company of West Virginia. Filed May 2, 1895.

542 848. Electric Switch. George T. Eyanson, Philadelphia, Pa. Filed May 10, 18 5.

542 945. Electric Meter. Henry A. Rowland, Baltimore, Md., assignor of one-half to Louis Duncan, same place. Filed April 19, 1895.

542,959. Electric Gas-Lighter. Harry G. Grier, Philadelphia, Pa. Filed May 31, 1895.

542,968. Regulator for Alternating Electric Circuits. Chas. P. Steinmetz and Albert H. Armstrong, Schenectady, N. Y., assignors to the General Electric Company, same place. Filed Feb. 16, 1895.

542,979. System of Electrical Distribution. Georg W. von Siemens, Berlin Germany. Filed April 26, 1893.

542,986. Electrodepositing Device. John Bossard, Dubuque, Iowa. Filed Nov. 11, 1893.

543,003. Electromedical Apparatus. Jacob R. Etter, Crawfordsville, Ind. Filed June 19, 1893.

543, 13. Fire-Alarm Box. John T. Stack, Chicago, Ill., assignor to the Gamewell Fire-Alarm Telegraph Company, New York, N. Y. Filed Jan. 2, 1894.

543,065. Electrically-Controlled Voting-Machine Charles A. Stitzer, Central City, Neb. Filed Nov. 27, 1893.

543,089. Meter for Alternating Electric Currents. Ludwig Gutman, Pittsburg, Pa. Filed May 20, 1 9 .

543,116 Gas-Engine Igniting Apparatus. George W. Weltenbaugh, San Francisco, Cal. Filed Dec. 17, 1894.

543,157. Explosive Engine. Michael L. Mery, Chico, Cal. Filed Feb. 7. 1895.

543,181. Electric Switch. John W. Hearn, Brooklyn, N.Y. Filed Oct. 3, 1893.

543,198. Electric-Current Distributer. Elihu Thomson, Swampscott and Edwin W. Rice, Jr., Lynn, Mass., assignors to the Thomson-Houston Electric Company of Connecticut. Original application filed April 24, 1884. Divided, and this application filed Oct. 3, 1892.

543,249. Process of Refining Sugar by Electrolysis. Emile Javaux and Charles F. Gallois, Paris, France. Filed May 26.

543,33 Electric Registering Apparatus. Alphons Custodis, Dusseldorf, Germany. Filed March 19, 1895.

543,357. Electric Transportation System. Richard E. Sherman, Chicago, Ill. Filed March 1, 1895.

543,3 4. Testing-Circuit for Alternating-Current Systems of Distribution. Herbert C Wirt, Schenectady, N.Y., assignor to the General Electric Company of New York. Filed April 23, 1895.

543,409. Electrical Switch. Henry Steubner, Philadelphia, Pa. Filed Jan. 19, 1895.

DESIGN.

21,473. Electric-Light Shade. Harrison D. McFaddin, East Orange, N. J. Filed June 10, 1895. Term of patent 7 years.

THE TELEPHONE WORLD.

EASTERN TELEPHONE ASSOCIATION.

Plans of Organization Being Formulated by a Committee of Five.

The Eastern Association of Independent Telephone Manufacturers is yet in the formative stage, but enough has been accomplished to assure the success of the movement. An informal meeting was held in New York on the 24th inst. which was attended by the following named gentlemen:

A. H. Chadbourne, United States Telephone Construction Company, Philadelphia, Pa.

S. J. Turnbridge, Utica Fire Alarm and Telegraph Company, Utica, N. Y.

Benjamin Tice, Lockwood Telephone Company, New Brunswick, N. J.

H. S. Douglas, Century Telephone Company, Boston.

J. D. Leatherbee, National Telephone Manufacturing Company, Boston.

G. A. McDowell, Manhattan Electrical Supply Company, New York.

Palmer Bros., Mianus, Conn.

H. C. Williamson, United Electric Telephone Company, New York.

Messrs. Coy and McArthur, Franklin Telephone and Electric Company, New York.

John H. Scofield, Phœnix Interior Telephone Company, New York.

Joseph R. Strong, Tucker Electrical Construction Company, New York.

A. De Veau, De Veau & Company, New York.

At this meeting there was a free interchange of opinions as to the purposes and scope for which an association should be formed, but no definite action was taken further than the appointment of a committee consisting of five members, the duty of which shall be to formulate the plan of organization. Upon the completion of their work, a meeting is to be called for the consideration of the committee's report and the formal organization of the association.

TROLLEY VERSUS TELEPHONE.

Electric Railways Liable for Damages for Injuries from Conduction, but not from Induction.

Some new distinctions in respect to the conflict between electric railway companies and telephone companies in the use of streets, have been developed in the Tennessee case of the Cumberland Telephone and Telegraph Company against the United Electric Railway Company. This was not, like several previous cases on this controverted point, a suit for an injunction against the use by an electric railway company of currents damaging to the telephone line, but an action to recover damages caused by such interference.

The court holds that the railway company is entitled to use the streets, and that such use gives the telephone company no right to complain. Therefore no damages for injury to the telephone line from induction caused by the parallelism of wires on the street could be recovered. But for conduction, charging the ground for considerable distances outside the streets, and disturbing the use of a prior existing telephone line, the railway company must pay the damages, and these were held to be the cost of return wires for the telephone line.

Two Good Contracts.

The La Crosse Telephone Company, La Crosse, Wis., has awarded the contract for its central office exchange outfit and 500 telephones to the American Electric Telephone Company, Kokomo, Ind. This telephone and switchboard were chosen after a careful examination of twenty-four different makes.

The exchange equipment and 125 instruments for the new exchange at Monroe, La., is another contract just awarded to the American Company.

Telephone Litigation.

The Western Electric Company of Chicago has filed a bill against the Viaduct Manufacturing Company, A. G. Davis and John R. Johnson, praying for an injunction to restrain the defendants from an alleged infringement upon telephone switches and magneto call bells, and asking for an accounting.

The switch referred to is the patent of Thomas Watson, assigned by Watson to the American Bell Telephone Company, and by the latter to the Western Electric Company.

The Viaduct Company propose to contest the suit, and claim that the telephone switch manufactured by the company does not infringe the patent referred to in the bill.

An ordinance passed by the city council of Creston, Ia., has fixed the maximum telephone rentals to be charged by the Iowa Union Telephone Company at $3 per month for business houses and $1.50 for residences. The rates now in force are $5 and $3.

Mayor Bostwick can give information relative to the police telephone system which is to be installed at Jacksonville, Fla.

The Texas Telegraph and Telephone Company will establish an exchange at Houston, Tex. B. Krain can give information

C. W. Booth is secretary of the Rockport Telephone Company, organized to build an exchange at Lockport, Tex.

C. L. Downey, of Murphysboro, Ill., has asked for a telephone franchise in Pinckneyville, Ill. It is the intention to establish a local exchange and to extend the line to Duquoin, Ill.

The Martinsville Telephone Company, Martinsville, Ind., has been organized with a capital stock of $[illegible],000.

The National Telephone Construction Company of Milwaukee has asked for a franchise at Kenosha, Wis.

The National Conduit Manufacturing Company has secured the contract and is at work on the underground telephone conduit system at New Bedford, Mass.

Business men of Davenport, Ia., are organizing a telephone company with a capital of $20,000.

The Cumberland Telephone Company will extend its service to Dover, Erin and Clarksville, Tenn., when a subscription of $2,000 has been raised.

The head offices of the Order of Railway Telegraphers are to be moved from Vinton to Peoria, Ill.

W. N. Shine and M. B. Rice are promoting a new telephone exchange at Jacksonville, Fla. When the rights of way have been granted and 400 subscribers obtained, the installation of the plant will be commenced. The "M & B." system will be used.

The long drawn out contest for a telephone franchise in Sheboygan, Wis., has at last been decided by the granting of rights of way to Joseph N. End, Arthur F. Winter and William C. Johann, all local capitalists. The franchise fixes the rates at $24 for commercial and $ 8 for residence instruments. Work is to begin in the near future.

The Decatur Harrison Telephone Company, Decatur, Ill., has been sold under a mortgage of [illegible]7,900. The company began operation July 1, 1[illegible]9. There were 500 subscribers at $[illegible]6 and $24 per year.

The American Bell Telephone Company's output of instruments for the month ended July 20 shows: Gross 13,837, increase 7,40[illegible]; net 6,324, increase 5,[illegible]48; total connected July 20, [illegible]34,[illegible]81, against 573,4[illegible]7 a year ago.

The Viaduct Manufacturing Company, Baltimore, manufacturers of magneto bells, telephones, fire alarm apparatus and other specialties, are rebuilding their works at Relay, Md. The new plant will be complete in all its appointments and of a capacity largely exceeding that of the plant destroyed by fire in 189[illegible].

In connection with the Southwest Georgia Telephone Company, the Postal Telegraph Company will extend its line from Americus to Dawson, Ga.

The Southern Bell Telephone Company will erect a $25,000 building at Savannah, Ga.

The Phœnix Telephone Company of Indianapolis, Ind., has been granted franchises at Mankato, Minn., and Fort Dodge, Ia.

The Rahway Mutual Telephone Company, Rahway, N. J., will erect its plant as soon as the amended ordinance is signed by Mayor Daly.

The Hudson River Telephone Company directors on the 18th inst. declared the regular quarterly dividend of three-quarters of one per cent. It was decided to build a new line from Glens Falls to Whitehall.

The Flatbush District Telegraph Company has filed a certificate amending its articles of incorporation to permit the company to maintain lines through that part of Brooklyn formerly the town of New Utrecht, and also through Bay Ridge, West Brooklyn, New Utrecht, Blythebourne, Fort Hamilton, Bath Beach, Bensonhurst, Unionville, Sheepshead Bay, and other points in Kings County to and through Coney Island.

The Southern Bell Telephone Company's lines will be extended to Pensacola, Fla., within the next few months.

The Wisconsin Telephone Company will establish a sub-exchange in South Side, Milwaukee.

EDITORIAL NOTES.

There are still left in this trade a large number of men who have entered into it for their life work. They may be disheartened, but they have not given up. It is for them that we write. To them we present our argument, and to them we must all look for the re-establishment of business principles, the reinforcement of the doctrines of common sense.

It is for these men to consider just why wrong has temporarily triumphed over right, why it was possible for the tricksters and adventurers to bring the industry to its present condition.

And when these questions receive careful thought the only answer possible is that the electrical press has not done its duty.

If the "Electrical Engineer," the "Electrical World," the "Electrical Review" and the "Western Electrician" had faithfully done their duty by the trade they claim to represent, whose best interests they claim to guard, the present situation would never have confronted us.—"ELECTRICITY," June 5, 1895.

The Brush Double Carbon Patent.

In our last issue the endeavor to explain the scope of the Brush double carbon patent in the fewest possible words led us to be somewhat less explicit than seems desirable in view of the importance of Judge Showalter's decision. The limitations of the patent are very clearly shown in the wording of the description accompanying the specification, which is in part as follows: "The operation of my device as thus far specified is as follows: When the current is not passing through the lamp, the positive and negative carbons of each set A, A′ *are in actual contact.*".

This feature seems to be one of the essentials to the lamp which Brush covered by his patent, viz., that the positive and negative carbons in each set are normally in actual contact before the current is passed, so that the several sets of carbons form parallel paths for the current until the mechanism becomes operative. It is believed that if the several pairs of carbons are not thus normally in contact, but should be hung up so that they do not normally form parallel paths for the current until the mechanism becomes operative, they do not infringe the Brush patent.

The specification goes on: "When, now, a current is passed through the lamp the magnetic attraction of the helices E will operate to raise the lifter D. This lifter, operating upon the clamps C and C′, tilts them, and causes them to clamp and lift the carbon holders B, B′ and thus separate the carbons and produce the voltaic arc light, but it will be *especially noticed that the lifting and separation of these carbons is not simultaneous.* One pair is separated before the other. This separation breaks the circuit at that point, and the entire current is now passing through the unseparated pair of carbons A′, and now when the lifter, continuing to rise, separates these points, the voltaic arc will be established between them and the light thus produced."

This is the second feature, and one which is strongly insisted upon, viz., the *dissimultaneous* separation of the various pairs of carbons and the consequent establishment of the arc only between the last pair separated. This feature would imply, even in the absence of other specification or description, that the several pairs of carbons were normally in contact and in parallel relation to the circuit, and was considered by the Court one of the most important features of the patent. Brush himself evidently considered it such, for in the specification he says: "The lifter D, in the present instance, is so formed that when it is raised it shall *not* operate upon the clamps C, C′ simultaneously, but shall lift *first one* and *then the other.* This function of dissimultaneous action upon the carbons or their holders, whereby one set of carbons shall be separated in advance of the other, *constitutes the most important feature of my present invention.*" There is certainly no ambiguity about this, so that it is apparent that lamps not possessing this feature are not covered by the patent.

Still another feature is clearly indicated where he says: "My invention comprehends, broadly, any lamp or light regulator where more than one set of carbons are employed, wherein—say in a lamp having two sets of carbons—*one set of carbons will separate the other.*" This is an important feature, and upon its interpretation hinged partly the question whether or not two separate lamps combined in one structure and actuated by separate mechanisms were also covered by the patent. It is very clear that such an arrangement was not contemplated, for it is insisted that the several carbons are actuated *dissimultaneously* by the same mechanism.

And the last feature is, that the various pairs of carbons are successively called into arc-maintaining action only when the feeding carbon of the previously acting pair has burned so short that it cannot feed any more.

To recapitulate: the Brush patent describes a lamp containing two or more pairs of carbons, the terminals of each pair being normally in contact, so as to form multiple paths for the current; a lifting device by which the added pair of carbons (in the case of a double carbon lamp) were first separated, thus throwing the entire current through the other pair, and thus determining that the arc should form between said other pair or the last pair separated; a single lifting device actuating separate clutches for each pair of carbons, by which the latter were separated *dissimultaneously* in a predetermined order, and permanently holding the added pairs of carbons in such separated relation while the last pair separated, between whose terminals the arc was maintained, might be fed together as they burned away, and an arrangement by which, only when the arc-maintaining carbons had burned away so short as not to permit of their further feeding, could the feeding mechanism of the succeeding pair of carbons come into action.

The descriptive matter in connection with the specification makes the method of procedure so clear that it seems at first sight very strange how other Courts could have differed with Judge Showalter as to the scope of the invention. But here is illustrated again the baneful effects of so-called expert testimony, which was called in solely for the purpose of involving a very simple thing in such a cloud of mystery as to befuddle the Court, and to assign a controlling importance to features not written into either the militant or the alleged infringing patents. It is with no disrespect to our Judiciary that we say that there are few of them whose training or methods of thought are such as to enable them to discriminate in a safe manner between the essentials and the non-essentials of a purely electro-technical question. To a man without special knowledge and training there can often be no *a priori* course of reasoning by which he may arrive at the relative importance of the various features of the questions presented, and he must therefore rely upon the sworn testimony of so called electrical experts, who are in fact employed on either side *not* as experts in the popular acceptation of the term, but as associate counsel.

It is interesting to look over the previous litigation involving the same patent. As shown in our last issue, the first suit brought on this patent was that against the Ft. Wayne Jenney Company upon the Cain lamp. This case was brought before Judge Gresham sometime in 1886 or 1887 and decided by him the latter part of 1889. The only defence made was that the Brush patent itself was invalid, and could not therefore be infringed. This being practically the only point at issue, viz., the validity of the Brush patent, the decision sustaining its validity made a victory for the Brush Company without involving the question as to whether the Cain lamp did or did not infringe the Brush patent. As a matter of fact, the Cain lamp did not infringe the Brush patent, as subsequent events have clearly shown, but the defence having chosen their own battlefield were defeated on a question of their own raising, whereas had they made another issue they certainly would have won. With this precedent no court of lesser or equal jurisdiction could be found to reverse it, and preliminary injunctions were readily granted upon application of the Brush Company. A second suit was brought against a user of the Indianapolis Jenney Electric Light Company's double carbon lamp, and this, in view of Judge Gresham's previous decision, was practically admitted to be an infringement, and the decision was therefore, of course, in favor of the complainant. The next case decided was against a user of the Scribner lamp, in Toledo. This was in the Federal Circuit Court and the Western Electric Company were not a party to it. The decision therein reached did not affect the Western Electric Company's case, just decided, because the latter was in a court of another jurisdiction. A suit, however, had been previously begun in the Northern District of Illinois against the Western Electric Company, and in this Judge Gresham granted a preliminary injunction because of the finding of the Court at Toledo—the two suits being upon the same Scribner lamp, which it has now been decided is no infringement at all.

In this last case, just decided, some curious testimony was introduced by alleged experts, some of which is called to mind by an editorial in the *Electrical World* of last week. It was to the effect that a double carbon arc lamp came into use and was perpetuated merely as a fad, and that ordinary mechanical skill would have enabled one to obtain all-night service from almost any type of the so-called single carbon lamps in use prior to 1884.

While from the general character of much of our so-called electrical expert testimony we are not surprised that such a statement should be made before the court, we are surprised that it should be repeated with presumptive editorial sanction in a paper like the *World*.

The witness to whom this statement is attributed may in his capacity of associate counsel have had an object to gain by making it, but its repetition by the *Electrical World*, with the endorsement that "the point he makes seems to be one of some weight," implies an ignorance of the state of the art on the part of the editor that is surprising.

There is absolutely no truth in the statement, as every one knows who was familiar with the art at that time.

In the early history of the art the length of carbons used was practically limited to the length which they could be turned out *straight*.

While they could be molded of any length desired, it was with exceeding difficulty that they could be baked without warping or bending. This was in fact one of the greatest difficulties encountered in the early manufacture of carbons and the one which determined the length of carbons commercially manufactured. In the second place, the length was again limited by the resistance. With the crude materials and imperfect methods then at hand, the best carbons had a very high resistance per unit length, so that carbons long enough for all-night use, even if in the then state of the art they could have been commercially manufactured, would have wasted so much energy as to cause them to be discarded for this reason alone in competition with shorter carbons. In fact, carbons could be made longer even then than it was desirable to use them, as was evidenced by the frequent "pencilling" due to their large internal resistance.

The life of a short carbon could not be advantageously lengthened by increasing its diameter, for various reasons. The first of these was that with a larger mass of carbon to heat, the high efficiency was decreased, just as it would be in an incandescent lamp were the mass and radiating surface of the filament large, and the second because the distribution of the light from the large carbons was far inferior to that from small carbons. To gain efficiency, therefore, the carbons required to be small—the smaller the better. This greatly increased their resistance per unit length, and limited that length by the considerations of economy. The electroplating of the carbons with copper, as practised by Weston and others, and afterward patented by Brush, was an immense step in one direction, but with the lessened diameter of the carbons their tendency to bend and warp in baking was increased, so that the length was again limited. Even to-day, with our improved methods of manufacture, the difficulties with carbons increase very rapidly with their length, for if not perfectly straight, or if there be the slightest lateral movement of the carbon or rod, the tendency is for the carbons to slip by one another and stick. In the earlier days these difficulties were enormously magnified, and such a statement as that endorsed by the *Electrical World* could only be made either by "associate" counsel or by one lamentably ignorant of the then state of the art.

The Pomona Plant. We give in another place this week a continuation of the paper read by Mr. George Herbert Winslow at the Niagara Meeting, on "Long Distance Transmission at 10,000 Volts." This is a description of what is known as the Pomona plant, which in its final extension involves an electrical transmission of 2 ¾ miles, thus constituting it at present the longest transmission by electrical or other means in the world. A few years ago the successful transmission of energy to this distance would have excited universal wonder and admiration, but such has been the progress of electrical development that the reading of this paper at Niagara excited absolutely no comment or discussion.

The probable reason for this was twofold. In the first place, the audience was a technical one, and to the electrical engineer the mere ability to transmit current over great distances has never been questioned. To the engineer there are always two questions: first, can it be done? and second, when it is done, will it pay? The first question has been so authoritatively answered by the 100-mile transmission from Frankfort to Lauffen that it will never again be raised even if the distances involved equal those between the Atlantic and Pacific coasts. The second question is a new one with each new installation, and to that question engineers will ever give heed and discussion. Unfortunately, Mr. Winslow, though describing in full the details of construction of this particular plant, omitted all reference to data by which the financial engineering question could be judged. Without these data the paper lacked interest, for however excellent the technical design and workmanship of the project may be, it is a failure if the financial engineering end of it has failed—that is, of course, if the sole object of the project is to make money. Without intending to disparage the engineering ability displayed in the Pomona plant, there are probably twenty or forty other engineers in this country who could design and erect an equally good one from the purely technical standpoint, and it is equally probable that no two of them would follow out the same design. If the Pomona plant *pays*, then the present design has extreme interest. But, as before stated, Mr. Winslow merely states the physical engineering difficulties encountered and how they have been successfully surmounted, without indicating at all the financial engineering difficulties that were met or permitting his audience to judge whether or not they were solved. In this practical and utilitarian age mere beauty has less of attraction than adaptability, and unless the means employed are proved adequate to the ends desired, no mere attractiveness of those means will commend them to others.

Too often this is lost sight of, and references to what have proved successful in given instances have frequently been cited to prove something that they do not and cannot prove in another case. As an illustration in point: In the Frankfort-Lauffen experiment the sole object was to settle certain technical questions involved in transmissions at unusual voltages and under some hitherto untried conditions. The question of financial engineering did not enter into the project for a moment. The questions which it was intended to settle, as well as others, were all settled in a most satisfactory and gratifying manner, and the experiment was therefore a success of the most marked character. The fact that the power cost five times as much when delivered at Frankfort as it could be generated for locally by steam had nothing to do with the case, nor would it have had any bearing on the case had it cost twenty times as much; and yet we are constantly hearing this experiment cited as a marked illustration of successful transmission of power, whereas in the commercial aspect of the case it was a most marked illustration of a kind that would bankrupt any company that might be foolish enough to undertake it.

Now, in the San Bernardino transmission of 28¾ miles, assuming that the power is transmitted so as to successfully compete with locally generated steam power—what are the conditions of competition? What can locally generated power be sold for at a profit? We know that it is only a question of the cost of the local article how much we can afford to pay to bring articles from outside to compete with it. We happen to know that fuel is worth in San Bernardino about $8 per ton. Mr. Winslow does not state that, nor does he state what other supplies that go to make up the cost of power are worth at that point.

Supposing, as we do suppose, that the San Antonio Light and Power Company can sell their current for light at San Bernardino—can they sell it for power? We have understood that they do not sell it for power. If this be so, the question naturally arises, why? If it pays to transmit this power to San Bernardino, would it pay to transmit it the same distance to other localities? Evidently there are two questions involved in this, neither of which does Mr. Winslow answer. The first of these is, how much does power cost at San Bernardino? and the second is, what are the fixed charges on the transmission plant?

It is this indefiniteness or silence on these vital points that makes the paper so unsatisfactory and is probably the chief cause why the paper received neither comment nor discussion at the time of its reading. The second cause is probably the fact that few of the engineers regarded the author's method of governing his wheels as in accordance with the best engineering practice. It is our own opinion that a mere statement of the conditions would be enough to condemn Mr. Winslow's method of regulating by diversion, but as if this was not enough his further defence would convince the most skeptical.

The paper is a very readable one however, contains a great deal of information that may be of interest to the student, and is a well written description of a very important engineering enterprise, *as far as it goes.* From the engineering standpoint, however, it is like the play of Hamlet with the character of Hamlet left out. It is a description of an engineering work with the chief data which should make such a description of value entirely eliminated.

* * *

Storage Battery News. Storage batteries are to be tried again on the Fourth Avenue car line in this city. This time the chloride type will be experimented with. There is no reason why they should not be successful if the company is willing to pay the price for maintenance. It is worth noting that a few weeks before the announcement of this experiment was made, M. Jules Sarcia, the engineer of the "Societe Anonyme pour le Travail Electrique des Metaux," which has had charge of the much talked of storage battery traction experiment in Paris, reported in the "Bulletin de la Societe Internationale Electriciens" (see ELECTRICITY, Vol. IX, No. 2,) that he had been compelled to discontinue the use of positive plates of the Laurent-Cely (chloride) type and return to the "primitive form which Faure gave them." His reasons for discarding the former are given as follows:

> After the formation, their active material is composed of peroxide of lead as crystalline as the original spongy lead, and, in consequence, of great mechanical solidity; but by the normal succession of charges and discharges the crystalline peroxide of lead becomes powdery and in consequence falls to the bottom of the jar.
>
> This fall of peroxide is fatal, and every manufacturer of accumulators who tells you of positive plates with an indefinite life deceives himself or deceives you. The average life of the first plates of tramway batteries was about 8,000 car-miles. After this travel all their peroxide of lead was fallen and their perforated support unfit for service.

Other storage battery news of the week comes from the Chicago *Inter-Ocean*, whose Washington correspondent tells of the plan of one of the trunk lines leading out of Chicago to replace steam by electric locomotives on its mail and passenger trains. There is to be a great generating station at the coal mines in the interior of Illinois, from whence lines will run to various charging stations along the line of the railroad. Here chloride plates will be charged. Huge cranes will take out the used plates, substituting therefor the newly charged ones at the various charging stations, and presto!—the entire electric traction problem is solved.

We do not believe the editor of the *Inter-Ocean* would have printed such stuff if he had given any thought to this subject. We give him warning that his Washington correspondent has been imposed upon—probably by the wicked agents of a storage battery company whose chief business appears to be the sale of stock--$13,000,000 of it. The storage battery has its uses, and the chloride type of cell is no doubt as good as any; but anyone who talks of applying it for traction purposes on trunk lines is either a fool or a knave, probably the latter. The idea has been tried in this country almost continuously for over ten years on ordinary street car work, and has proved a failure in every case. It will never be successful, even for travel at the rate of six miles an hour and on a perfectly level and straight track, until some one makes a new *discovery.* It is not *invention* which is needed. Entirely new methods must be discovered before any storage battery traction scheme is worth the attention of any investor.

Under the Searchlight.

Views and Opinions on Timely Topics.

The Substitution of Electricity for Steam in Railway Practice.

Commenting on Dr. Louis Duncan's inaugural address at the Niagara meeting of the A. I. E. E., the *Evening Post* said in a recent issue:

> As to passengers, Dr Duncan takes the report of the New York Central Company for 1892, and finds that the total number of through passengers carried was but 234,650, while the number of local passengers was 21,978,979. "It will be seen," he says, "that the through traffic is but a small percentage of the total number of passengers, and that the question of preserving this local traffic is of great importance Now, the greater part of this local traffic will in the next few years be taken by the electric roads paralleling the steam roads, unless some effort is made to control the electric roads or to give an equally good service between adjacent towns" This far-reaching conclusion appears to depend upon the large local travel of the New York Central as revealed by the statistics just given. Before reaching that judgment Dr. Duncan ought to have investigated the subject a little further.
>
> The New York Central Company in making up its reports counts as "through" passengers only those traveling between New York City and Buffalo on its main line, or between New York and Chatham on the Harlem division. This division between "through" and "local" is made under rulings by the New York State Board of Railroad Commissioners, and is doubtless accurate enough for the very small use to which the statistics, as thus defined, could be put; but upon such a subject as that of electrical competition, they are worse than worthless, they are very misleading. The very large passenger travel to and from New England and the West via Albany is counted as local under this system; so, too, is all traffic which moves in through cars or trains to and from places off the main line, such as between Montreal, or the Adirondacks, or the Thousand Islands, or Saratoga and New York or any other city. Nor is this all. There is a large amount of passenger traffic which indeed starts from or is destined to some city or village on the New York Central, and is therefore "local," but because the passengers are going to or from Chicago or some prominent city at the West they take trains which run through, or connect with other trains which do so. In either case, for the purposes of electric competition, they are "through" travelers for the reason that no local trolley line could secure their passage money. Then there are also to be reckoned the passengers who take the New York Central trains after reaching that line from some connecting local road in New York State; to hold such travel, a competing electric road would require that its lines be extended practically as far as the present steam branches reach.
>
> It is impossible to say how large would be the number of travelers—strictly local—which a parallel line of electric road might hope to take away from the New York Central, but manifestly the number is very much smaller than Dr. Duncan supposes; yet that strong trolley competition could hurt the steam company, if established, there is no doubt; of that we may judge from the effects of trolley lines upon the Pennsylvania Railroad near Philadelphia, and upon the New Haven Railroad in New England. But that the New York Central would prove the easy prey supposed by the author of the address is an error into which the gentleman has been led by quoting statistics compiled for a different purpose and on a different basis from that required for a proper judgment as to the probabilities of success for trolley competition.

Which all goes to show that while Dr. Duncan could doubtless give Mr. Thomas L. Greene, the statistical expert of the *Post*, much valuable instruction in the science of electrics, Mr. Greene is equally competent to give Dr. Duncan valuable instruction in the art of statistics and how *not* to handle them. As the *Sun* once said, in discussing the question of statistics, "there are times when two and two make not four, but five and a quarter."

Points from the Inside.

(From Town Topics.)

The point comes directly from the inside that General Electric will sell considerably above 50 this year. When the movement gets well under way, the stock will cross 45 in double-quick order.

Similar points taken directly from the inside of the General Electric Company (from J. P. Morgan, C. H. Coster, C. A. Coffin, etc.,) have already cost investors in General Electric and its sub-enterprises about $25,000,000.

* * *

EVIDENCE has been laid before us that the solicitors who are canvassing this city in behalf of the "Steam and Street Railway Purchasing Agent's Directory" are worthy of no confidence whatever. Of the publication itself, if such there be, we know nothing. But the methods of the agents referred to are dishonest and fraudulent, and they should not be received in any man's office. There is, moreover, one law of business to which there is no exception: no concern should pay any money in advance for an advertisement except to a well-known publisher, and even then it should never be paid through agents. We would like to hear more from our constituents as to their experience with the solicitors for the "Steam and Street Railway Purchasing Agent's Directory," whose main office is said to be in the "Evening Post" Building, Chicago.

A. T.-H. BOND DEAL.

R. Gardner Chase of Boston and Charles E. Legg of Chelsea have brought an action against the Thomson-Houston Electric Company to recover $44,500 worth of bonds which they claim the defendant obtained from them through misrepresentations.

The plaintiffs purchased 150 first mortgage 6 per cent. bonds of the Bangor Electric Light and Power Company, at the par value of $500 each.

On June 1, 1891, the B. E. L. & P. Co., together with other companies, conveyed to a Maine corporation, called the Public Works Company, all its properties, subject to first mortgages.

July 15, 1891, the Public Works Company issued $1,000,000 of 5 per cent. bonds for the purpose of refunding the bonds of the B. E. L. & P. Co. and the bonds of the other companies which it had acquired.

Oct. 12, 1891, while the plaintiffs still held $44,500 of the B. E. L. & P. Co.'s bonds, they allege in their bill that the defendant falsely and fraudulently represented to them that a large majority of the holders of the first mortgage bonds of the several companies had assented to the plan of reorganization, and that defendant wished possession of plaintiffs' bonds for the purpose of exchanging them for Public Works Company's bonds. Relying on these representations, plaintiffs delivered the $44,500 of bonds for exchange.

The plaintiffs allege that they have lately learned that defendant never delivered the bonds to the Public Works Company, but fraudulently keeps the same.

We suppose these $44,500 of bonds go to make up the item of $64,500 bonds of the Bangor Electric Light and Power Company, claimed as an asset by the General Electric Company in their last report.

* * *

Mr. H. M. Byllesby must have had visions of great wealth when he saw the first car go over the St. Paul and White Bear Railroad. Col. Sellers's figuring his profits on eyewater—so many people, so many eyes, so many *sore* eyes, so many bottles of eyewater sold, millions in it!—must have occurred to him as he contemplated the possibilities of 102 trolley systems, 102 lake resorts with 204 bears, and from $200,000 to $1,000,000 bonds on each system, which Mr. Coffin could sell in Boston at 60. For did not Mr. Coffin say in 1892 to all his agents, that he could take an unlimited number of bonds at 60?

* * *

It is about settled, we think, that the General Electric Company will soon begin a movement to consolidate all their works at one point. The place is very likely to be at Depew.

* * *

According to the Chicago *Chronicle*, "Assistant Chief Manager Bailey of the General Electric Company admits" that his company is seriously considering the equipment of a new trunk line from Chicago to Buffalo on which trains will be run through at the rate of 150 miles an hour. "It is no longer a theory," says Assistant Chief Manager Theodore Buncombe Bailey, "that such a road can be built and operated with safety," and of course he knows, for did he not build an electric railroad in his native town of Ottawa, Ill. (pop. 9,985)?

* * *

A St Louis inventor has patented a device for raising drowned bodies from the beds of rivers and lakes. The apparatus utilizes from four to eight sticks of dynamite in a machine box connected by fine wire to the electric battery on the shore, from which is communicated the spark that fires the heavy charge resting on the river bed.—*New York World.*

Dr. Adams's air line project would be a good subject for this St. Louis inventor to experiment upon.

* * *

Justifiable.

(From the Electrical Engineer, London).

At the North London Police Court the other day, Joseph Triggs, aged 45, compositor, of Walsingham-road, who was found drunk in Stoke Newington-road, excused himself on the ground that in the office where he had been at work all night the electric light had broken down; the gas was put on, which made the air so oppressive. He was discharged.

GENERAL ELECTRIC'S FINANCING POLICY.

Northwest General Electric—The Scheme, the Companies Financed, the Facts and Figures from the Official Record.

HOW BONDS ARE MANUFACTURED FOR NEW ENGLAND INVESTORS.

CHAPTER IV.

The St. Paul and White Bear Railroad Company.

Introductory.

Probably no enterprise which engaged the attention of the General Electric financiers, either in the West or in the East, furnishes better evidence in support of the charge of Electricity, that the whole financiering scheme of Mr. Coffin was a gross swindle, than the one which we treat this week—the St. Paul and White Bear Railroad Company.

When Mr. H. M. Byllesby went to St. Paul as the official head of the Thomson-Houston (G. E.) Company, his predecessor, Mr. E. R. Gilman, was supposed to have applied the Coffinesque system of raising bonds to the limit of his capacity in this direction—which the records show were not small. Mr. Byllesby was, therefore, sent out to discover new worlds to conquer—new schemes for the manufacture of worthless bonds which could be sold in the East. Mr. Byllesby in his industry found one place which had escaped Mr. Gilman's attention, although it was under his very nose.

There was a steam dummy line running from the northern outskirts of the city of St. Paul to a little manufacturing settlement one-third of the way between the terminus of the St. Paul street railway system and White Bear Lake. This steam road was owned by Messrs. Stone & Morton, of St. Paul, the latter a son of ex Gov. Oliver P. Morton, of Indiana. The road had never been profitable, because most of the manufacturing plants established at its northern terminus had been unprofitable and transitory. Mr. Ralph Beach, now of the General Electric railway department, had, among others, met with misfortune in his efforts to establish a wheel factory there. There was no resident population worth mentioning, the workmen preferring to live nearer the city of St. Paul proper. This dummy line had been built almost in a night, with "shingle" roadbed, and was equipped with a half-dozen cars and three locomotives of the kind usually adopted for such service. Having been a losing venture, it was, of course, just what the General Electric financiers desired to begin operations with, though its franchise did not permit of connection with the cars of the St. Paul street car system, there being an interval of two blocks over which passengers must walk. Such small matters, however, as connections with *towns* or with other roads carrying people, were not considered worthy of consideration by these unrivalled financiers. The dummy line had a track 3.5 miles long.

THE SCHEME.

The scheme for utilizing this steam road in the manufacture of bonds and stocks, as it unfolded itself to Mr. Byllesby and was endorsed by Mr. Coffin, was to organize and capitalize a new company to be known as the St. Paul and White Bear Railroad Company, paying for the dummy line with a portion of the bond issue, and selling the rest in Boston. The track was to be extended to the south shore of White Bear Lake, eight miles further, or 11.5 miles from St. Paul.

This was done, $300,000 of bonds planned to be issued and $200,000 of stock, $75,000 of the former going to Messrs. Stone and Morton to pay for the property of the dummy line.

NEW RESORTS WERE NOT NEEDED.

The State of Minnesota has within its boundary no less than 7,000 lakes. By far the larger number of these would, no doubt, be better described as ponds rather than as lakes. It is a fact, however, that scarcely any city, town or village in the State is without its lake, and many of the cities, towns and villages have quite a number of lakes adjacent to or within their boundaries.

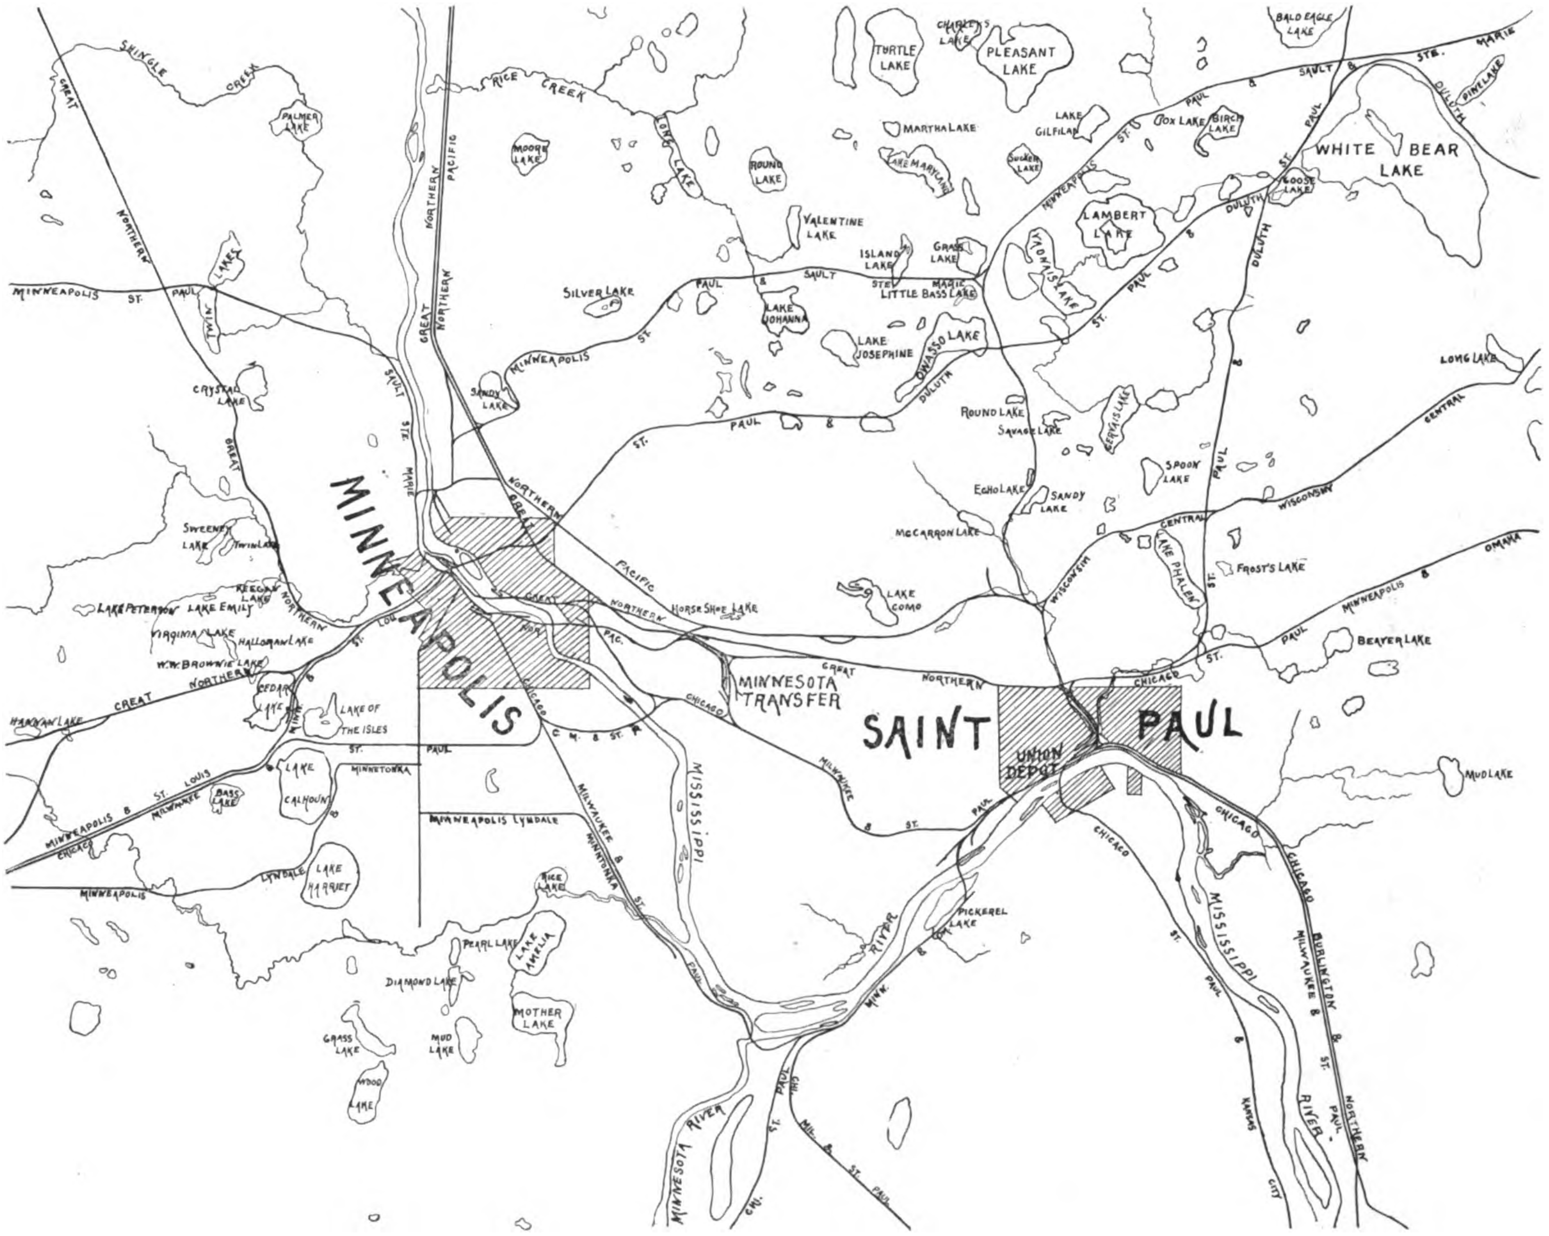
The city of St. Paul itself has, as shown by the accompanying map, no less than 102 of these lakes or ponds within a radius of 12 miles from the center of the city, not to mention the thirty or forty within a like radius around Minneapolis.

Most of them were surrounded by virgin forests, as was the southern shore of White Bear Lake. But the grand opportunities presented were of course not lost upon Messrs. Byllesby and Coffin. Mr. Byllesby's letters are, no doubt, still on file in the General Electric offices, in which he dilated upon the possibilities for applying the Thomson-Houston financing scheme to a proposed route to each of these 102 lakes. Why not? Could not each and every one of them be bonded for double enough to cover equipment and construction? And could not Mr. Coffin sell the bonds in Boston, if they could be taken at 60? Two of these lakes must certainly have been in mind for the next efforts after the White Bear scheme had been carried out. They are Goose Lake and Sucker Lake, and we only wonder that the latter was not chosen first in preference to White Bear.

Seriously or honestly considered, there was no apparent reason for building any electric line to White Bear Lake. There was nothing whatever at the terminus of the road except a wilderness. The scheme was, however, as outlined to the purchasers of the bonds, to establish there a summer resort. If there was any need or chance of success for any further resorts of this nature around St. Paul and Minneapolis, the fact was not apparent to local capitalists.

The city of Minneapolis has no less than ten lakes or ponds within its boundaries, and a large number adjacent to it. At least three of these lakes within the boundaries of the city were made most attractive pleasure resorts, the boundaries being surrounded by excellent roads, lighted by electricity and with beautiful driveways from various parts of the city and from the adjoining city of St. Paul. On the shores of each of these lakes, were splendid pavilions and numerous places for refreshments, also places where boats and fishing tackle could be hired. Public carriages for those desirous of riding through the charming scenery of the lakes; ponies for children, and all the usual means of ministering to the pleasure or comfort of visitors. Excellent music was always to be heard during the summer months. These lakes were easily accessible from any part of the city of Minneapolis, or its sister city, St. Paul, by means of an extensive network of electric railways. These lakes were the favorite resorts of the citizens of both cities, and during the summer months large numbers of the people of both cities visited them daily and nightly.

In addition to these resorts there were quite a



MAP SHOWING THE POSSIBILITIES FOR LAKE RESORTS, TROLLEY LINES AND BONDING OPERATIONS AROUND ST. PAUL.

number of others within a few miles of the boundaries of both cities. The largest of these is Lake Minnetonka, a beautiful sheet of water about twelve miles long and about five wide, situated about ten miles west of Minneapolis and eighteen miles west of St. Paul. Lake Minnetonka is a favorite summer resort for the well-to-do citizens of both cities, and on its shores are numerous handsome private summer residences and a number of very large and fine hotels. The shore of Lake Minnetonka must measure close to sixty miles. The lake is beautifully situated and was easily accessible first by steam railroad, second by steam dummy road, and third by electric line.

Lake Minnetonka and the other lakes referred to were west of St. Paul, and to reach them it was necessary to pass through Minneapolis.

North and northeast of St. Paul, and but a short distance from the city, there are a large number of lakes and ponds, and it was one of the largest of this group that was selected for the swindling operations of the St. Paul and White Bear Railway Company. This lake was already easily and cheaply accessible from that city by the St. Paul and Duluth Railroad.

White Bear Lake is about three miles long, and is two miles wide at its widest part. On the north shore of this lake was the little village of White Bear with a population of 1,300, and in the village were three or four small hotels and boarding houses, together with a dancing pavilion and music hall, both houses owned or run by a man of the name of Ramonetti, who kept a bakery and confectionery store in St. Paul and only kept his White Bear resort open for a period of about three months during the year. The St. Paul and Duluth Railroad had two stopping places on the west shore of the lake, the first being Ramonetti's Pavilion and the second White Bear Beach Depot.

On the south shore there was no settlement, and it was the intention of the promoters of the

St. Paul and White Bear Railroad Company to found a settlement at a point just two miles by water from the village of White Bear. The first step in this direction was to build a railroad and issue stock to the extent of $200,000 and $300,000 of bonds!

It has been said that every well-to-do citizen of Minnesota has a lake of his own, but however this may be, we think we have made it clear that there was no long-felt want for a new summer resort at White Bear Lake or an electric line to carry the people.

LOCAL OPINION OF THE PROJECT.

In considering the prospects of success for this venture it is proper to recall the state of public opinion in the two cities of St. Paul and Minneapolis at that time in regard to the encouragement of new enterprises promising any benefit to the community. Subsidies were raised a most in a day for any sound addition to the business of either city. Land was donated freely, and every effort was made to attract new concerns to locate there. For the simple erection of a large office building the New York Life Insurance Company was guaranteed $1,000,000 of new insurance. Yet no local enthusiasm was aroused for the St. Paul and White Bear Railroad project. True, we have not forgotten that 40 acres of land were donated at Wildwood Park, as the new resort was called, but this came largely from Stone and Morton, who stated when they went out to look things up preparatory to building the road, that they "had land somewhere in that locality, but never knew just where." Subsequently, it may be remarked, most of this land was divided up among the promoters, and the bondholders have no benefit from it whatever its value.

No local capitalists could be found to take any interest whatever in a project which had no hope of success, except, as stated, Stone and Morton, who had a dead horse to dispose of in their dummy line.

The officers for the first year were as follows: President and general manager, W. S. Morton; vice-president, L. K. Stone; secretary and treasurer, W. Ruan; superintendent, S. B. Livermore.

Later some changes were made. At the date of our last report the officers were: President and general manager, H. M. Byllesby; secretary, W. P. Johnson; treasurer, W. Ruan; purchasing agent, S. B. Livermore.

THE RESULT.

But the road was built and bonded, or rather, bonded and built. No large hotels were provided for permanent visitors, but a few harmless amusement schemes were introduced, such as a dancing pavilion, a few swings and two tame bears which Mr. Byllesby sent from St. Paul. The line itself was built through the fields nearly all its length. The novelty of the ride for the first few months attracted quite a number of passengers, and the company apparently made money, as shown by the accompanying official statement for the period covering the first four months' operations.

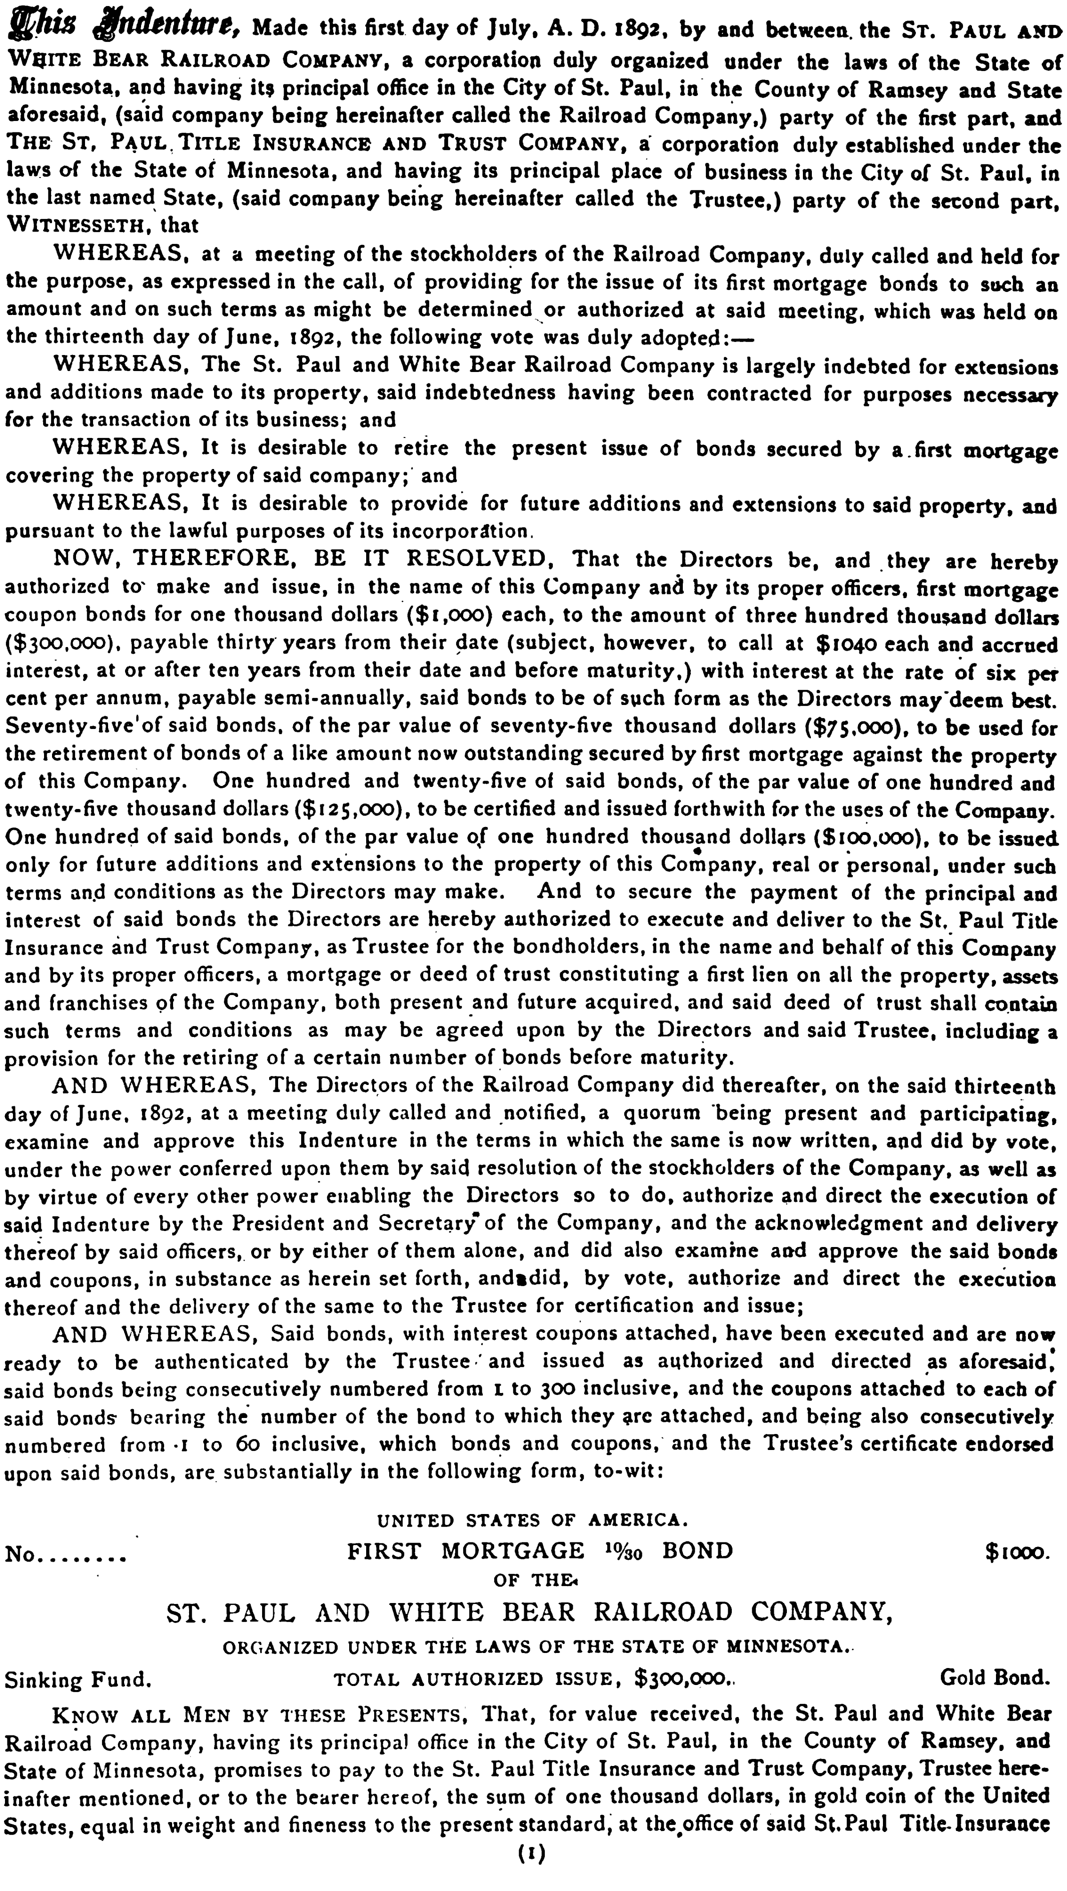
No such showing was made in any later statement. After October the receipts fell to almost nothing, and the loss from operation was from $1,200 to $2,000 per month until the following summer. If it is argued that the road might have ceased operations during the winter and still made money during the summer months, no further answer is necessary than to compute the fixed charges for one year and compare them with the summer's profits:

Gross earnings, July 1 to October 1.	$27,125.97
Operating expenses and fixed charges, 4 months.	22,256.13
Profits (4 months)	$4,869.84
Fixed charges (interest on bonds) one year	18,000.00
Fixed charges (interest on bonds) 9 months	$13,000.00
Deduct profits (4 months)	4,869.84
Shortage for year	$8,631.16

Of course the inevitable came to pass, and Mr. F. A. G. Moe has been appointed receiver of the property. Those who know the situation thoroughly in St. Paul say that the only possible way for securing any return to creditors or bondholders is to tear up the tracks, sell the equipment, and close up the business. There is not and never has been any reason for the existence of the road except to find something which could be *bonded*, and give Mr. Coffin more bonds to take at 60 and sell to his New England friends at 80. We find that of these St. Paul and White Bear bonds $125,000 went to the United Electric Securities Company of Boston

We do not see that any official records of this company are specially needed for educational purposes. The record of the entire transaction is so plain, the end has come so soon, prolonged argument would be superfluous. We present a copy of the first page of the bond agreement merely to show the uniformity of these docu-

BOND AGREEMENT—FAC-SIMILE OF FIRST PAGE.



This Indenture, Made this first day of July, A. D. 1892, by and between the St. Paul and White Bear Railroad Company, a corporation duly organized under the laws of the State of Minnesota, and having its principal office in the City of St. Paul, in the County of Ramsey and State aforesaid, (said company being hereinafter called the Railroad Company,) party of the first part, and The St. Paul Title Insurance and Trust Company, a corporation duly established under the laws of the State of Minnesota, and having its principal place of business in the City of St. Paul, in the last named State, (said company being hereinafter called the Trustee,) party of the second part, Witnesseth, that

WHEREAS, at a meeting of the stockholders of the Railroad Company, duly called and held for the purpose, as expressed in the call, of providing for the issue of its first mortgage bonds to such an amount and on such terms as might be determined or authorized at said meeting, which was held on the thirteenth day of June, 1892, the following vote was duly adopted:—

WHEREAS, The St. Paul and White Bear Railroad Company is largely indebted for extensions and additions made to its property, said indebtedness having been contracted for purposes necessary for the transaction of its business; and

WHEREAS, It is desirable to retire the present issue of bonds secured by a first mortgage covering the property of said company; and

WHEREAS, It is desirable to provide for future additions and extensions to said property, and pursuant to the lawful purposes of its incorporation.

NOW, THEREFORE, BE IT RESOLVED, That the Directors be, and they are hereby authorized to make and issue, in the name of this Company and by its proper officers, first mortgage coupon bonds for one thousand dollars ($1,000) each, to the amount of three hundred thousand dollars ($300,000), payable thirty years from their date (subject, however, to call at $1040 each and accrued interest, at or after ten years from their date and before maturity,) with interest at the rate of six per cent per annum, payable semi-annually, said bonds to be of such form as the Directors may deem best. Seventy-five of said bonds, of the par value of seventy-five thousand dollars ($75,000), to be used for the retirement of bonds of a like amount now outstanding secured by first mortgage against the property of this Company. One hundred and twenty-five of said bonds, of the par value of one hundred and twenty-five thousand dollars ($125,000), to be certified and issued forthwith for the uses of the Company. One hundred of said bonds, of the par value of one hundred thousand dollars ($100,000), to be issued only for future additions and extensions to the property of this Company, real or personal, under such terms and conditions as the Directors may make. And to secure the payment of the principal and interest of said bonds the Directors are hereby authorized to execute and deliver to the St. Paul Title Insurance and Trust Company, as Trustee for the bondholders, in the name and behalf of this Company and by its proper officers, a mortgage or deed of trust constituting a first lien on all the property, assets and franchises of the Company, both present and future acquired, and said deed of trust shall contain such terms and conditions as may be agreed upon by the Directors and said Trustee, including a provision for the retiring of a certain number of bonds before maturity.

AND WHEREAS, The Directors of the Railroad Company did thereafter, on the said thirteenth day of June, 1892, at a meeting duly called and notified, a quorum being present and participating, examine and approve this Indenture in the terms in which the same is now written, and did by vote, under the power conferred upon them by said resolution of the stockholders of the Company, as well as by virtue of every other power enabling the Directors so to do, authorize and direct the execution of said Indenture by the President and Secretary of the Company, and the acknowledgment and delivery thereof by said officers, or by either of them alone, and did also examine and approve the said bonds and coupons, in substance as herein set forth, and did, by vote, authorize and direct the execution thereof and the delivery of the same to the Trustee for certification and issue;

AND WHEREAS, Said bonds, with interest coupons attached, have been executed and are now ready to be authenticated by the Trustee and issued as authorized and directed as aforesaid, said bonds being consecutively numbered from 1 to 300 inclusive, and the coupons attached to each of said bonds bearing the number of the bond to which they are attached, and being also consecutively numbered from 1 to 60 inclusive, which bonds and coupons, and the Trustee's certificate endorsed upon said bonds, are substantially in the following form, to-wit:

UNITED STATES OF AMERICA.

No........ FIRST MORTGAGE $^{10}/_{30}$ BOND $1000.

OF THE

ST. PAUL AND WHITE BEAR RAILROAD COMPANY,

ORGANIZED UNDER THE LAWS OF THE STATE OF MINNESOTA.

Sinking Fund. TOTAL AUTHORIZED ISSUE, $300,000. Gold Bond.

Know all Men by these Presents, That, for value received, the St. Paul and White Bear Railroad Company, having its principal office in the City of St. Paul, in the County of Ramsey, and State of Minnesota, promises to pay to the St. Paul Title Insurance and Trust Company, Trustee hereinafter mentioned, or to the bearer hereof, the sum of one thousand dollars, in gold coin of the United States, equal in weight and fineness to the present standard, at the office of said St. Paul Title Insurance

(1)

ments in all the schemes. There was the stereotyped inducement held out that the bonds were redeemable at $1,040. Mr. Coffin never failed to give his victims a *chance* to make money—on paper.

In the trial balance, a copy of which is also presented, we find the franchise valued at $50,000. This item carries its own moral. The only franchise of any value was the one they could not get—that is, giving them the right to connect with the North Seventh Street line in St. Paul. The steam dummy franchise and the right to continue through the green fields into the wilderness had no value. "Terminal properties, $13,497.36," is also excessive by about $12,000. The only terminal owned was at "Wildwood Park" on White Bear Lake. The power house was about midway on the line, and is included in "Construction, $338,627.40." This latter figure is at the rate of about $30,000 per mile, or nearly double what the entire system should have cost. At the prices then prevailing, $16 000 per mile would have been a generous allowance for the entire system.

It will be noted, moreover, that although $200,000 of bonds had been issued, and the proceeds applied somewhere, after only four months' operations the road was over $12,500 in debt.

CONCLUSION.

We shall be pleased to record the ultimate disposition of this property by the courts, and to report the terms of settlement between the United Electric Securities Company, which bought $125,000 of the bonds (and has been unable to sell them), and the General Electric Company of New York. We shall also be at pains to report the result of the movement now on foot among the swindled preferred stockholders of the Northwest General Electric Company to recover their money from the General Electric Company. Before we have concluded this series of articles, we will, we think, give these preferred stockholders much valuable information for use in their suit.

Of course in this White Bear enterprise it would be useless to apply the same method of analysis which can fairly be applied to most railway systems. It was purely a suburban system, with a large population two miles away from one terminal and two bears and a keeper at the other. The only problem in forecasting the result was whether or not the large population of St. Paul, or any appreciable part of it, could be induced to forego well-established, comfortable resorts, of which there were already large numbers suited to all tastes, pay their fare on the cars of the St. Paul City Railway to the end of the line, walk two blocks. and pay another fare for an eleven-mile ride through the fields to a shabby resort in the woods, where the chief attraction was Mr. Byllesby's two bears.

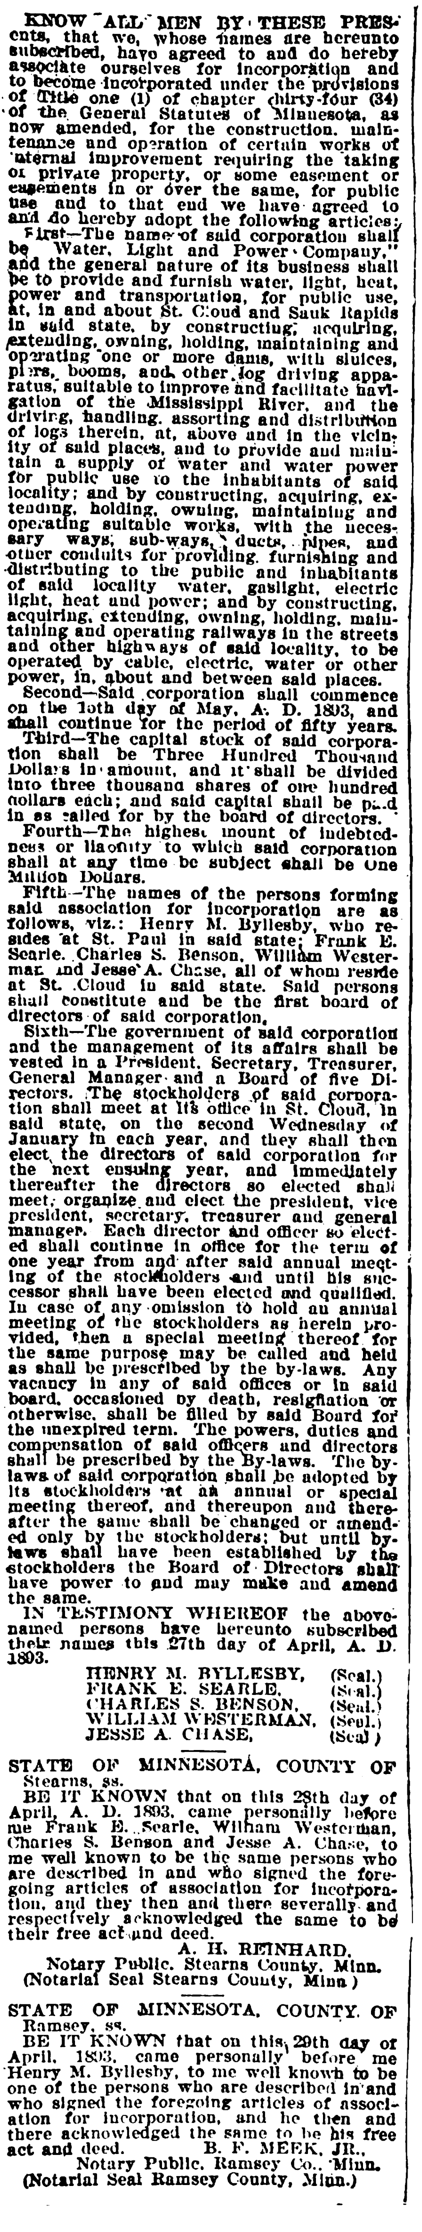
But the General Electric financiers cared little for results of actual operation. They wanted to sell bonds and get quick action on their money. They got it, and with over 50 per cent. of all the companies which they financed in the hands of receivers, it looks as though their victims were also getting plenty of action.

THE ST. CLOUD SCHEME.—II.

In our last issue, in discussing the affairs of the St. Cloud City Street Car Company, we said :

> The trade at St. Cloud City . . . differed in some respects from that at Winona. The town had only 7,686 people. The railway company only was bought, as the scheme did not hold out long enough to permit of buying the lighting company and making another of Mr. Coffin's grand consolidations. There was thus only one capitalization.

When we said that the scheme did not hold out long enough to permit of making another of Mr. Coffin's grand consolidations, we were fortified, as we always are, with documentary proof. This proof we present herewith in the fac-simile copy of an advertisement which appeared in the St. Paul *Pioneer Press* of May, 1893. This was a notice of incorporation of the "Water, Light and Power Company," to provide light, heat, power, etc., for public use in and about St. Cloud and Sauk Rapids.



KNOW ALL MEN BY THESE PRESENTS, that we, whose names are hereunto subscribed, have agreed to and do hereby associate ourselves for incorporation and to become incorporated under the provisions of Title one (1) of chapter thirty-four (34) of the General Statutes of Minnesota, as now amended, for the construction. maintenance and operation of certain works of internal improvement requiring the taking of private property, or some easement or easements in or over the same, for public use and to that end we have agreed to and do hereby adopt the following articles:

First—The name of said corporation shall be Water, Light and Power Company," and the general nature of its business shall be to provide and furnish water, light, heat, power and transportation, for public use, at, in and about St. Cloud and Sauk Rapids in said state, by constructing, acquiring, extending, owning, holding, maintaining and operating one or more dams, with sluices, piers, booms, and other log driving apparatus, suitable to improve and facilitate navigation of the Mississippi River, and the driving, handling. assorting and distribution of logs therein, at, above and in the vicinity of said places, and to provide and maintain a supply of water and water power for public use to the inhabitants of said locality; and by constructing, acquiring, extending, holding, owning, maintaining and operating suitable works, with the necessary ways, sub-ways, ducts, pipes, and other conduits for providing. furnishing and distributing to the public and inhabitants of said locality water, gaslight, electric light, heat and power; and by constructing, acquiring, extending, owning, holding, maintaining and operating railways in the streets and other highways of said locality, to be operated by cable, electric, water or other power, in, about and between said places.

Second—Said corporation shall commence on the 10th day of May, A. D. 1893, and shall continue for the period of fifty years.

Third—The capital stock of said corporation shall be Three Hundred Thousand Dollars in amount, and it shall be divided into three thousand shares of one hundred dollars each; and said capital shall be paid in as called for by the board of directors.

Fourth—The highest amount of indebtedness or liability to which said corporation shall at any time be subject shall be One Million Dollars.

Fifth—The names of the persons forming said association for incorporation are as follows, viz.: Henry M. Byllesby, who resides at St. Paul in said state; Frank E. Searle. Charles S. Benson, William Westerman and Jesse A. Chase, all of whom reside at St. Cloud in said state. Said persons shall constitute and be the first board of directors of said corporation.

Sixth—The government of said corporation and the management of its affairs shall be vested in a President. Secretary, Treasurer, General Manager and a Board of five Directors. The stockholders of said corporation shall meet at its office in St. Cloud, in said state, on the second Wednesday of January in each year, and they shall then elect the directors of said corporation for the next ensuing year, and immediately thereafter the directors so elected shall meet, organize and elect the president, vice president, secretary, treasurer and general manager. Each director and officer so elected shall continue in office for the term of one year from and after said annual meeting of the stockholders and until his successor shall have been elected and qualified. In case of any omission to hold an annual meeting of the stockholders as herein provided, then a special meeting thereof for the same purpose may be called and held as shall be prescribed by the by-laws. Any vacancy in any of said offices or in said board, occasioned by death, resignation or otherwise, shall be filled by said Board for the unexpired term. The powers, duties and compensation of said officers and directors shall be prescribed by the By-laws. The by-laws of said corporation shall be adopted by its stockholders at an annual or special meeting thereof, and thereupon and thereafter the same shall be changed or amended only by the stockholders; but until by-laws shall have been established by the stockholders the Board of Directors shall have power to and may make and amend the same.

IN TESTIMONY WHEREOF the above-named persons have hereunto subscribed their names this 27th day of April, A. D. 1893.

HENRY M. BYLLESBY, (Seal.)
FRANK E. SEARLE, (Seal.)
CHARLES S. BENSON, (Seal.)
WILLIAM WESTERMAN, (Seal.)
JESSE A. CHASE, (Seal.)

STATE OF MINNESOTA, COUNTY OF Stearns, ss.

BE IT KNOWN that on this 28th day of April, A. D. 1893, came personally before me Frank E. Searle, William Westerman, Charles S. Benson and Jesse A. Chase, to me well known to be the same persons who are described in and who signed the foregoing articles of association for incorporation, and they then and there severally and respectively acknowledged the same to be their free act and deed.

A. H. REINHARD,
Notary Public. Stearns County. Minn.
(Notarial Seal Stearns County, Minn.)

STATE OF MINNESOTA, COUNTY OF Ramsey, ss.

BE IT KNOWN that on this 29th day of April, 1893, came personally before me Henry M. Byllesby, to me well known to be one of the persons who are described in and who signed the foregoing articles of association for incorporation, and he then and there acknowledged the same to be his free act and deed.

B. F. MEEK, JR.,
Notary Public. Ramsey Co., Minn.
(Notarial Seal Ramsey County, Minn.)

This company was to be capitalized at $300,000, and $1,000,000 of bonds were to be issued. On the former scheme $100,000 of stock and $125,000 of bonds had been issued.

This was a grand idea of Mr. Byllesby's, but it came too late. The General Electric Company was already on the verge of bankruptcy, and its very name had become so obnoxious that it was not deemed safe to prefix the words General Electric to the St. Cloud Water, Light and Power Company. Moreover, Mr. Coffin had already been found out by his former associates in Boston. The United Electric Securities Company had shut down absolutely on taking any more of Mr. Coffin's bonds, and there was no market for them elsewhere.

Thus the glorious career of the St. Cloud and Sauk Rapids Water, Light and Power Company ended with its incorporation. The giant baby died a-bornin', the $1,300,000 of securities never found their way to the strong boxes of New England investors, and Mr. Coffin is probably a few thousands poorer than he would have been if the scheme could only have been carried out and nursed along for a year or two.

Of the gentlemen signing the accompanying document, Mr. F. E. Searle was at that time cashier of the German American Bank of St. Cloud.

LONG DISTANCE TRANSMISSION AT 10,000 VOLTS*—II.

(The Pomona Plant.)

BY GEORGE HERBERT WINSLOW.

The power house is 66 ft. long by 30 ft. wide. and has walls 12½ ft. high. The walls, which are of concrete, were all built by tamping concrete in a space between temporary wooden walls forming a mold, a few feet of wall being built at a time, and the planks then loosened and raised to the height of the next section, the walls being thus made at the least expense for timber. The best English Portland cement was used. The walls were consolidated and cement saved by the use of well-washed fragments of rock imbedded in the concrete. In order to obtain the greatest available fall the power house was placed as far as possible below the level of the fall. This necessitated blasting into the side of the hill so far that the entire wall next the hill was below the level of the adjoining rock.

The station was built to accommodate four 120 K. W. 7,200 alternation, 12-pole, single-phase Westinghouse alternators with their full complements of raising-transformers and switchboard apparatus, and two exciters. The first installation consisted of one generator with one 90 ampere 125 volt "I" exciter, capable of exciting the four alternators, and of 240 K. W. capacity of oil transformers in 40 units of 6 K. W., 21 of these being located at the power house.

Several different methods of connecting the raising and lowering transformers were given careful consideration, the test of actual use favoring a series connection for both primary and secondary coils of both sets of transformers, a plan which had proved to be thoroughly reliable in its practical operation at the Westinghouse plant at Portland, Ore. It was however decided, in order to be able to change the initial pressure on the line in case of accident to any of the transformers, to connect the primary coils of the raising transformers in multiple to the dynamo, put the line coils all in series with the line and with a similar set of coils in the lowering transformers, and connect the other coils of the latter in multiple to the distributing circuits.

---

*A paper presented at the Twelfth General Meeting of the American Institute of Electrical Engineers, Niagara Falls, June 27, 1895.

The next question was what size of transformers should be used. Many small transformers meant less cost per unit for repairs, greater facility of handling, and greater flexibility in case it were desired to change the voltage on the line. Their use, however, also meant greater first cost, more complication, and somewhat lower efficiency, but these points were outweighed by the former, and a transformer unit of 6 K. W. was chosen. Each transformer is contained in a cast-iron box provided with vertical outside ribs, which serve to stiffen it and also to cool the oil with which the box is filled and which entirely covers the transformer. The box is covered by a cast-iron lid, which has conducting and radiating ribs both outside and in, the inner ones dipping into the oil at its hottest part and helping to cool it. The oil when heated rises through open spaces around the coils and spreads out in all directions, guided by the ribs on the lids, and sinks slowly down between the core and the sides of the box, thus having ample opportunity to become cooled. Each box is provided with a pet-cock, at the bottom, by which to draw off the bottom layer of oil should it become too thick by evaporation. It also has an oil gauge to show whether the tops of the coils are completely covered without having to raise the lid. The boxes are supported upon a substantial timber frame, upon the top of which two iron bands serve incidentally to protect the wood, but chiefly to metallically connect the boxes to each other and to the earth, in order to dissipate the static charge received by the boxes, which is very unpleasant. The core of the transformer is connected to the box by a copper strip fastened around a block of wood upon which the core rests in the box. To provide against the danger which would result from accidental connection between the primary and secondary coils, an insulated sheet of copper is placed between the latter and close to the dynamo-coil, and is connected to the core by a tongue which is stuck between the plates.

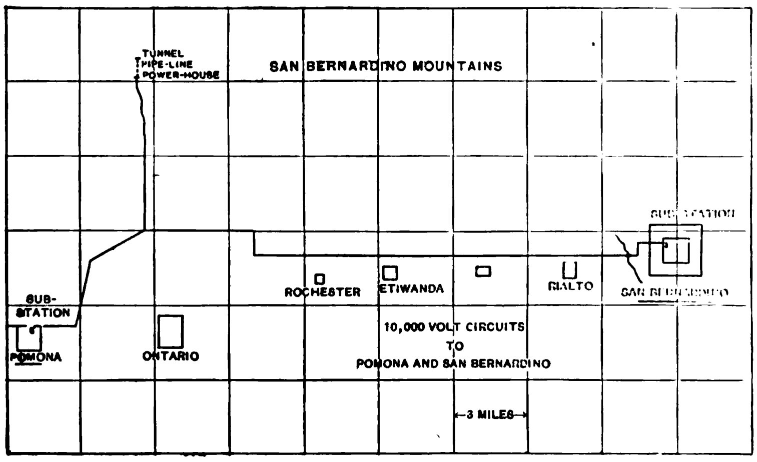


FIG. 4.—ROUTE OF LINES.

The line-coil, of No. 7 B. & S. gauge wire, is inside the dynamo-coil, and is kept everywhere at a distance of one-half inch from the latter, the ground plate and the core by walnut blocks boiled in paraffin, between which ample openings are left for circulation of the oil. The ratio of transformation is 1,000 to 450, so that in a bank of 20 transformers the dynamo pressure required for 10,000 volts on open circuit is 1,110 volts, and on full load about 3 per cent. more than this, or 1,140 volts. The space between the 1,000-volt coil and the core is one-eighth of an inch. The terminals of the line-coils are brought up through the oil in mica fiber tubes passing through heavy glass bushings held in paraffined wooden blocks which are attached to the sides of the boxes. The 1,000-volt terminals are similarly supported, but without glass bushings. The transformers are all connected in multiple to the dynamo-circuit, which is supported directly above them on a light pine framework which also supports the fuse blocks. The latter are single-pole, and the fuse passes through a hole in a marble block, the object of so confining the arc being to blow it out by its own force. Only one fuse is used on each transformer. The secondary or line coils are all connected in series by U-shaped insulated wire connections which may be readily detached when making periodical tests for insulation of terminals, and which are entirely independent of the framework supporting the dynamo circuit. Accidental contact with the exposed connectors is prevented by the framework above mentioned, and there is an inflexible rule that the high tension side of the transformers shall not be touched under any circumstances whatever while the dynamo is running.

Clark's insulation is used on all wires connected to the transformers and to the dynamo, and the terminal wires of the full bank, which must often be disconnected for testing, are further insulated by heavy glass tubes at points where they might come in contact with other wires. All other transformer wires are supported upon double petticoat glass insulators and all dynamo wires upon porcelain knobs.

The switchboard is of narrow redwood boards, tongued, grooved and beaded, nailed on a framework of yellow pine, the latter supported on porcelain insulators to keep it dry. The switchboard outfit for one generator and one exciter consists of two 120 ampere fuse blocks, an A. C. field rheostat with a 25 ampere D. P. field switch with fuses, an exciter rheostat, one 150 ampere ammeter and a 200 ampere D. P. jawswitch. From this switch the current passes to two 4-dynamo marble switch-panels which are connected in multiple to the dynamo, and are each provided with two pairs of contact plugs. By means of these panels and of two 200 ampere dynamo changing switches below them, any feeder can be operated from any dynamo which is connected to the switch-panels. Between each panel and its switch is a pair of 65 ampere Wurts shunt-wire fuse-blocks, each provided with an extra fuse and shunt which can be connected by inserting a plug should it be desired to double the fuses during the run on account of overload or of weakness in the fuse. The remaining instruments on each feeder are a voltmeter, a No. 1 switchboard converter and a 150 ampere type "E" compensator. When both feeders were run from one alternator, one voltmeter was connected to the generator and the other to the feeder, and in this way the amount of compensation could be watched.

The oil-transformers were tested before shipment with 20,000 volts between the line-coil and the core and were then taken out of the oil and boxed. In order to expel any moisture which might have been absorbed by the insulation of the coils or have condensed on the cores during their long journey, the transformers were connected in two banks of ten each, the line-coils of each set being connected in series to the generator, which was run at a reduced speed, and the secondary coils each short circuited on itself. The coils were thus gradually heated to a point somewhat above the boiling point of water, which at that elevation was about 201 degs. F. They were kept at this temperature for a short time and then paraffin oil of a special grade ("Diamond") was poured slowly into the boxes at the edges so that the coils would begin to absorb oil at their lower ends, and thus drive upward the air and volatile gases occluded by the insulation. The transformers were then again brought to their former temperature, which caused expansion and partial expulsion of the air remaining in the insulation. Some of the air would, however, collect under the insulation at the top of the coils, and had to be freed by mechanical agitation, produced by stirring the folds of insulation, or by pounding on the boxes. The heat caused volatilization of some of the lighter elements of the oil, these coming to the surface as bubbles, just as the air did at first, and the agitation was kept up at intervals until bubbles from this cause also were entirely eliminated.

The twenty transformers were then connected as they would be when in regular use, and the two terminals of the line-coils, which were to give 10,000 volts, were connected in series with one hundred 100-volt lamps, which were then brought to full candle power, showing that the transformers were all in good condition. A similar test was then made at Pomona at the end of the 14-mile transmission line running to that place; after which the transformers there were prepared for work in the same way as at the power-house, except that the grouping and initial voltage were changed.

There are two transmission lines, one 13¾ miles long, which supplies Pomona, and another, 28¾ miles long, which supplies San Bernardino. Each line consists of two No. 7 B. & S. gauge hard-drawn copper wires. The joints in the wire are made with McIntire connectors. To further improve the joint the ends of the wires were bent back side by side and soldered together. After the Pomona line was completed and the first ten miles of the San Bernardino line was put up, the supply of connectors ran out, and the regular telegraph joint was substituted. The conductivity was assured by soldering as before.

The wires are supported upon large double-petticoat flint-glass insulators designed for this plant. These insulators are of perfectly clear flint-glass, which gives a better surface-insulation than is attainable with any other kind of glass.

It was at first proposed to use oil-insulators. The reason they were not used was because the glass companies which had undertaken to furnish them found on trial that they could not make them without considerable experimenting, which would have delayed the installation of the plant. This was no doubt fortunate, as the country through which the line passes is subjected to hot, dry winds which not only blow dust onto the insulators, but also inside them, and during the day the sun beats on the insulators until they become so hot that they nearly blister one's hands. If oil were used under these conditions it would soon evaporate and thicken, and become filled with dust. It would therefore seem undesirable to have used oil insulators in this case, or to use them in any other until an increased voltage makes them necessary and the transmission of greater amounts of energy over the circuits justifies the additional expense necessary to keep the insulators in good condition.

The two circuits are carried on the same pole line for 7½ miles. (See Fig. 4.) The inside pair of pins was used for the circuit to Pomona and the outside pair for that to San Bernardino, until after the acceptance of the plant, but in anticipation of the installation of another generator the Pomona circuit was changed to the right-hand pair of pins, and the San Bernardino circuit to the left hand pair, to avoid the fluctuation in lights which would result from inductive interference between two independent circuits.

(To be continued.)

TO PERFECT ELECTRIC LOCOMOTIVES.

The successful use of electricity as a motive power on steam roads has led the Baldwin Locomotive Works and the Westinghouse Electric and Manufacturing Company to effect one of the most important combinations yet made in electrical railway affairs. Conferences have been going on between the two companies for the past two or three months which have resulted in an agreement by which they will hereafter work together in the development of apparatus for the operation of railroads by electricity. It is expected that the union of talent and manufacturing facilities of these two companies will result in the early introduction of improved forms of electric motors for standard railroads.

The news of a working arrangement between the Westinghouse Electric and Manufacturing Company and the Baldwin Locomotive Works is confirmed as we go to press.

It looks like a good trade for both the interested parties, and ought to be of some benefit to the public at large. Notwithstanding the boasts which have been made, we have, so far, no satisfactory elèctric locomotive for either heavy traction work or for rapid transit on trunk lines. The combined talent of the two companies above mentioned working in harmony will, no doubt, hasten the solution of the problem—and it is a serious problem.

American Electro-Therapeutic Association.

The above-named Association will hold its fifth annual meeting at "The College of Physicians and Surgeons of Ontario," in Toronto, Can., on Tuesday, Wednesday and Thursday, September 3d, 4th and 5th, 1895.

General News.

What is Going on in the Electrical World.

St. Ignace, Mich.—St. Ignace will establish an incandescent electric light plant.

Unointown, Ala.—A stock company is being organized here to put in an electric light plant.

Avoca, Pa.—An election is to be held to vote on the question of lighting the town with electricity.

Columbia, Mo.—Col. E. C. Moore has secured a franchise for an electric street railway in Columbia

Red Bank, N. J.—The Gillette Electric Bell Factory has been sold at sheriff's sale to O. E. Davies for $3,875.

Shelburne Falls, Vt.—The residents of this place are agitating the question of building a new electric lighting system.

Rutherford, N. J.—W. H. McKay & Co. have made application to the council for permission to build an electric railway through Rutherford.

Charleston, W. Va.—It is reported that a New York syndicate is planning to utilize power from the Kanawha Falls for electric light and power.

Bardstown, Ky.—The corporation desires bids for installing an electric light plant until August 10. Address Record Printing Company for particulars.

Lancaster, Pa.—The Columbia, Mt. Joy and Ironville Electric Railroad Company will proceed at once to construct their line between Columbia and Mt. Joy.

Spokane, Wash.—The board of commissioners of Spokane County has about decided that the county will put in the plant for lighting the court house by electricity.

Knoxville, Tenn.—It is reported that the East Tennessee Telephone Company is contemplating the erection of an electric lighting plant to furnish arc and incandescent lights for this city.

Norfolk, Va.—It is reported that the Norfolk, Albemarle and Atlantic Company is contemplating the changing of its line to standard gauge, to be operated by electricity.

Toledo, O.—Bids will be received until August 19 for the installation of an electric lighting system in the Lucas County court house. Charles H. Jones is county auditor and can be addressed.

Herkimer, N. Y.—The new Herkimer, Mohawk, Ilion and Frankfort Railway (trolley), was opened for traffic last week. The first cars over the line were greeted with enthusiasm at all points.

Long Island City, N. Y.—A new syndicate has been organized, to be known as the Long Island City Heights Association, to build a street railway up Thompson avenue to the Hunter's Point ferries.

Springfield, Mass.—At the annual meeting of the United Electric Light Company, held on the 26th ult., the directors were authorized to build a new power house at Indian Orchard at a cost of about $150,000.

Scoharie, N. Y.—The promoters of the proposed electric railroad from Albany to Scoharie have appointed a committee to visit the various towns along the line for the purpose of getting subscriptions to the stock.

Montpelier, O.—We are advised by Mr. H. H. Humphrey, electrical engineer, Detroit, that proposals will be received until August 15, by D. Stauffer, mayor of Montpelier, for an electric light and steam plant.

Greenbush, N. Y.—The Albany, Greenbush and Bath Railway Company, a recent organization, has asked the trustees of Greenbush for a street franchise. The board of trustees will give a hearing to the company on August 15.

Niagara Falls.—A test of the second of the big dynamos has been made, with the same result as that of the first—a great success in the fullest sense of the term. The distribution of power to local consumers will begin, it is said, in about two weeks.

Canton, O.—The company to build the electric road to Cleveland has been quietly organized with the following incorporators: Wm. Hoover, New Berlin; Lew Smith, Greentown; Milo White, Springfield; W. H Nees, Uniontown. The road will connect with the Cuyahoga Falls route at Akron.

Tehuacana, Tex.—Charles R. Pengilly, of Mexia, Limestone County, Tex., has received many encouraging assurances of aid in his scheme for an electric road between this place and Mexia. The distance is six miles, and the cost of putting the plant and road in operation is estimated at $25,000.

New Albany, Ind.—The Highland electric railway plant at New Albany has been sold at commissioner's sale, and purchased for $20,000 by the trustee representing the bondholders. The judgment against the road is for $55,000, besides which there are $15,000 of second mortgage bonds.

Sacramento, Cal.—Arrangements are being made here for an "Electric Carnival" on the 9th of September—Admission Day. The Power Company has agreed to furnish electricity free of cost, but the citizens will have to supply the wires and lamps. It is estimated that $20,000 will be needed for the electrical display.

Tiffin, O.—After several attempts on set days to sell the Tiffin Street Railway and the Tiffin Electric Railway and appurtenances at auction, the sheriff succeeded in disposing of them on the 29th ult. The Tiffin Electric Railway was purchased by Samuel B. Sneath for $20,000 and the Tiffin Street Railway by Joseph Loudenslager, Jr., for $4,010.

Fayetteville, N. Y.—The Suburban Railroad Company of Syracuse have been granted a franchise to run their road through this town. Manlius has already acted favorably on a similar application, and the citizens of both villages are jubilant over the prospect of rapid transit to Syracuse.

Haverhill, Mass.—It seems probable now that the electric road between Haverhill and Danvers will be built. One of the best known and most solid street railway syndicates operating in New England are willing to put in the necessary funds to take almost all of the capital stock, and two or three Haverhill parties will take blocks of stock of a greater or less size.

Painesville, O.—The Lake County commissioners have revoked their former resolution granting a franchise over the county highway from Painesville to the Cuyahoga County line to the Cleveland and Painesville Electric Street Railway Company, and decided to give the franchise to the Cleveland, Painesville and Eastern Street Railroad Company, providing terms can be agreed upon.

Jacksonville, Fla.—It is stated that an electric railroad from Jacksonville to St. Augustine will be in operation by January 1, 1896. The road will be constructed by the Jacksonville and Tampa Bay Improved Railway Company. The company has secured the passage of an ordinance by the city council of St. Augustine giving it the right to construct and operate a street railroad through the streets of that city.

Athol, Mass.—The Athol and Orange electric road has passed into the hands of new owners, namely, W. D. Luey, George D. Bates, W. D. Smith and H. M. Slate, of Athol; John W. Wheeler and W. M. King, of Orange, and Mr. Ferguson, one of the original owners. The new company has organized as follows: President, Mr. Ferguson; clerk and treasurer, W D. Luey, of Athol; directors, the seven owners.

Stoneham, Mass.—It seems certain now that the new Mystic Valley electric railway, from Stoneham to Arlington, will be built. The capital stock is to be raised to $65,000. The board of directors will probably consist of Hon. Onslow Gilmore, of Stoneham, William Bassett, of Arlington, Edward F. Johnson, of Woburn, Arthur E. Whitney, George S. Littlefield, Edwin K. Blakie and Abram Coffin, of Winchester.

Batavia, N. Y.—The project of building the Beecher single-rail railway which was to run from Oak Orchard to Batavia has been abandoned. A few hundred yards of the line was constructed and operated successfully. Financial aid was slow to materialize and its inventor became discouraged and quit the field.—C. W. Archer, J. Amstice, and Frank Westcott of this city have applied for a franchise to light the streets of the city.

Pittsburg, Pa.—The West Side Belt Line Railroad Company have received their charter from Harrisburg and are having the route surveyed. The road is to connect the Saw Mill Run Railroad with Monongahela City. It will be 20 miles long, shortening the distance between Pittsburg and Monongahela City by 12 miles. The main purpose is to tap the rich undeveloped coal fields in the second range of hills back from the Monongahela River. John S. Scully is the principal stockholder.

Milwaukee, Wis.—The *Sentinel* states that as a result of a conference between Henry C. Payne and a committee representing the people of South Milwaukee, Cudahy and the town of Lake, the Milwaukee Street Railway Company will build the line to Cudahy and South Milwaukee. Congressman McGann, of Chicago, and his associates have been endeavoring to get a franchise for a road to those places.

Stevens Point, Wis.—The Stevens Point Lighting Company, Gas Company, Water Company and Electric Railroad Company, and the Clark Water Power Company have consolidated, and the motive power of all the interested concerns will be derived from the Owen Clark dam on the Wisconsin River in this city. The capital stock is said to be about $200,000, and articles of incorporation under a new name will be filed at Madison soon.

Brainerd, Minn.—C. N. Parker, owner of the Brainerd street railway and president of the board of trade, has associated with himself E. C. Gibson, of Chicago, in a scheme to consolidate the Brainerd electric railway, the water power, telephone system and the electric lighting plant into one company, to be known as the Brainerd Public Works Company. The city owns the electric light plant, and the council has Mr. Parker's offer to purchase it under advisement.

"In the Adirondack Mountains."

Persons contemplating a visit to the Adirondack Mountains should by all means possess themselves of a copy of the delightful little book, just issued by the New York Central, bearing the above title. It will not take long to read, for it contains only [illegible]4 pages, but every page bristles with information of just the practical kind one wants at such a time. You can take this book and in half an hour secure a good idea of the Adirondack region—its grand divisions, characteristic of each, the location of the principal resorts and how to reach them.

Not the least valuable feature is a fine new relief map, printed in four colors, showing the correct location of all the principal mountains, lakes and streams; also all stage lines, wagon roads and carries, and on the back a complete list of hotels, cottages and camps—location, dates of opening and closing, rates, etc.

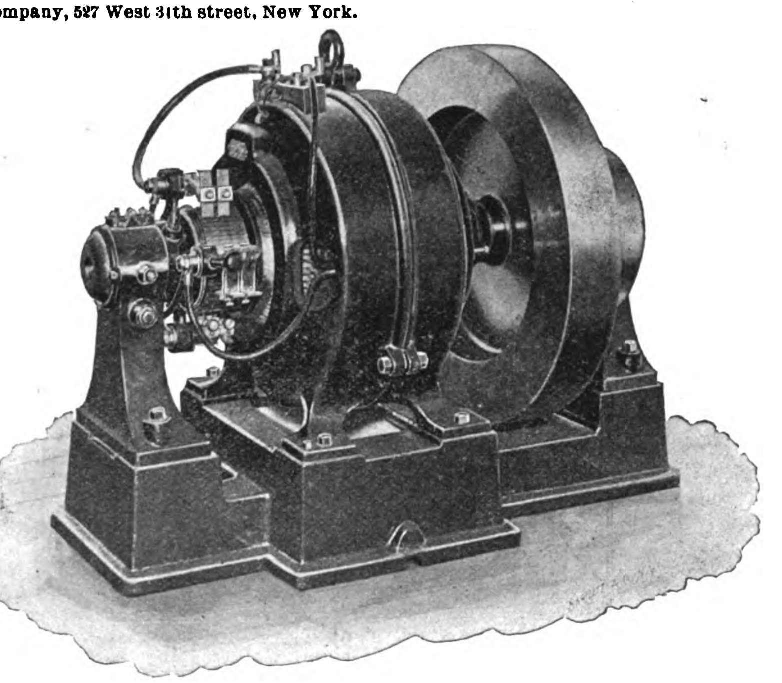
There is, probably, no other book published on the Adirondacks containing in such compact and readable shape so much useful information.

A copy will be sent free, postpaid, to any address in the world, on receipt of two 2-cent stamps, by George H. Daniels, General Passenger Agent, Grand Central Station, New York.

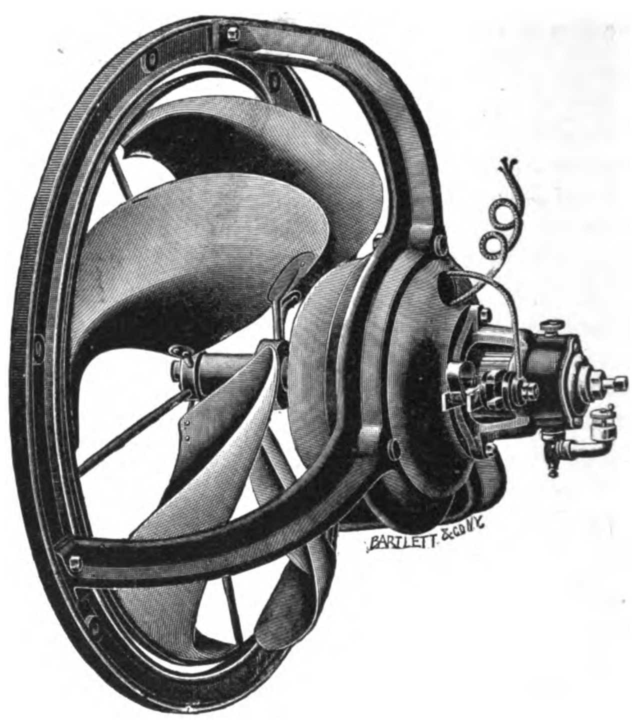
The Little Giant Phenomenal Feed-Water Heater and Purifier is a steam plant accessory recently put on the market by Braucher Bros., Danville, Ill., the inventors and patentees of the device. The heater operates on the same principle as the artificial ice machine, extracting the heat from the fuel by forcing the water to evaporate in contact with the boiler plates. It is fully described in a pamphlet just issued.

New Lundell Apparatus.

In the accompanying illustrations are shown two new forms of the well-known Lundell apparatus recently placed on the market by the Interior Conduit and Insulation Company, 527 West 31th street, New York.



Cut No. 1—Lundell Generator for Gas Engine Service.



Cut No. 2—Lundell Exhaust Fan Outfit.

In Cut No. 1 is shown the Lundell Generator for Gas Engine Service. Notwithstanding great improvements have recently been made in gas engines, absolute uniformity of speed has not yet been attained in engines above 5 H. P. Failure to overcome this defect has alone prevented a more extended use of gas engines for electric purposes.

In the new Lundell generator the slight inherent irregularities of the gas engine are compensated by a fly-wheel of heavy rim weight, thereby maintaining uniform incandescence of lamps in such a plant.

This generator is a modification of the isolated type, and is provided with heavy shaft, self-aligning and self-oiling bearings. The efficiency is from [illegible]6 per cent. for small machines to 95 per cent. for the largest. They are made in sizes ranging from 4.5 to 8.5 kilowatts.

Cut No. 2 shows a type of Exhaust Fan which possesses marked improvements over many forms now in use. The bearings supporting the fan shaft are but two in number and are placed in the motor frame itself. The practice heretofore has been to place a bearing in front of the fan, in the fan ring, as well as back of the fan. Doing away with the front bearing insures perfect alignment and noiseless running of the shaft.

These fan outfits are made in sizes from one-fourth to fifteen horse-power and with horizontal shafts, unless otherwise ordered, and are invariably made so that the direction of the flow of air is from the motor toward the fan. In all horizontal shaft fans lubrication is effected by oil. In vertical shaft fans lubrication is effected in an oil receptacle enclosing a step at the bottom of the shaft, and a graphite or other self-lubricating bearing at the upper end of the shaft.

BUSINESS HINTS.

Public Buildings, Theaters, Residences, &c., Proposed or in Course of Construction.

[The following summary is prepared weekly for ELECTRICITY for the information of advertisers and readers who are dealers in apparatus and articles required in the electrical equipment of public and private buildings.]

Atlanta Ga.—Architects Bruce & Moran are preparing plans for a ten story fire-proof office building for Wm. Ostell; all modern improvements will be introduced.

Atlantic City, N. J.—It is reported that a syndicate has been organized for the purpose of building a five story brick hotel building to cost about $1,[illegible]00,000; every modern improvement will be introduced, including electric elevators, a roof garden, etc. Wm. ingerly and Edward H. Flood are among those interested.

Baltimore, Md.—Architect Charles E. Cassell is preparing plans for a ten story apartment house at Mt. Vernon Place, Cathedral st.; the structure will be provided with every modern improvement....The Mt. Royal station, which is to be built by the Baltimore and Ohio Railroad Co., on Bolton lot, is to be lighted throughout with electricity.

Boston, Mass.—An eight story apartment house is to be erected on Massachusetts ave. for Washington B. Thomas; the plans call for all modern improvements.... The erection of a mammoth hotel building in this city is projected; the structure is to be eleven stories in height and will cost $3,500,000.

Brooklyn, N. Y.—The city hall is to be repaired and improved at an estimated cost of $100,000....Architects Cady, Berg & See have prepared plans for four residences to be erected on Pierrepont street for Dr. Graham Tusk. The structures are to be equipped with an electric lighting system.

Columbia, Pa.—Samuel Daron has purchased a site cor. 7th st. and Alley H, and will erect 4 brick dwellings with all modern improvements.

Chicago.—A sixteen story addition is to be built to the Great Northern Hotel which will contain a theater; the structure will be equipped with the most modern improvements.

Cincinnati, O.—A new club house is to be erected by the directors of the Lincoln Club; Architect Reckart has prepared plans.

Cleveland, O.—Plans have been prepared by Major C. F. Crames for a seven story building to be erected on Huron street for the Knights of Pythias. The structure will be equipped with all modern improvements, including passenger elevators, etc.

Dallas, Tex.—The erection of a $150,000 temple is contemplated. W. W. Manning and A. V. Lane will give information.

Detroit, Mich.—W. J. Chittenden has secured a long lease of the Russell House, and will make a number of improvements, including an independent electric lighting plant.

East Orange, N. J.—Plans for a town hall will be submitted to the township committee on August 5; steam heat and electric lighting are features.

Fall River Mass.—The Young Men's Irish American Society will erect a building on Anawan street.; all modern improvements will be introduced.

Hartford, Conn.—It is reported that a new opera house is to be erected here at an estimated cost of $125,000.

Jacksonville, Fla.—An addition is to be built to the Windsor Hotel by Washington Van Hamm. Among other improvements electric lighting will be introduced.

Knoxville, Tenn.—A syndicate including Joseph H. McLear, W. M. Hood, Major Swetson and the East Tennessee National Bank, will erect an opera house opposite the Palace Hotel; estimated cost $100,000.

New Haven, Conn.—Plans have been prepared by Architect W. H. Allen for a five story theater and office building to be erected on Church st. for Manager Poli.

New Orleans, La.—Architects Shepley, Routan & Coolidge, of St. Louis, have prepared plans for the Pickwick Club House, to be erected in this city; the building will be provided with every modern improvement.

New York City. Wm. Broadbelt, 403 West 148th st., will erect a seven story and basement brick store and lofts at 241 and 243 West 23d st.... James L. Libby & Son, 69 Liberty st., have leased the property at 5-9 Union Square and 20 East 15th st., and will commence the erection of an eight story fire-proof building....It is reported that an eight story office building is to be erected at Pearl st. and Burling Slip by the New York Metal Exchange..... P. M. Stewart, 562 West End ave., will build 2 four story and basement dwellings on south side of 76th st., west of West End ave....John D. Crimmins has purchased ground bounded by 143d and 144th sts., Lenox and 7th aves., on which model apartment houses will be built....Eugene Schieffelin will build a private residence on north side of 76th st., east of 5th ave.; Architects Parrish & Schroeder Madison ave....Wm. H. Bingham will build 2 five story apartment houses, north side of 119th st., west of Park ave.; Architects Neville & Bagge, 215 West 12[illegible]th st.... John McLaughlin, 346 East 81st st., will build 2 five story brick flats, south side of 9[illegible]th st., west of 1st ave.; Architect John Hauser, 1441 3d ave....Architects Clinton & Russell, 32 Nassau st., have completed plans for 5 American basement houses, to be erected on [illegible]5th st., west of 5th ave.; lighted by gas and electricity....Charles H. Bailey, 102 East 108d st., will erect a five story flat, north side of 111th st., west of [illegible]th ave....Architect George F. Pelham has prepared plans for a row of five story stone apartment houses to be erected at 1 6th st. and 7th ave. for Giblin & Taylor....Plans have been prepared for a new sixteen story office building at 5 to 11 Broadway; estimated cost $1,800,000....A seven story brick store and loft building is to be erected for Thomas B. Keogh at 40 Great Jones st.; Architect E. G. Dollner....Plans have been prepared for a new club house for the New York Athletic Club at 59th st. and 6th ave.; the structure will be 9 stories in height and the cost is estimated at $150 000.... Joseph L. Buttenweiser, 26 Pine st., will erect a seven story flat and store building at 39 Great Jones st....B. M. Stiger, 323 State st., will build a four story brick dwelling at 319 West 74th st. to cost $[illegible]8,000....Norman J. Murray, 101 Willow st., Brooklyn, will build a four story brick dwelling, north side of 74th street, east of Riverside Drive....Asa Hull, 209 West End ave., will build a four story brick dwelling, Riverside Drive, north of 75th st.... John T. and James Farley of the Nevada apartment house will build 2 four story brick dwellings on south side of 72d st., east of Columbus ave; Architects Thom & Wilson, 1[illegible]67 Broadway....W. C. Adams, 74th st. and West End ave., will erect a five story brick dwelling, north side of 74th st., east of Riverside Drive; Architect P. H. Gilbert, 18 Broadway....Florence L. De Baum will erect a three story brick dwelling at 28 West 45th st; Architect W. H. Miller....A four story brick and stone stable is to be erected for P. H. McManus, at a cost of $60,000, after plans prepared by H. H. Carter; elevators, steam heating, electric lighting, etc., will be introduced.

Owensboro, Ky.—A new Y. M. C. A. building is to be erected here at a cost of $30,000. Specifications call for latest improvements.

Paoli, Ind.—The Paoli Mineral Springs Co. propose to erect a new hotel here, and will put in an electric plant to supply the hotel and town.

Philadelphia, Pa.—A ten story addition is to be built to the Aldene, at a cost of $225,000.

Scranton, Pa.—Work will soon be commenced on the erection of the new building for the Traders' National Bank.

Sedalia, Mo.—A four story brick and stone hotel building is to be erected by B. G. Cassidy and other local capitalists; estimated cost, $200,000; all modern improvements will be introduced.

St. Louis, Mo.—An addition is to be built to the Turner Hall of the South St. Louis Gymnastic Society; among the improvements will be electric lighting.

Tacoma, Wash.—Plans have been prepared for a four story business building for C. A. Darmer; elevators, electric lighting and other improvements will be introduced.

Westfield, N. J.—Plans are being prepared for the erection of a three story building for the Young Men's Christian Association on Elm st.; to be equipped with every modern improvement, including electric lighting, a gymnasium, etc.

INCORPORATIONS.

The Kootenai Mining and Milling Company, Spokane, Wash.—to do a mining and milling business, and deal in mineral products and electric light plants. Capital stock, $1,000,000. Promoters: L. Frank H. Gordon, Spokane, Wash.; B. E. Barinda, Wm. H. Gawkey, Detroit, Mich.; John D. Farrell, Albert E. Humphreys.

The Freeman Street Improvement Company of Orange Valley, N. J.—to improve Freeman street, Orange, and build an electric railway in that street and up the side of Orange Mountain. Capital stock, $100,000. Incorporators: Victor N. Savale, Christian H. Heckel, J. Henry Fiedler and John J. Barry, and the officers are: President, John Davis; vice-president, Franz Berg; secretary and treasurer, Robert D. Collins.

The Amber Investment Company, Tacoma, Wash.—to construct, lease and operate electric street railways and develop water and electric power, etc. Capital stock, $5,000. Incorporators: Arthur G. Prichard, Fenley Bryan, Frank G. Taylor, F. J. Miller and Robert C. Applegate.

The Wellesley and Boston Street Railway Company, Newton, Mass.—to build and operate a street railway from West Newton to Wellesley. Capital stock, $40,000. Directors, Horace B. Parker, Austin P. Mitchell, James L. Richards, J. W. French, Newtonville; George W Morse, W. F. Hammett, Newton; Frederick Johnson, Auburndale.

The Fall River Street Railway Company, Fall River, Mass. Capital stock, $50.0 0. Directors: Wendell E. Turner, Arnold B. Sanford, David Beattie, J. E. Osborn, W. F. Shove, Herbert Field, M. T. Hudner, all of Fall River.

The Albany, Greenbush and Bath Railway, Albany, N. Y.—to build and operate an electric railway in Albany and Greenbush, for passengers, express and freight. Capital stock, $150,000. Directors: Edward J. Duggan, William E. Drislane, Edward J. McCaffrey, Patrick J McArdle, Meyer S. Levy, Michael F. Cantwell, Albany; John F. Munger, East Albany; John F. Reilly, Greenbush; and Charles A. Bailey, Bath-on-the-Hudson.

The Jenkintown and Fox Chase Electric Railway Company, Philadelphia—to build and operate a street railway. Capital stock, $20,000. Incorporators: Howard Fleck, Samuel L. Schively, James Satterthwaite, Thomas B. Harper, Howard Noble, of Jenkintown, and William P. Longstreth, Fox Chase.

The Whiteside Harrison Telephone Company, Morrison, Ill. Capital stock, $6,000. Incorporators: Aaron D. Hill, Simon S. Crider and John D. Hill.

The South Bend Telephone Company, South Bend, Ind. Capital stock, $50,000. Directors: C. B. Van Pelt, Louis Nickel, Jr., W. H. Longley, E. G. Waldron, W. L. Kizer and F. W. Martin.

The National Electric Plumbing Supply Company, Cleveland, Ohio—to manufacture and deal in all kinds of plumbing and sanitary goods light and electrical machinery. Capital stock, $25,000. Promoters: T. O'Mara, Wm. H. Cleveland, Wm. J. Gleason, Geo. W. Papsworth, M. J. Kelly.

The Samuels Dynamite Accumulator Company (incorporated in West Va.), New York, N. Y.—to manufacture and sell electrical storage batteries in the United States and Canada. Capital stock, $5,000,000. Promoters: Wm. Seward Webb, Shelburne, Vt.; John Jacob Astor, Henry L. Sprague, Henry B. Ely, Charles H. Burnet, New York City.

The La Harpe Electric Light and Power Company, La Harpe, Ill.—to purchase, erect, maintain and operate an electric light and power plant in the city of La Harpe and vicinity. Capital stock, $15,000. Promoters: Joseph R. Crabill, George Coulson, W. O. Butler.

The Montpelier Telephone Company, Montpelier, Vt. Capital stock, $20,000. Promoters: J. Hayes, John Burns and W. N. Pay, all of Montpelier.

The Dan River Power and Electric Company, Danville Va. Capital stock, $7[illegible]0,000. President, Thomas B. Fitzgerald; vice-president, William P. Bethel; secretary and treasurer, R. A. James; directors: Frank X. Burton, John H. Schoolfield, James E. Schoolfield and R. Addison Schoolfield.

The Hillsboro Electric Street Railway Company, Hillsboro, Hill County, Texas—to build and operate an electric railway. The officers are J. H. Graham, of Boston, president; H. W. Carter, Hillsboro, vice-president; J. T. Voss, Atlanta, Ga., superintendent; R. J. Ware, Hillsboro, secretary and treasurer. The officers, with S. E. Carter and S. F. Sullenberger, constitute the directors.

The Watertown Telephone Exchange Company—to maintain lines through Watertown and the towns and villages in Jefferson County, N. Y. Capital stock, $50,000. Directors: A. L. McCrea, Jr., and J. R. McIntyre, of Gouverneur, and John C. Streeter, Samuel Felt. George C. McMullin, James L. Newton and Francis A. Sherman, of Watertown, N. Y.

The Little Falls and Richfield Springs Railway, and the Richfield Springs and Schuyler Lake Railway companies, the former to build an electric road 18 miles long, and the latter one a mile long, have been incorporated at Albany. The Little Falls and Richfield Springs Railway has a capital of $200,000, and the Richfield Springs and Schuyler Lake Railway a capital of $2[illegible],000. The boards of directors of the two companies are identical, comprising Caleb L. B. Tylee, Frank H. Viele, George E. Tylee, Edwin J. Carpenter, John L. Miller and Thomas J. Mack, of Corning; Theodore C. Bates and William H. Tylee, of Worcester, Mass., and H. Arthur Sillsbee, of New Bedford, Mass.

The Dunmore Electric Street Railway Company, Dunmore, Pa.—to build and operate an electric street railway in Dunmore. Capital stock, $7[illegible],000. Promoters: P. J. Horan, T. E. Boland, Dunmore; I. H. Burns, Scranton, Pa.

The Sycamore Light and Power Company, Sycamore, Ill.—to produce and dispose of light, heat and power for public and private use, and manufacture all appliances for such purposes. Capital stock, $30,000. Promoters: Frank C. Patten, Carrie C. Patten, Thomas L. Halloran.

The Wilkinsburg and Rankin Street Railway Company, Pittsburg, Pa.—to build and operate an electric street railway. Capital stock, $24,000. Promoters: Albert L. Schultz, John W. Taylor, Pittsburg; S. L. Tone, Rochester, Pa.

The Munhall Street Railway Company, Pittsburg, Pa.—to build an electric street railway. Capital stock $3,000. Promoters: Albert L. Schultz, John W. Taylor, Pittsburg; S. L. Tone, Rochester, Pa.

The Rankin Street Railway Company, Pittsburg, Pa.—to build an electric street railway. Capital stock $3,000. Promoters: A. L. Schultz, Sam P. Whit n, S. L. Tone, John W. Taylor.

The Citizens' Telephone and Electric Company, Hoboken, N. J.—to construct, operate and maintain telephone and electric service lines in the county of Hudson, and for the transmission of light, heat and power. Capital stock, $50,000. Promoters: Wm. H. Elles, John Ryan, John J. Cuddiley, Hoboken, N. J.; Morris Frankford, New York City.

The La Porte City Electric Light and Water Company, La Porte City, Iowa—to build, maintain and control systems of electric light and waterworks. Capital stock $15,000. Promoters: W. D. Wagoner, E. Duke Naven, A. Van Valkenburg, J. C. Graham, A. L. Waker, La Porte City.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED JULY 30, 1895.

ELECTRIC RAILWAYS AND APPLIANCES.

543,529. Electric Trolley. George W. Hooper, Rochester, N. Y., assignor to James S. Baker, same place. Filed Sept. 11, 1894.

543,544. Electric-Car Brake. George B. Damon, Lowell, Mass., assignor of one-half to Gardner W. Pearson, same place. Filed April 9, 1894.

ELECTRIC LIGHTS AND APPLIANCES.

543,502. Electric-Arc Lamp. Samuel E. Nutting, Chicago, Ill., assignor to George W. Furbeck and Joseph Kettlestrings, same place. Filed April 5, 1894.

543,6 6. Internal Illuminator and Probe. Willard E. Dow, Braintree, Mass. Filed Feb. 16, 1895.

543,729. Electric-Arc Lamp. Charles F. Hartmann, Lynn, Mass., assignor, by mesne assignments, to the General Electric Company, Schenectady, N. Y. Filed Nov. 21, 1894.

DYNAMO ELECTRIC MACHINERY.

543,52[illegible]. Starting or Stopping Device for Electric Motors. Jonathan P. B. Fiske, Alliance, Ohio. Filed Nov. 14, 1894.

543,524. Device for Automatically Operating Brakes and Rheostats. Jonathan P. B. Fiske, Alliance, Ohio. Filed Dec. 6, 1894.

543,525. Electric Motor and Brake Mechanism Therefor. Jonathan P. B. Fiske, Alliance, Ohio. Filed Feb. 9, 1895.

543,557. Overhead Traveling Crane. Thomas R. Morgan, Sr., Alliance, Ohio, assignor of three-fourths to Thomas R. Morgan, Jr., John R Morgan and William H. Morgan, same place. Filed Sept. 10, 1894.

543,670. Four-Motor Reversing-Switch. Frank E. Case, Schenectady, N. Y., assignor to the General Electric Company of New York. Filed May 15, 1895.

TELEPHONE AND TELEGRAPH APPARATUS.

543,490. Contrivance for Disinfecting Telephone Apparatus. Rudolph Lamarche, Hamburg, Germany. Filed July 21, 1894.

543,559. Signaling Apparatus for Telephone Exchange Circuits. Joseph J. O'Connell, Chicago, Ill., assignor to the American Bell Telephone Company, Boston, Mass. Filed May 14, 1895.

543,626. Transmitting and Receiving Attachment for Telephones. Hosea W. Bibbey, Boston, Mass. Filed Oct. 9, 1894.

543,708. Telephone-Exchange. Wada Y. Shibata, San Francisco, Cal. Filed Nov. 24, 1 93.

543,798. Telephone. Norval L. Burchell, Washington, D. C. Filed Oct. 29, 1894.

BATTERIES.

543,480. Secondary Voltaic Battery. Ludwig Epstein, London, England. Filed Jan. 5, 1895.

SIGNALS AND SIGNALING APPARATUS.

543,591. Railway Signaling System. Thomas B. Dixon, Henderson, Ky. Filed Nov. 17, 1892.

543,592. Electrical Railway Signaling System. Thomas B. Dixon, Henderson, Ky. Filed Oct. 5, 1893.

543,594. Electrical Railway Signaling System. Thomas B Dixon, Henderson, Ky. Filed July 10, 1894.

543,595. Electrical Railway Signaling System. Thomas B. Dixon, Henderson, Ky. Filed Aug. 20, 1894.

4 ,596. Electrical Railway Signaling System. Thomas B. Dixon, Henderson, Ky. Filed Aug. 20, 1894.

543,721. Signaling on Railways and Means Therefor. Edwin Blakey, Bradford, assignor to the Automatic Electric Railway Signal Company, Limited, Liverpool, England. Filed June 11, 8 4.

543,7 5. Railway Signaling. Jens G. Schreuder, Edgewood Park, assignor to the Union Switch and Signal Company, Swissvale, Pa. Filed March 28, 1894.

543,793. Switch and Signal Mechanism. John V. Young, Boston, Mass., assignor to the Union Switch and Signal Company, Swissvale, Pa. Filed Aug. 29, 18 4.

MISCELLANEOUS.

543, 9[illegible]. Electrical Controlling System for Elevators. Cyprien O. Mailloux, New York, N. Y. Filed May 28, 1895.

543,564. Reactive Coil. Edgar E. Stark, New York, N. Y., assignor to Sigmund Bergman, same place. Filed Feb. 21, 1894.

543,613. Manhole for Underground Conduits. James F. Cummings, Detroit, Mich., assignor to the Cummings & Engelmen Conduit Company, same place. Filed Nov. 6, 18 4.

543,625. Machine for Boring Joists for Electric-Light Wiring, John G. Henderson and Robert H. Henderson, Chicago, Ill. Filed Oct. 3, 1894.

543,653. Electric-Brake Shoe. William B. Potter, Schenectady, N. Y., assignor to the General Electric Company of New York. Filed March 10, 1895.

543,65 . Electric Soldering-Iron. Frank B. Rae, Detroit, Mich., assignor to Charles L. Coffin, same place. Filed Sept. 18, 1894.

543,655. Watchman's Time-Recorder. George F Ransom, Milwaukee, Wis., assignor of one-half to Harold G. Underwood, same place. Filed Sept. 4 1894.

543,800. Electric Heating-Rug. Jesse R. Davis, Parkersburg, W. Va., assignor of one-third to Charles A. Wade, same place. Filed July 11, 1894.

543,821. Electrode osition of Alloy. Henry J. Altman, New York, N. Y., assignor of one-half to Max Il Fischer, same place. Filed April 12, 1894.

THE TELEPHONE WORLD.

"The Telephone Systems of the Continent of Europe."

The above is the title of a book the appearance of which at the present stage of telephone development in the United States is very timely. The author, A. R. Bennett, member Institution of Electrical Engineers, has long been identified with the telephone interests of the United Kingdom and is at present general manager and chief engineer of the New Telephone Company, London. He has long been interested in the problem of cheap telephone service in England, it having been his belief for years past that the English were paying too much for an inferior service. As general manager of the Mutual Telephone Company of Manchester, he demonstrated the possibility of giving a service superior and at least 75 per cent. cheaper than that supplied by the National Telephone Company. The Mutual Company built up a profitable business and was so successful that it was credited with having solved the problem of cheaper telephone service, but in an evil hour the directors sold out to a company which proposed to extend the fight all over England. Within a short time this company was absorbed by the National Company, and once more Manchester and other cities were in the grasp of monopoly.

To provide himself with authentic information that will enable him to continue his warfare against high rates and poor service in England, Mr. Bennett made a visit of personal inspection to the Continental countries. The book is the result of his observations It is certain that a perusal of it will convince the most doubting that the people of the United States as well as of England have been paying dividends on watered stock of monopolistic corporations rather than for a satisfactory telephone service.

The telephone systems of the Continental countries are not controlled by the corporations, but by the Governments, which aim to give the best services at the lowest rates. Mr. Bennett makes no direct argument for Government control of telephones but suggests the possibility of municipal management, which in England is not uncommon in enterprises of a public and quasi-public character. Fortunately, perhaps, neither national nor municipal control is needed to correct the abuses of telephone monopoly in the United States. The competition of the rapidly increasing independent telephone service is solving that problem to the eminent satisfaction of the telephone-using public.

Austria, Bavaria, Belgium, Bulgaria, Denmark, Finland, France, Germany, Portugal, Roumania, Russia, Spain, Sweden, Switzerland and Wurtemburg were visited by the author. He devotes considerable attention to the history and present development of the telephone service in each country, as well as to the character of service, rates, details of construction, statistics, etc., and deduces from the data gathered the observation that there are countries where the telephone is used for the benefit of the public rather than as a means of levying tribute for the support of monopolies.

The telephone tariffs of these countries are the lowest in the world. The inclusive rates, covering the supply and maintenance of wires, instruments and accessories, are £2 10s., £2 15s. 7d. and £3 6s. 8d. in Norway ; £1 15s. 7d. and £8 6s 8d. in Denmark ; £2 9s. 7d. and £2 .7s. 10d. in Holland ; £3 4s. in Finland ; £2 16s. and £3 12s. in Italy ; while rates of four pounds and five pounds are frequent elsewhere. In refutation of the assertion that low rates mean bad workmanship, the author directs special attention to the installation at Zutphen, Netherlands, a town of 17,000 inhabitants, where an inclusive rate of £1 17s. 10d. prevails. The installation is fitted with metallic circuits of bronze wire, heavier than is used in England, with the best makes of instruments, and an expensive switchboard. The line construction is of the best. An all-night service is maintained and the company pays 4.2 per cent. on the capital invested. To dispose of the assertion that low rates are applicable only to small towns, the author reproduces the report of the Christiana Telephone Company for 1893. This company, operating in the capital city of Norway, has nearly 5 000 subscribers, and has regularly paid dividends of from 5 to 5½ per cent. since 1885, besides keeping its system up to date, providing ample reserve funds, and liberally contributing to the benevolent fund of its employees, all on an inclusive rate of £4 8s. 11d. In the town of Frondhjem, Norway, the exchange is managed by the city council. The exchange is well built and provided with the Ericsson instrument, the most expensive in the market. This plant earns a profit of 4 per cent. on an inclusive rate of £2 10s. for business, and £1 5s. for private connections.

Numerous other instances of low rates are cited, all verified by statistics. Touching the question of rates, Mr. Bennett reaches the conclusion that telephony can be conducted as cheaply in England as on the Continent, and that a company having control of the English business could easily earn good dividends at half the present rates provided it did not have a watered capitalization. It is quite possible that the same would hold good in the United States.

The book is a mine of information on the subject and will prove a valuable aid to those interested in the cheapening and improvement of the telephone service.

Not Ready to Report.

The committee having in charge the details of the plan of organization of the Eastern Telephone Protective Association has not yet been able to complete its labor, owing to the absence from the city of Mr. H. T. Johnson, of the Manhattan Electrical Supply Company, who has been called away by the death of his father. Mr. Johnson is one of the moving spirits in the formation of the association, and together with Mr. A.F. Stanley, of De Veau & Co., is entitled to the credit of having originated the idea.

Telephones Supplant Messenger Boxes.

An innovation in district messenger service has been introduced at Des Moines, Ia., by C. K. Mead, of the American District Telegraph Messenger Company of that city. The messenger call boxes have been removed and telephones substituted for them, and instead of calling up by box, the telephone is now used to talk with. In addition to this branch of the service, also, a telephone has been placed in all the factories and like institutions, employing watchmen. The object is to have the watchmen report to the messenger service every hour during the night, it being so arranged that if an hour is missed without a report an officer can be dispatched at once to the establishment in which the watchman should be on hand, to discover whether he is asleep or is unable from sickness or injury to report.

Capt. A J. West, one of the promoters of the new telephone company at Atlanta, Ga , says his company will do nothing further until the overhead versus underground issue is settled between the city council and the company.

The common council of Niles, Mich., has rescinded its action allowing the Bell Telephone Company to place its poles and wires in the streets and ordered the company to take off all those which are now erected.

The Pennsylvania Telephone Company has brought suit against the Reading and Southwestern Electric Railway Company at Reading, Pa., for damages to instruments cuased by crossing of trolley with telephone wires.

The Jacksonville Telephone Company, Jacksonville, Fla., wishes estimates for telephone equipment for 400 or more subscribers to an exchange. Address the company, or W. N. Shine, Tallahassee, Fla.

The Interior Telephone Company of New York will install a working exhibit at the Atlanta Exposition.

The telephone rates in New Haven, Waterbury, Hartford and Bridgeport, Conn., have been reduced by the Southern New England Telephone Company to $10 and $4 per month for single and $6 and $3 for party wire.

The Latrobe Telephone Exchange Company has been organized at Latrobe, Pa., with a capital of $5,000. Joseph E. Barnett, of Latrobe, is president.

Mayor Clapp proposes that the conduits soon to be laid in Memphis, Tenn., be installed by the city instead of the electric companies.

The Iowa Union Telephone Company has cut its rates in Sioux City, Ia., to $1 and $2 per month. The Home Telephone Company, which has established an independent exchange of 600 subscribers, charges $2.50 and $3.

The capital stock of the Lafayette Telephone Company, Lafayette, Ind., has been increased by $45,000, making a total capital of $75,000.

The Citizens' Telephone Company has completed a large exchange at Columbus, Ind., using the Harrison system, and has reduced the rates of the Central Union Telephone Company from $36 to $12.

The Automatic Telephone Company has practically abandoned its negotiations for a franchise in Rochester, N. Y. The Standard Telephone Company, through Frederick Cook, has petitioned for a franchise in that city.

The Supreme Court of Connecticut has handed down a decision in the case of Mrs. Caroline L. Bradley of East Haven against the Southern New England Telephone Company, finding no error in the trial in the court below, which awarded $800 to Mrs. Bradley for the cutting down of two trees on her property by employees of the company.

The underground telephone system at San Antonio, Tex., has been completed.

The board of trade of Carbondale, Pa., is organizing among its members a company to accept the telephone franchise recently granted by the council of that place.

The Delaware County Telephone Company is the name of a local telephone company being organized to operate at Lansdowne, Pa., and vicinity, with connections to Philadelphia. The rates will be $ .50 and $1.50 per month. After fifty signatures are obtained to the subscription papers work will be commenced.

The contest for a telephone franchise in Detroit, Mich., which has been bitterly waged by the Brown Loud Speaking Telephone Company and the Detroit Harrison Telephone Company, has been decided by Mayor Pingree, who has vetoed the Brown Company ordinance and approved the ordinance of the Harrison Company. The rates are fixed at $25 and $40. The Harrison Company has not accepted this condition.

Grafton, W. Va., is just now in the throes of a telephone war between the Bell people and the Standard Company. The Bell people have cut the rate for business houses from $70 to $.0, and for private houses telephone may be had for $17. The Standard people charge $23 and $ 0 respectively, but promise to meet any cut the Bell people may make.

ELECTRICITY will soon publish some information in regard to the early microphone patents taken out in France by Dr. Emil Berliner which cannot fail to be of more than passing interest.

The Northwestern Electric Telephone Company is seeking a franchise at Racine, Wis.

The Gonzales Telephone Company has been organized at Gonzales, Tex., by L. P. David, A. J. Moore and others, to build a long distance system.

A company is being formed to build a telephone line between Sulligent and Vernon, Ala.

The Northwestern Telephone Company has commenced to build a telephone line from Wanconia, Ia., to Cresco, via Jackson Junction, Protervine, Decorah and Burr Oak.

An agreement has been entered into by the West Shore Telephone Company of New York State and the Standard Telephone Company, under which the plant of the former company will become the property of one of the branches of the latter and the lines of the West Shore will be completed and put in operation throughout the entire territory covered by that organization. The Standard Company assumes the indebtedness of the West Shore Company and agrees to give to each shareholder the same amount as his holding in that company of the capital stock of the Citizens' Standard Telephone Company, a new organization, capitalized at $150,000 and covering the counties of Ulster, Orange and Greene. Each stockholder is to become a subscriber to the service of the new company at $1.50 a month, the service to include all of Ulster County without extra tolls and with half the present rates for business outside the county.

The Wisconsin Telephone Company is building a new metallic circuit between Washburn, Ashland and Bayfield, Wis., a distance of thirty miles,

The Elizabeth Mutual Telephone Company, Elizabeth, N. J., has filed articles of incorporation. The stockholders are one hundred well-known citizens, including many of the leading business men, manufacturers and professional men of Elizabeth. The capital is $30,000, of which $10,000 has been subscribed. It is the intention of the company to begin at once the building of its telephone exchange.

The city council of Eureka, Ill., has granted a twenty-year franchise to the Postal Telegraph Company.

A telephone war is on in Frankfort Ind. Two months ago the Frankfort Telephone Company, composed of home capital, organized and announced that it would construct a plant and give the public service at $1.50 per month for private residences and $2.50 for offices, or, where a business man subscribed for two telephones, the rates would be $1.25 and $2.25. The Central Union Telephone, on the organization of the home company, reduced its rates to $3 and $2, with the threat that if the new company's plant was built the rate would go still lower. The home company went ahead perfecting its service until it now has 1 0 subscribers to the Central's 75. Last week the Central Union Company notified its subscribers that they would hereafter be charged but $1 and $2, with the chance of getting the service still cheaper should the Frankfort Company meet the new rate. Immediately the Frankfort Company announced a $1 and $2 rate, with the assurance that it proposes to protect itself against any reduction made by the Central Union.

ELECTRICITY.

VOL. IX. NEW YORK, AUGUST 14, 1895 No. 5

ELECTRICITY

Published every Wednesday by the

ELECTRICITY NEWSPAPER CO.

B. E. GREENE, PRES'T. L. J. MONTGOMERY, SEC'Y.

PUBLICATION OFFICE:

6 Park Place - New York

EDITORS: NELSON W. PERRY.
BURTON E. GREENE.
R. H. WILLOUGHBY.

BUSINESS MANAGER, - - JOHN L. GANS.

SUBSCRIPTION RATES:

UNITED STATES,	$2.50
IN CLUBS OF FIVE OR MORE,	$2.00
FOREIGN COUNTRIES,	$4.50
SINGLE COPIES,	10 CENTS

ADVERTISING RATES:

As ELECTRICITY reaches all classes interested in electrical work, its value as an advertising medium can be readily appreciated. Rates will be sent on application.

Changes for advertisements should reach the office not later than the Saturday preceding the date of publication.

ENTERED AT THE N. Y. POST OFFICE AS MAIL MATTER OF THE SECOND-CLASS.

EDITORIAL NOTES.

There are still left in this trade a large number of men who have entered into it for their life work. They may be disheartened, but they have not given up. It is for them that we write. To them we present our argument, and to them we must all look for the re-establishment of business principles, the reinforcement of the doctrines of common sense.

It is for these men to consider just why wrong has temporarily triumphed over right, why it was possible for the tricksters and adventurers to bring the industry to its present condition.

And when these questions receive careful thought the only answer possible is that the electrical press has not done its duty.

If the "Electrical Engineer," the "Electrical World," the "Electrical Review" and the "Western Electrician" had faithfully done their duty by the trade they claim to represent, whose best interests they claim to guard, the present situation would never have confronted us.—"ELECTRICITY," June 5, 1895.

The Braking of Trolley Cars.

Our esteemed contemporary, the *American Machinist*, comes out with a lengthy editorial on the inefficiency of the braking devices employed on trolley cars, and incidentally slurs the electrical journals for not having given, so far as it knows, any attention to this important question. It says:

"The multitude of electrical publications is now so great, so much talent is employed upon them, and so much enterprise is displayed by them, that between them all we should at least be able to get at all the important facts connected with the matters which they professedly handle. As it is their mission to disseminate knowledge, to promote investigation, to chronicle the results of investigation and experiment, and in a manner anticipate for the uninitiated the progress and development of the modern wonder, we had hoped before this to have seen something of the topic indicated by the title above. We have been waiting very patiently, and looking very longingly for some solution of the perplexing problem of how to operate the brake upon the electric car so that an electrically propelled car shall be as safe as any other so far as the stopping of it is concerned. *We have not seen that problem considered, or even enunciated by any electrical journal.* Why not? It is not to be supposed that any electrical journal is ignorant of the fact that an electrically driven car upon a street railway, a trolley car, either an overhead trolley or an underground trolley, and especially, and for an additional reason, a car operated by a storage battery, cannot either of them, with safety to itself, be stopped as quickly as any other car of the same capacity and running at the same speed."

The italics are ours. A blind man might truthfully say that he never saw the sun rise, but that certainly would not be the fault of the sun, nor is it the fault of the electrical journals that our contemporary never saw the problem of brakes considered or enunciated in the electrical journals. The subject has been a very much discussed one both by the electrical journals and by the American Institute of Electrical Engineers, and if the editor of the *American Machinist* will drop in on us, we will be pleased to turn to many pages of our paper that have been devoted to this very question. Our contemporary, however, is laboring under a very much more serious error than the one referred to above, and it is the more surprising in the *American Machinist*, because it indicates a misconception of mechanical facts with which it should certainly be conversant.

It says:

"Any mechanic must see at once that the brake, in view of the emergency that it is supposed to provide for, is a slow-acting affair, and if he will investigate the propelling mechanism of the car, he will easily see that it is, and why it is, purposely made so. The armature of an electric motor, as everybody knows, is quite a heavy part of it, and, running at a high velocity, it is, of course, a powerful fly-wheel, and when it is noticed that the armature, or the shaft which carries it, is geared to the axle without the possibility of slip the whole situation is exposed. If the axle is stopped suddenly something is going to be smashed, so the slow-acting brake is a safety device for the motor."

This is only partly the truth. The mechanical brake is a slowly-acting affair, and purposely so, but not for the reason assigned. The large angular movement of the brake handle is provided simply and solely for the purpose of mechanical advantage and not for the protection of the gearing as supposed. To produce the most effective braking, several requirements must be fulfilled. In the first place the propelling force must be cut off first, and then the retarding effort must be applied. It must be remembered, too, that suddenness of application of the brake is not always or usually a requisite to a good brake. Were this so, the blocking of the wheels would be the most efficient emergency stop. All experience has shown that this is not true, and that a car may be brought more rapidly to rest under other than skidding conditions. In fact if the wheels once begin to slide, the motorman will best throw off his brake entirely for a moment until the wheels have again attained normal rolling friction, and then apply it rather than to continue the former conditions. Were suddenness of application the sole desideratum, the electric car would have facilities not found to the same extent in other vehicles, for by simply reversing the motors the wheels would be revolved in the opposite direction. The objection to this method of procedure would not be the one raised by our contemporary, viz., that it would strip the gears, though there might be some danger of that, but it would doubtless burn out the armature, and even if it did not do this it would fail to bring the car to rest as rapidly as might be done by a proper application of the brake. In series electric traction the danger to the armature above referred to does not exist, and electric braking can be resorted to with impunity, but to be effective it must not be applied so strongly as to produce skidding.

The chief difficulty with electric cars is their greater weight. No other mechanically propelled vehicle has *as good* braking facilities as has the electric car if they are properly manipulated, but the motorman on the usual trolley car has too many things to attend to. He has both hands continually occupied, and in the case of an emergency, unless he be of better stuff than the ordinary run of men, he will take the necessary steps to check his car in the wrong sequence, or omit one of the steps altogether, both of which are equally bad.

Electric cars, too, run at higher speed than other street vehicles, and although by the present means of braking a car can be brought to rest from a speed of ten miles an hour within a distance of ten feet if the braking mechanism be guided by proper intelligence, it is exceedingly doubtful if the number of accidents would be much lessened by any improved mechanism which would render stoppage possible within half the distance unless there were a higher intelligence behind it than that usually found on our street cars. Many of the accidents—we think it safe to say, most of them—that are attributed to faulty brakes are not due to that cause at all. In populous residential cities such as Brooklyn, where the streets are largely used as playgrounds by the children, no brake could be devised that would avert many of the accidents that are reported. A slower speed of the cars would alone prevent them, or a more perfect fender is required. The public are demanding rapid transit and with this demand it has come to stay. It seems a sad commentary on humanity to say that to the public as a body a few lives more or less are considered of no importance provided only that the convenience of the public is not interfered with. Hence rapid transit has come to stay simply because the public demands it. We would all hail with satisfaction any improvement in braking devices that will lessen the slaughter which results from this public demand, even though the improvement were ever so slight, but there is much greater room for improvement in fenders than there is in brakes, and still more room for improvement in the personnel of those who handle the cars than in either of the other two factors. We do not blame the motormen—they are as a rule an intelligent and painstaking class of men who aim to do as nearly right as they can. The fault lies in a system which will permit even bright and conscientious men to handle apparatus which they do not thoroughly understand. Some of the more progressive street railway companies endeavor to train their men to a thorough understanding of their apparatus before they put them in responsible positions. We know of some who have bought books which they have placed in the hands of their employees so that they might learn more intelligently the management of their motors, and who supplement this with instruction in the repair shop. This is all very well and commendable, but we know of no case where the men are regularly put through an emergency brake-drill which would enable them to manage their cars to better advantage when instantaneous and cool-headed action is demanded.

Our paid fire departments go through a regular drill every day in the year for the purpose of increasing their efficiency at fires. Why should not our motormen go through similar drills, if by that means life could be saved? We believe that we are coming to this, for it will pay. The motorman's position is often more trying than that of the steam locomotive engineer. Give him therefore a training that shall fit him to occupy it with credit to himself, with increased efficiency of the apparatus in hand, and greater safety to the public.

* * *

The Need of Telephone Organization.

The institution of the suit of the American Bell Telephone Company against the National Telephone Manufacturing Company, for alleged infringement of the Berliner patent of 1891, emphasizes in the most positive manner the urgent necessity for unity of purpose and action among the independent telephone manufacturers. The somewhat protracted delay in instituting suit on this patent has given rise to a feeling of security, more fancied than real, and the delusive hope that the Bell Company would do nothing has already been too long indulged. It is now evident that the Bell Company proposes to attempt to maintain its asserted rights under this alleged valid patent. Should it be able to do so, the consequences cannot be otherwise than disastrous to the independent telephone business. In fact, it will mean the almost complete demoralization of it.

With the possibilities of such a condition confronting them, it would seem to be almost gratuitous to presume that the independent telephone manufacturers need be urged to unite against a common enemy and one that threatens their very existence. The Bell Company is magnificently equipped in point of talent and capital to contest, in the courts and elsewhere, all its vested or predicated rights. There is not a single independent telephone company in existence that is able, of itself, to successfully combat this gigantic New England corporation, but by the organization of the scores of companies now in the field it is possible to create a combination of capital, talent and information that will be abundantly able to contest the validity of the Berliner patent in any and every court.

The future development of the independent telephone business may be said to hinge upon the outcome of the Bell Company's suit to determine the validity of the Berliner patent. If a decision favorable to the Bell Company is had in the New England judicial district, an injunction will immediately be obtained against every other manufacturer in that district. With the prestige of one decision in its favor, the Bell Company can go into other judicial districts, and, in all probability, secure favorable decisions there. And thus throughout the United States, until every independent telephone manufacturer is enjoined, just as was done in the incandescent lamp patent cases.

To avert the evil consequences of such adverse decisions, there seems to be but one thing to be done. The validity of the Berliner patent must be successfully attacked. A single one of the comparatively weak independent telephone companies cannot do this. All working in harmony can.

There are two organizations of independent telephone manufacturers now in the field, but the membership of both does not yet comprise all those engaged in the business. That the Bell Company, in the inauguration of its legal proceedings, should select a company that has declined to become identified with either organization, is significant, and should convey to all outside a hint of what is wisest and safest to be done. Had all the companies been completely unified by organization, it is not at all improbable that action on the part of the Bell Company would have been even longer delayed.

The formation of the Telephone Protective Association was suggested by the decision of the United States Circuit Court of Appeals in Boston in the suit brought by the Government for the cancellation of the Berliner patent of 1891 on the constant contact telephone transmitter. The instigators of the movement concluded that as the Bell Company not only has great resources in money at its command, but has the influence of its numerous licensees, whose stock in many cases is held by dangerously-near relatives of a great many Federal judges, the Berliner patent, while not a valid patent by any means, was one that might prove dangerous if not properly looked after. So they got together on a certain day in Chicago and formed the nucleus of the Association, and then, after the opinion of the Court was handed down, met at Pittsburg and completed the organization, which now has on its rolls most of the leading manufacturers of telephones and appliances therefor.

The object of the Association is solely defensive. It does not propose in any way to regulate the price of telephones or telephone service, but it simply stands ready to take up the gauntlet when it is thrown down by the Bell people. It proposes to meet the Bell people whenever they may offer battle, to employ the best legal talent to be had, and offset influence by proving facts.

Its attorneys and counsel will not be employed on account of their political "pull." They will be employed to win and will be aided by the members of the Association, all of whom are practical telephone men, men who know the art of telephony from its inception and who cannot be bought.

The Association is necessarily strong financially of course, but in information vastly stronger. It is ready at any time to defend, and has all the material necessary for answering a bill in equity already in the hands of its attorney. It wants a chance to defend, but wants the Government to keep its hands off. The Government has not the machinery for fighting a patent suit. In the Berliner suit it made a miserable failure. It did everything it ought not to have done, and left undone all that it ought to have done.

The Bell side of the case was splendidly managed. The Government side was mismanaged in every way. Now it remains for the Telephone Protective Association to see that the country shall not be further burdened by a monopoly which it had every reason to believe had expired.

The Association will not encourage piracy of any kind. Most of the members own patents, and those who do own them expect them to be respected as well by the members of the Association as by the general public, as they in turn propose to respect valid patents. They can expect no aid whatever from the Association in their private enterprises. They may rival each other and underbid as much as they please; they may give away their instruments if they choose. The Association has nothing to do with these matters. It has only one enemy to fight, and that is the American Bell Company, and its shield is against only one weapon, the Berliner 1891 patent, as it believes that this patent was fraudulently granted and is invalid.

The Eastern Protective Telephone Association is not yet fully organized, but its objects are essentially the same as those of the Western Association. It proposes to present a united front whenever the Bell Company invites issue on the Berliner patent, and is prepared to guarantee immunity to all its customers. Just why there should be two Associations is not apparent. It certainly would add much to the strength of the cause if the minor differences which now separate the Associations could be reconciled and the organizations resolved into one. But if each should insist in preserving the autonomy of its organization, there is no valid reason why they should not pool issues on the Berliner patent.

Under the Searchlight.

Views and Opinions on Timely Topics.

ANY person desiring to acquire the plant and business of a thriving electric light company in an Indiana city, with a profitable city contract for a term of years, and capable of earning, under present conditions, from $10,000 to $12,000 net per annum, can obtain further information from ELECTRICITY.

* * *

Wisdom of the "Electrical World."

(From Electricity, London.)

Some papers, and occasionally even electrical papers we are sorry to say, are a little slow in getting news even in go-ahead America. Our worthy contemporary, the *Electrical World*, for instance, seems to be singularly ill-provided with information about this country, or even with common books of reference. How else could the following paragraph have been evolved and passed?—

> "THE SNAEFELL MOUNTAIN RAILWAY.
>
> "Work on the electric railway to the summit of Snaefell Mountain, Wales, is progressing rapidly, and the road is expected to be ready for July. The overhead system will be used, and when this line is completed there will be a complete stretch from Douglas to Laxey, and thence to Snaefell, about ten miles in all."

That Wales is only ten miles distant from the Isle of Man will be news to most of us, and a cultured minority, who have read Mr. Hall Caine's novels, will be startled to hear that Snaefell is in Wales. The editor of the *Electrical World* should remember what happened to the man who read Oliver Wendell Holmes's joke, and forbear to trifle too much with our powers of endurance.

Brother Johnston is pretty familiar with the geography of Ireland, and we suggest that the next time he goes abroad he take pains to learn something about the rest of the kingdom of Her Gracious Majesty.

* * *

"BIRDS OF A FEATHER."

Two of Mr. Coffin's Friends.

A few days ago receivers were appointed for the Trenton Rubber Company and the Central Jersey Traction Company, in both of which companies Mr. Frank A. Magowan was a leading spirit. His affairs are said to be badly tangled, and considerable of his paper is reported to have already gone to protest.

Mr. Magowan is the gentleman with whose assistance Mr. C. A. Coffin sandbagged the electric light company into a consolidation with a paper company which Coffin, Magowan and Mr. X. Y. Z. Maguire had arranged for the purpose.

A recent dispatch from Tacoma says:

> The estate of the late defaulting general land agent of the Northern Pacific Railroad, Paul Schulze, who was accused of involving the Armours, of Chicago, to their loss, in Tacoma street railways, has been sued by Paul F. Mohr, a New York capitalist, for wines which he alleges Schulze purloined and drank while Mohr was absent from the Union Club of this city. Mohr laid in a choice stock of old wines while Schulze was cutting wide swaths a few years ago, and going away to Eastern cities he gave Schulze the key to his wine cellar here. Schulze was to take only a sample now and then, but he visited the cellar and made off with everything.

Mr. Schulze was the man with whose assistance Mr. Coffin and Mr. Byllesby carried through the Tacoma street railroad swindle.

ELECTRICAL FAKIRS AND THE DAILY PRESS.

A Sample Case.

The following appeared in a recent issue of the Boston *Transcript:*

> To write the history of electricity without using the name of Van Choate would be like playing "Hamlet" and leaving out the melancholy Dane. . . But none except educated electricians know how crude and impracticable are the electrical appliances now in use. and what a vast amount of energy is wasted in the transmission of this mysterious force. Mr. Van. Choate's inventions show a saving of over 60 per cent. in the transmission of energy from one point to another. This one fact alone makes his system worthy of careful investigation by conservative investors. If this and the other claims of the company can be sustained, and we have every reason to believe that they can, it is only a question of time when the other electric companies will have to get off the face of the earth.

Of course this was a paid notice, and of course it was designed to assist Mr. Pennock's chief rival in swindling the public.

One of our constituents, who evidently considered, as we did at one time, that the *Transcript* was honestly conducted, and had been imposed upon, called the attention of the editor to the matter in the following letter:

> Editor Boston "Transcript":
>
> Dear Sir: I notice on page 10 of your issue of to-day a brief article, "The Advance in Electricity." As I know nothing about the remarkably prolific character of the gentleman's inventions, I pass at once to the middle of the article to criticize the statement, "None except educated electricians, etc." This and the following sentence are misleading in the extreme. The first is absolutely wrong, modern electrical apparatus standing well at the head of modern engineering practice in point of efficiency. Certainly, machines which work with a commercial efficiency of 94 per cent. to 97 per cent. can hardly be called inefficient, while no man who ever entered a modern power-house with a fair average amount of brains in his possession would come out of it with the word "impracticable" on his lips. As to the second sentence of the two, I will criticize it by a paraphrase on the following two lines, thus: This one fact alone makes his system unworthy of careful investigation by intelligent investors. I am far from desiring in any way to underrate Mr. Van Choate's work, but if he is a wise man he will regret as much as any one else the making of such dubious claims as this, which tend to make an electrician feel *a priori* toward it as one does toward "the Pennock system" and the many disreputable electro-medical frauds, which frequently make one blush for the paper in whose columns their advertisements appear.
>
> It is the appearance of erroneous paragraphs such as this, which lead the non-technical public astray and maintain the popular illusion concerning the amazing possibilities of electricity, that all electricians desire to see give place to an intelligent appreciation of this newest branch of science and engineering. I am sir, very sincerely yours, ELECTRICIAN.
>
> Boston, June 27, 1895.

To this the following reply was received:

> Dear Sir: I am much obliged to you for your criticism of the paragraph on the Van Choate electric system, but as that was not the kind of paragraph in which we expect to state things with scientific accuracy, it belonging to the class of items aiming only to secure publicity, I do not think it is well to add a gratuitous amount of that commodity. I should prefer to make the statement that you give us concerning the efficiency of electrical machines in some form independent entirely of that item. Very truly yours, EDITOR "TRANSCRIPT."
>
> Boston June 29, 1895.

The sense of moral responsibility in the office of the Boston *Transcript* is not what it was twenty years ago, and it is little wonder that the influence of the paper is only a reminiscence

We give space to this matter to convince the public that daily paper statements in regard to electrical subjects or electrical companies are totally unreliable.

Those who hold that only fools invest in the Pennock and Van Choate schemes are mistaken. A large number of otherwise intelligent people have been led to invest by just such notices as this in the *Transcript*, appearing with editorial sanction, not marked as an advertisement, but paid for at so much per line.

Convention of Edison Illuminating Companies.

THE PROGRAMME.

Lively Discussions Expected.

(Special Dispatch to ELECTRICITY.)

DETROIT, Mich., Aug. 13.

The Sixteenth Convention of the Association of Edison Illuminating Companies begins here to-day.

The first thing on the programme is "Addresses on the Relation of the General Electric Company to Edison Licensee Companies."

A meeting of the Executive Committee, composed of Messrs. Beggs, Marks, Gilbert and Weeks, was held yesterday, at which Mr. Coffin and S. D. Greene were present. Mr. Coffin left for the East last night, leaving Mr. Greene in charge of the defence. There will be a lively discussion of the complex situation which has puzzled licensees and parent company alike.

Among other General Electric representatives are Sunny, Lovejoy, Emmet and Paige.

A sign of the times is noted in the preparations for a full discussion of the two-phase system, which even Edison licensees are being forced to adopt.

The sessions close on Wednesday.

Illuminated Trolley Excursions.

Six open cars, elaborately trimmed with bunting and brilliantly decorated with red, white and blue incandescent lamps, were used to inaugurate the illuminated trolley car excursion on the Brooklyn Heights railroad in Brooklyn on Wednesday night. The cars ran over the various lines of the city and met at City Hall at 8 o'clock, proceeding thence, in processional order, to Ulmer Park, at Bensonhurst. Over three hundred passengers were guests of the company, among whom were ex-Governor Flower, ex-Lieutenant Governor Sheehan, representatives of the press and others.

The Electric Elevator.

Messrs. J. Hammond & Co., who for ten years were the representatives of the Otis Company on the Pacific Coast, and who have probably installed more elevators than all other concerns combined in that section, are among the latest converts to the superiorities of the electric elevator, and have become the agents of the Sprague-Pratt Company on the Pacific Coast.

Eugene Phillips's Clambake.

The 17th annual clambake of the American Electrical Works will be given at Haute River on Saturday August 17 next. This occasion also marks the 25th anniversary of the founding of the business.

Personal.

Mr. Max Berg, late with the Wallace Electric Company, has taken the Chicago agency of the Mansfield Brass Company.

Dr. Arthur Browne, of Boston, who was for a long time with the Edison General Electric Company, is again doing special work for the General Electric Company in the South.

Mr. H. L. Luffkin of the Crocker-Wheeler Electric Company, has recently returned from a six weeks' trip through the West.

GENERAL ELECTRIC'S FINANCING POLICY.

Northwest General Electric—The Scheme, the Companies Financed, the Facts and Figures from the Official Record.

HOW BONDS ARE MANUFACTURED FOR NEW ENGLAND INVESTORS.

CHAPTER V.

The Tacoma Railway and Motor Company.—II.

INTRODUCTORY.

Although ELECTRICITY is in almost daily receipt of letters commending us for the present series of articles, paying us high compliments for the style of treatment of the subject and for the clear proof presented by the publication of original documents and official records which cannot be disputed, yet we suppose there are some members of the fraternity who doubt the propriety or fairness of calling attention to the bad spots in the electric railway business. If there are any such among our constituents, we desire to address a few remarks to them for their edification and instruction.

The railway companies so far treated by us can scarcely be considered as rotten spots in an otherwise sound and healthy business. They are rather only a part of the mass of rottenness which is the result of the Coffinesque method of financiering—a method which has found many imitators—the results of which are just the same by whomsoever applied. The object of the series is two-fold. First, to show conclusively that the plan of financing which has been in vogue since 1888 is radically wrong, that every system to which it has been applied must end in bankruptcy and reorganization or be wiped out altogether; and second, that the one man responsible for the entire plan is Charles Albert Coffin. Every other man connected with the scheme of bonding street railway plants for from two to ten times their value, selling the bonds to Eastern investors, has been either a tool or an imitator of Mr. Coffin.

ELECTRICITY will never agree to the theory that the publication of actual facts in regard to the electric railway business is a crime, or even ill-advised. The situation is the result of crime; it is almost wholly bad, and radical improvement in it can only be brought about by a dissemination of facts, by pointing out the causes, and showing just why scarcely a month passes without one or more of the systems confessing bankruptcy.

The one prime cause to which all others are subsidiary is over-capitalization.

We all know the unsavory record which the steam railway business has made for itself. The financial management of American steam railways has become a stench in the nostrils of the investing public in every civilized part of the world. With few exceptions, there has apparently been no other object on the part of the promoters than the sale of securities, which have been piled up until a startling percentage of the entire railway mileage of America is in the hands of the courts for the benefit of deluded security-holders.

According to the reports of the Inter-State Commerce Commission, there were in June, 1893, 1,890 steam railroads in the United States, of which 156 were then in the hands of receivers. There were in the latter number several of the larger systems, so that the mileage of receivership systems, 38,869.96, was nearly one-third of the total mileage of the country. To-day the proportion is much larger. The total capital (investments confessed to be in jeopardy) of the receivership properties was $2,500,000,000.

The Commissioners say in their report:

"An investigation into the history of the 156 roads in the hands of receivers shows them to have been burdened with an indebtedness which was with difficulty carried through even prosperous times."

We do not think any argument is needed, however, to prove the over-capitalization of American steam roads. But how many of our readers have ever taken pains to make any comparisons between the steam and electric railway industries?

According to the *Street Railway Journal's* statistics, which are the best obtainable and approximately correct, the street railways of the country make the following showing:

CAPITALIZATION OF STREET RAILWAYS.

Total number roads		196
Mileage:		
Horse	1,914	
Electric	10,363	
Cable	682	
Miscellaneous	679	
		13,588
Capital stock	$748,014,206	
Funded debt	552,125,505	
Total capitalization		$1,300,139,711
Average capitalization per mile of track		$95,600

As against this the showing of the steam roads is altogether in favor of the latter. The report referred to (1893) gives the following figures:

CAPITALIZATION OF STEAM RAILWAYS.

Common stock	$3,962,009,602
Preferred stock	686,285,816
Total stock	$4,648,295,418
Funded debt	5,225,689,821
Total capitalization	$9,873,985,239
Average capitalization per mile of track	$59,729

The electric railway business is only seven years old. The steam railway business has enough age to have been thoroughly tested, and the results of over-capitalization (a conservative term for robbery) are painfully in evidence. Yet the capitalization is but little over half as much per mile as that of the street railways.

Every man who knows anything at all about the two kinds of roads knows that the *actual cost* per mile of electric roads is not over half the actual cost of steam roads. How, then, can success be hoped for in our electric systems unless a revolution in methods is created? If any one shall argue that this plan of over-capitalization, while resorted to in the beginning, is now obsolete, we have but to point to the present plan of reorganization in Philadelphia, with the millions added to an already unsafe capitalization.

THE TACOMA OPERATION.

A few weeks ago when the Messrs. Armour, of Chicago, brought suit against the financiers who engineered the Tacoma street railway bonding scheme, ELECTRICITY (June 12) presented a review of the condition of the Tacoma Railway and Motor Company and of the companies which it succeeded. There was considerable interest in that specific case of Thomson-Houston financiering at the time, and it seemed best to anticipate our general plan a little by giving the public the information which was not easily to be had except through these columns. Although that

TACOMA RAILWAY AND MOTOR COMPANY.

STATEMENT OF EXPENDITURES, OCTOBER, 1892.

OPERATING EXPENSES.	For Oct., 1891.	For Oct., 1892.	From July 1, 1892, to Sept. 30, 1892.	Total 4 months, 1892.
General expenses:				
Salaries—General officers and clerks	$679.65	$457.66	$1,456.98	$1,914.64
Miscellaneous expense	131.12	36.84	144.83	181.67
Stationery, printing and advertising	130.40	155.20	888.15	1,043.35
Legal expense	......	......	......	......
Insurance	180.00	329.12	815.45	1,144.57
Injuries to persons and property	14.00	1.85	84.40	86.25
Rents	127.50	......	275.00	275.00
Taxes	184.10	392.98	1,113.24	1,506.22
Secret service	......	11.20	45.75	56.95
Total	$1,446.77	$1,384.85	$4,823.80	$6,208.65
Transportation expense:				
Car service	$5,470.40	$6,270.65	$18,439.78	$24,710.38
Car house expense	215.80	315.05	729.50	1,044.55
Total	$5,686.20	$6,585.70	$19,169.28	$25,754.98
Motive power expense:				
Power service	$675.85	$705.30	$2,649.54	$3,354.84
Power expense	1.88	180.57	406.58	587.15
Oil and waste	168.81	56.78	208.97	265.75
Fuel	1,180.53	1,131.35	3,443.75	4,575.10
Total	$2,027.07	$2,074.00	$6,708.84	$8,782.84
Total expense	$9,160.04	$9,994.55	$30,751.87	$40,746.42
Maintenance of rolling stock:				
Repair service	$1,813.35	$760.30	$2,696.76	$3,457.06
Repairs and renewals of cars	698.95	193.35	582.07	775.42
Armatures and fields	541.30	68.21	757.96	826.17
Gears and pinions	160.50	79.18	5,654.45	644.63
Other repairs	.60	......	10.65	10.65
Grips	......	35.41	60.83	96.24
Machine shop, tools and machinery	......	......	31.73	31.73
Total	$3,214.70	$1,136.45	$4,705.45	$5,841.90
Maintenance of power plant:				
Repairs and renewals, engines and boilers	$53.28	$99.18	$351.61	$450.74
" " " dynamos	16.07	77.73	29.27	107.00
" " " cable and cable machinery	......	426.88	1,183.83	1,610.71
Total	$69.35	$603.74	$1,564.71	$2,168.45

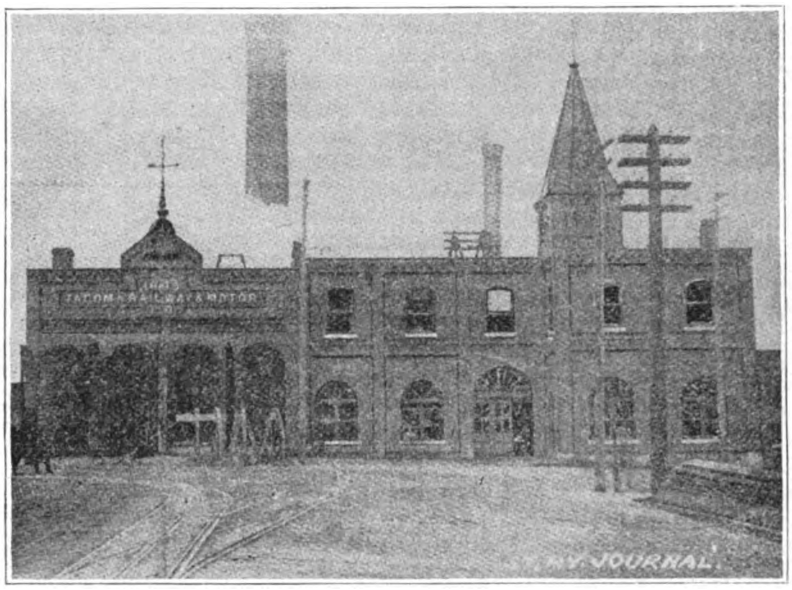
Maintenance of overhead system and ground connections	$79.80	$131.91	$372.64	$504.55
Horse feed, etc	......	......	29.75	29.75
Total	$79.80	$131.91	$402.39	$534.30
Total maintenance	$4,030.36	$2,439.64	$8,102.01	$10,541.65
Total operating expenses	$13,190.40	$12,434.19	$38,853.88	$51,288.07

article was quite long, it did not do full justice to the case. We will now, therefore, consider some features which were necessarily neglected before.

We have already shown in the article referred to, by the official statement of the company, prepared June 1, 1892, that the entire property was in a hopelessly bankrupt condition when it was planned to increase the capitalization to $2,500,000. The company was unable to pay even the interest on its floating debt, to say nothing of meeting the interest on its bonds already issued. These facts had, however, little influence upon Mr. Coffin. His company had a contract with the United Electric Securities Company by which the latter took bonds at the uniform price of 80; and whenever they could be taken at 60 there was nothing in the Coffinesque plan to prevent their manufacture, no matter how infinitesmal the chances of interest ever being paid on them.



POWER HOUSE TACOMA RAILWAY AND MOTOR COMPANY.

14 UNITED ELECTRIC SECURITIES CO.

$1,000,000 COLLATERAL TRUST BONDS.
SEVENTH SERIES.
Issued September 8, 1892.
Statement of Sales of Underlying Bonds.

BOSTON, MASS., August 1, 1894.

Underlying Bonds.		Sold to Date.
Atlanta Con. St. R'y Co.	$11,000	$11,000
Cumberland E. L. & P. Co.	125,000	------------
Hartman Gen. El. Co.	145,000	------------
Hudson Elec. L't Co.	200,000	------------
Indianapolis L. & P. Co.	21,000	21,000
Kingston Electric Co.	150,000	------------
Louisiana El. L't Co.	150,000	5,000

Collateral Trust Fives redeemed and cancelled } $12,000 at a cost of 9,240

Balance $1,860

We present this week an additional statement, copied from the official records, showing the necessary expenditures for operation of the system for October, 1891, October, 1892, and for the four months ending October 31, 1892. This is worth noticing, chiefly because it shows beyond the possibility of denial that Mr. Coffin and Mr. Byllesby both had full information at hand concerning the actual condition of all these properties. They were not ignorant. They knew just how hopeless the case was in every instance before these increases of capitalization were made and the worthless paper foisted upon the investing community.

In our articles on the other plants so far treated in this series we have presented the official inventories, showing that, even when large amounts of money were raised from the sale of bonds, the local plants got little benefit in the way of equipment. The rule was to spend as little as possible for property, or rather for the parent Thomson-Houston (G. E.) Company in the East, to give as little as possible for the money received. In nearly every case, as we have proven, the total property account, even when padded with surprising audacity, was much less than the amount of bonds issued.

At Tacoma we find precisely the same conditions. In 1893, after Mr. Coffin had carried out his gigantic scheme for a capitalization of $2,500,000, the street-railway system was wofully deficient in equipment. The deal had been worked to its full limit. Every dollar possible had been realized from the sale of securities, and every dollar was misappropriated.

The Tacoma and Steilacoom branch had then, 1893, thirteen miles of track, forty-five lb. T rails, and *seven* cars.

The Tacoma system proper had one 150 H. P. engine, two of 750 H. P. each, and one of 300 H. P. There were six 150 K. W. Edison generators, twenty-six motor cars, equipped with W. P. 50s and W. P. 30s. The largest engine was a relic of the past, one of the original Corliss type, and had been in use in a sawmill for thirty years. It may have been valuable—as a museum curiosity.

It is easily seen that, even if the receipts had been much larger, every precaution had been taken against giving the bondholders any valid security for their investment in the way of good and efficient equipment.

We give our readers a view of the exterior of the power house of this $2,250,000 system. It needs no comment.

Now let us consider this Tacoma enterprise as a possible earner of money. Taking the same method of treatment as applied to the other properties, the justice of which is thoroughly established by the authorities, we find, taking the *official* statements of the Tacoma Railway and Motor Company as our basis:

The yearly fixed charges were:

Interest on bonds	$7 ,00 .00
Interest on floating debt @ 6 per cent.	44,183.00
Allowance for depreciation should have been 6 per cent. on $2,250,000	135,000.00
Dividends on $1,000,000 stock at 6 per cent.	60,000.00
Total	$814,183.00
which is 25 per cent. of what the road to be a sound property needed to earn per annum, or	$1,256,782.00
Actual earnings were (yearly rate)	$244,865.04

or less than one-fifth of what they must have been to justify the capitalization of $2,250 000 issued.

Deduct from $814,183, as above, the $60,000 item for stock dividends, which it may be argued did not need to be paid, and we have	$254,183.00

which is 25 per cent. of what the road needed

to earn in order to exist at all, or........... $1,016,782.00
about four times the gross receipts of the road
after it had been electrically equipped,
managed by supposed experts and capitalized for $2,250,000, with $250,000 of bonds
yet to be issued for "betterments."

To comprehend the full details of the marvelous scheme of financing which won for "young Coffin" (as Edwards of the Philadelphia *Press* referred to him) the title of Napoleon III. of Finance, it is necessary to keep in mind all the channels through which these worthless securities passed on their way to the private lockers of the small investors of the East. The all-important link in the chain was the United Electric Securities Company of Boston, which turned them over to the public through its own collateral trust series, holding the local company bonds as collateral only until they could be disposed of, when the collateral trusts were retired. This Securities Company still holds $600,000 of these Tacoma bonds, as shown by the accompanying fac-simile copies of pages 14, 15 and 16 of the official report of the company. In addition, the General Electric Company and the Street Railway and Illuminating Properties have $250,000 each, all awaiting the attention of the careful investor of the funds of widows and orphans in the East, or of other kinds of financial institutions.

So much for the Tacoma Railway and Motor Company, its bonds and their worth.

Considering the capitalization per capita of the population of Tacoma, the difference between the amount of securities issued and the amount which should have been issued is very large. The capitalization was $2,500,000. There were in Tacoma 36,000 inhabitants. The system would have had a fair chance of success if capitalized at $15 per capita, or $540,000.

A careful study of all the plants in the Northwest put in by the Northwest Thomson-Houston (G. E.) Company shows that not one has the possibility of ultimate success, and those which have not so far confessed bankruptcy must do so very soon.

RECEIVER FOR THE ST. CLOUD PROPERTY.

The St. Paul Title Insurance and Trust Company applied last week for a receiver for the St. Cloud City Street Car Company, which has defaulted on the interest on its $125,000 of bonds.

This is one of the companies whose affairs we have recently gone into at some length.

We are willing to go on record with the prophecy that *every local company* which the Northwest Thomson-Houston (G. E.) Company had to do with, will be compelled to go through a receivership and a reorganization, or go out of business altogether.

Prize Offered.

The Royal Scottish Society of Arts has decided to offer for competition a Keith prize of £50 for improvements in electric energy meters for domestic supply. Competitors will be expected to submit, in addition to a descriptive paper accompanied by detail drawings, a working meter adjusted for a mean pressure of 115 volts, and suitable for a house in which the minimum number of watts being taken at any time is 4,000. Special importance will be attached to the minimum load at which the meter can register correctly, and to the energy absorbed by the meter when the consumer is using a light load, or when no energy is being taken. Conditions of the competition were discussed and adjusted, and it was agreed that the award should be made during the session of 1896, the Society reserving the right to withhold the prize in the event of there being nothing deserving the award. Alternatively, the Society may award a smaller amount should anything meritorious, but not deserving the full prize, be sent in.

ELECTRIC TRACTION FOR TRAMWAYS IN TOWNS.

(From our Special London Correspondent.)

Before the Tramways Institute of Great Britain and Ireland the other day, Mr. Geo. Cawley read a paper on "A Method of Electric Traction for Tramways in Towns," with special reference to the Thwaite-Cawley system The author set forth a variety of figures and statements as to American experience, and considered the great success of electric traction in the States ample justification for Great Britain adopting it in earnest. His paper was divided into two questions:

(1) Which is the best electrical haulage method for any given line?

(2) How soon, having regard to financial and other preliminary difficulties, can our present horse haulage be supplanted by an electrical haulage arrangement?

A careful analysis of a large number of electric tramway accounts relating to Continental and American practice has been recently made, with the result that the average working cost per car mile, leaving out only the item of interest upon capital, comes out at 6½d. in America and 5½d. in Europe. The ratio of working expenses to receipts, taking both Europe and America together, is approximately 60 per cent. Mr. Cawley stated that if we wish to place ourselves on a level with electric tramway enterprise in America, we have plenty of ground to make up. The accumulator system could be fairly and simply applied without disturbance of a line, but, for reasons of working cost alone, it was not likely to be permanently adopted in English practice unless accumulators could be materially improved and lessened in weight. We have then the conduit or culvert system, and this is a relatively costly system to construct, but on account of the scope it gives for embodying practical solidity and durability in the working details, and to the convenient disposition of the conductors below ground, he ventured to think this system would be chiefly adopted for tramways. Although the conduit system has been adopted in several places in the United States and on the Continent, there is only one example of this system in England, i. e., at Blackpool.

The overhead trolley system as adopted in America, Mr. Cawley thought, would not be permitted on similar lines over here. Having regard to the general requirements of British tramway traffic, and to the opposition which many local authorities would give to the overhead system in towns, we may not unreasonably conclude that some form or other of the conduit system is the one most likely to be adopted for electrical traction on British urban tramways. The cost of construction would of course vary with local circumstances. The working expenses would be found relatively very low.

Mr. Cawley concluded his paper with a brief recital of some of the advantages claimed for his system:

1. The culvert is of sufficient dimensions to allow examination or repairs of the conductors or culvert track to be efficiently carried out.

2. The culvert can be kept quite free from water, mud, or dust, by a brush attached to the culvert locomotive.

3. The locomotive rails being laid inside the culvert, the tractive efficiency of the driving wheels is not affected by snow or frost.

4. When the culvert is once laid the street traffic need not be afterwards disturbed, except at long period intervals for the replacement of the tram-line rails.

5. Ordinary horse-haulage tramcars can be used without any structural alterations.

6. The electro-motors used are gearless, and yet run at a relatively high speed and efficiency.

7. All sparking above the street level is completely prevented.

8. All danger to the pedestrian public in the way of accidental electric shocks is entirely obviated.

9. Posts or other erections along the tramway route are unnecessary, and the appearance of the tramway thoroughfare is not affected.

10. The tramway rails as used for horse haulage cars need not be replaced by rails of heavier section.

11. The system can be conveniently worked in connection with suburban lines using either horse or electric traction.

12. The load on driving wheels of the locomotive is proportional to the traction requirements of the car.

13. The outward and return circuits can be entirely insulated from the earth or buried pipes, thereby preventing any destructive electrolytic action on outside property.

14. The system, in general design, is of a character to reduce the cost of repairs to a minimum, and to ensure the durability of the plant over a long period of years.

The Electrophone.

We are informed by the Electrophone Limited, of Shaftesbury Avenue, W., that the "eloquence of Dean Farrar on the occasion of his farewell address will not only reach his devoted congregation at St. Margaret's, Westminster, but his utterances, which cannot but be most impressive, will at the same instant be transmitted through the electrophone to his host of admirers in other districts of London, and probably to hospitals, thus enabling the invalided and those unable to be present for want of room and other reasons to avoid missing an intellectual discourse. St. Margaret's, Westminster; St. Anne's, Soho; St. Martin's-in-the-Fields; St. Michael's, Chester Square; the Highbury Congregational, Marylebone Presbyterian, and Christ Church, Birmingham, etc., are the churches amongst the leaders in this interesting and benevolent movement." The communication is dated the 15th ult., but the date of the function has not been vouchsafed by the company.

The Spectrum of Carbon from the Electric Furnace.

In a recent communication to the Académie des Sciences, M. Deslandres stated that M. Moissan recently pointed out that the carbons which he uses for his electric furnace are purified by the passage through them of the large currents employed. As it is very difficult to purify carbon by the chemical way, M. Deslandres emphasizes the importance and interest of this property of the electric furnace, especially to spectroscopists who often use pure carbon in qualitative analysis. It was on this account that M. Deslandres paid special attention to the statement of M. Moissan, and carried out an investigation to verify its correctness. M. Moissan placed at M. Deslandres' disposal two carbon electrodes, a positive and a negative, 20 cm. long and 5 cm. thick, which he had made use of in some electric furnace experiments. M. Deslandres took from each electrode small pieces of carbon at distances of 15, 10, 5 and 1 cm. from the arc. He found that the pieces which were taken from the electrode at some distance from the arc showed the ordinary impurities of carbon, namely, alkaline metals, together with copper, iron and silicium. When, however, he came to examine the pieces which had been taken close up to the arc, the bands denoting impurity finally disappeared, with the exception of the calcium bands, which, although very much reduced, always remain visible, a fact which M. Deslandres attributes to the lime wall of the furnace, which is probably partly volatilized when large currents are used. M. Deslandres attributes this purification of carbon to a purely physical cause, the impurities being much more volatile than carbon, and being therefore vaporized before it. The purest carbon was obtained from the mushrooms which form on the negative, and with one of these mushrooms M. Deslandres obtained a spectrum which contains fewer impurity bands than any of the spectra hitherto published.

LONG DISTANCE TRANSMISSION AT 10,000 VOLTS*—III.

(The Pomona Plant.)

BY GEORGE HERBERT WINSLOW.

Commercial lighting in Pomona was begun November 28th, 1892, and a telegraphic order was at once sent for another set of reducing transformers, to be used at San Bernardino, where the local circuits were already nearly completed. It was a condition of the franchise for the latter place that lighting should be begun before January 1st, and work was pushed rapidly on the transmission line, over 28 miles long, until it was finished. The order for transformers had, however, been given too late for them to be delivered in time, and it was decided to reduce the pressure at Pomona to 5,000 volts and to take to San Bernardino the half of the Pomona bank thus made available. In order to avoid the reheating which would have been required had the transformers been dismounted for shipment, the latter were hauled to San Bernardino on wagons without springs, after the lids had been packed so that the oil could not splash out. The transformers reached their destination after midnight, and the next day, December 31st, they were connected to the transmission line for a few moments to see that the latter was all right, after which all the lights on the circuit were thrown on for the night.

When the new transformers arrived they were set up and heated in the same way as the others. The heating was continued night and day until complete, without interrupting the regular lighting service. The change of both circuits to 10,000 volts was made February 16th, 1893.

The sub-stations at Pomona and San Bernardino are small brick buildings, one story high, with flat tin roofs and numerous windows. The Pomona building contains two rooms connected by a door near the switchboard. The front room is used as the office of the company, and the other as a transformer room. The 10,000 volt circuit enters over the door, and is connected directly to the bank of lowering transformers, no switches or other appliances being used on the high tension lines either there or at San Bernardino. The switchboard appliances are a Stillwell regulator, two 100-amp. marble fuse-blocks with double plugs and fuses, 100-amp. jawswitch, 150-amp. ammeter, compensating voltmeter, compensator and converter.

The San Bernardino sub-station is longer than that at Pomona, and is not divided by a wall. The transformers are placed in a row along a side wall and along part of the end wall next the switchboard. The transformers near the switchboard heat the most. This is probably due to the slight drop in wiring between them and the more distant converters. During the first year of operation a little new oil was put into the converters about every four months to make up for that evaporated, but none of the old oil was drawn off. The switchboard apparatus is like that at Pomona.

The Stillwell regulator has long been recognized as a valuable adjunct to the central station operating a number of feeders of different lengths from a single dynamo. Its utility is still greater in a system of long-distance transmission in which the transmission circuits are supplied from one dynamo, as was the case in this plant during its first year of operation, since it is not practicable to install such a system as to operate with small line-loss, and therefore means must be provided to compensate for the large differences in the pressure at the ends of the lines. The use of regulators at the power-house was impossible when but one bank of raising transformers was used for the two circuits. Even when it became possible by the use of separate banks of transformers, it was still undesirable because the attendant at the power-house would often have had to work both the regulators at once to properly compensate for changes in load, and his attention would have been required by the regulators at exactly the time he should have been free to attend to the generators. A regulator was therefore placed at each sub station, as already stated. These are each of 2,000 lights capacity and have a range of 10 per cent. up and 10 per cent. down. This variation of 10 per cent. (100 volts) is divided into 14 equal parts, so that each step corresponds to 7.1 volts. The diagram (Fig. 5) was taken one Sunday, while using only 5,000 volts, and shows the number of changes required during the evening at each station. The line marked "off" is the base line, and the divisions above and below correspond to the steps on the dial and show to what an extent the regulators were used to increase or decrease the pressure. This diagram shows how impossible it would be to furnish lights without using regulators, even on Sunday, when the load is much smaller than on other days. It also shows that on that day the pressure at Pomona was being mostly reduced while that at San Bernardino at times (as at the point marked "very bad light") could not be sufficiently increased. This indicates that the pressure of the lowering transformers at one of the sub-stations should be changed so as to make the pressure at both more nearly equal. In the present plant this is done by changing the number of transformers.

The distribution from both sub-stations is effected in the usual manner at 1,000 volts for incandescent lighting, the only point of interest being that a considerable number of Helios arc lamps are successfully used on the incandescent circuits.

While in use the transformers in the sub-stations give forth a continuous hum which depends for its tone on the number of alternations. This is an excellent indicator for the attendant, whose attention is instantly called to any change in the running conditions of the plant by the resulting change of tone. Its indications not only mark changes which are taking place and which can be detected on the voltmeter, but also give notice of coming changes before there is any other indication of them. It is thus possible to foretell a coming drop in voltage in time to use the regulator and thus keep the voltmeter needle perfectly still, though the voltmeter is a very sensitive instrument and the regulator is often moved four or five notches. The hum often changes, however, without any corresponding movement of the voltmeter, but the sound is then somewhat different. At rare intervals the switchboard lights will suddenly change slightly in candlepower before any change is noticeable on the voltmeter.

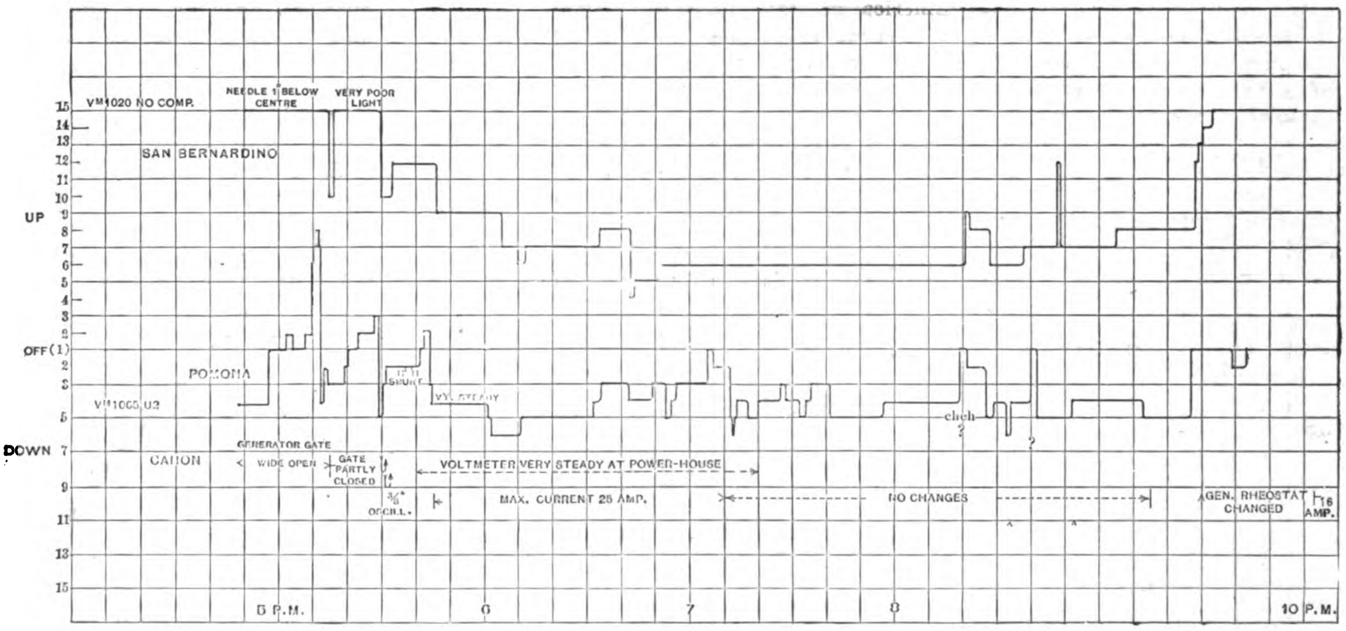

FIG. 5.—Record of Sunday, January 22, 1893, for Pomona, San Bernardino and Canon.

It is noticeable that the needle will often stand for a time perfectly still on the center, and, on a slight rise in the hum, will start gently, rising never more than three-quarters of an inch, and then as the tone gradually becomes lower, slowly fall back to the center, and stop without passing it. At other times the variation in hum is more sudden and the needle will rise and oscillate above the center. Again, the needle will oscillate equally about the center during a regular rise and fall of hum, its movement being apparently due to one impulse and not seeming to be modified by subsequent variations. There is no apparent change in candle-power of the lamps during the voltmeter changes noted. These notes were made while the plant was running at only 5,000 volts, but they were later confirmed when using 10,000 volts. During dry weather there is considerable intermittent oscillation of the voltmeter-needle without there being any change in load or any other apparent cause, while in wet weather the needle remains perfectly still for many minutes at a time, often for as much as half an hour. A possible explanation of this oscillation may be found in the presence of static charges on the line, due to atmospheric electricity. That the line is often heavily charged from the air is shown by a number of observations. One afternoon a painful shock was obtained on touching the line at the canon end, drifting clouds and a strong wind being noticed in the valley. Again, while using the telephone a report was heard in it so sharp as to cause momentary deafness. Later, after a moderate wind had been blowing for some time, loud reports were noticed on the telephone at long intervals. As the wind became higher the reports came oftener, and the intervals between the reports became shorter. It was evident that there was a discharge from the lines through the telephone (which was on a metallic circuit) and that it depended on the rate at which the wind blew. In order to get the strongest effect the two wires were connected in the usual way to the raising and lowering transformers, and one side of the telephone connected to one wire. On connecting the other side of the telephone to ground a sharp report was heard, and on maintaining the connection there was a sound as of steam escaping at a distance, with intermittent and very faint crackling. If the ground contact was made slowly there was a bright spark before the metals touched, and a loud report. If the fingers were interposed a smart shock was received. By making and breaking the ground connection rapidly, the line was prevented from accumulating a heavy charge, and no spark was visible, though a faint crack was heard. If a slight space was left between the telephone wire and the ground, a spark occurred at fairly regular intervals, and when the space was lessened the sparks became smaller and more frequent. When the wind lessened the sparks and reports became almost imperceptible, but on the wind becoming strong and blustery a large spark was again obtained. When one line wire was disconnected from the transformers at Pomona the effect obtained from grounding that wire was less owing to the reduction in capacity.

---

*A paper presented at the Twelfth General Meeting of the American Institute of Electrical Engineers, Niagara Falls, June 27, 1895.

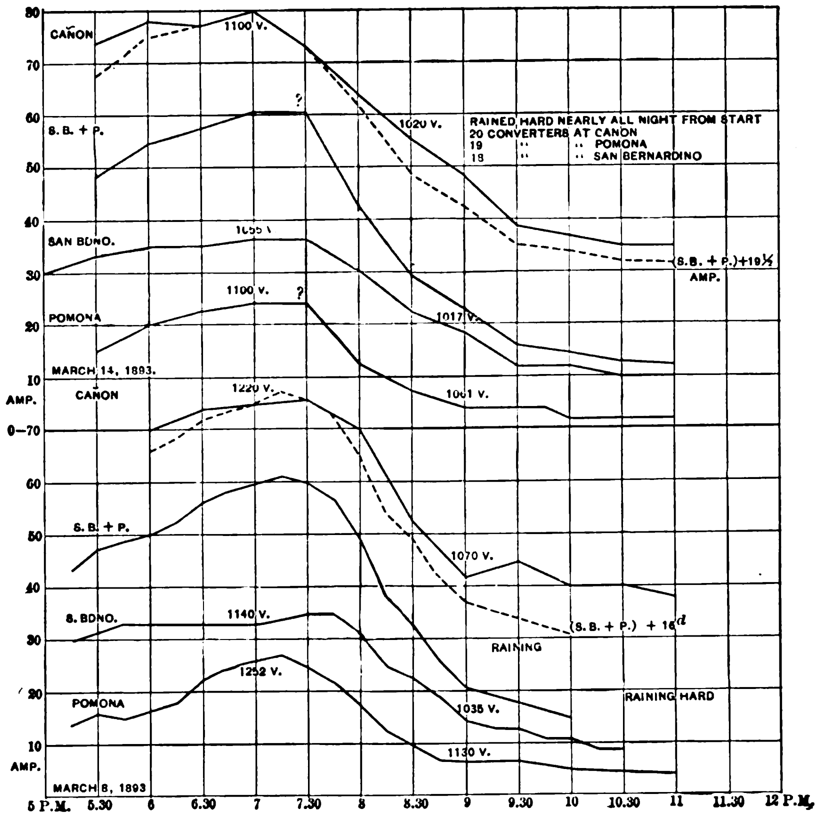

FIG. 6.—Ampere Curves. Showing Excess of Canon Load and also Decrease in Difference between Canon Load and the sum of Pomona and San Bernardino Loads as the Canon Load Increases. Note increase due to rain. Raining in afternoon and nearly all night at Pomona. Snowing throughout canon and a mile or so outside of mouth of canon. Eight inches of snow at power-house, covering insulators and cross-arms completely. One inch of snow on wires. Snow damp and clinging. No wind. Twenty conductors at canon, 19 at Pomona and San Bernardino. 12 P. M.

These observations, which were made on the Pomona circuit during hot, dry and cloudless weather, show conclusively that the lines were heavily charged by the action of the wind. The wind no doubt blows electrified air and dust against the wires, the latter thereby accumulating a static charge with a rapidity which we have seen depended on the speed of the wind.

Some curious conditions met with in the operation of the plant are shown in the ampere curves in Fig. 6, which were taken during very wet weather. Taking the maximum load measurements at 7 P. M. for March 14 and 8, we note that the total apparent energy delivered by the sub-stations is 73 per cent. and 75 per cent., respectively, of that delivered by the generator, while for a smaller load at 9 P. M. the respective percentages decrease to 47.6 per cent. and 48.6 per cent. in spite of the fact that the apparent energy delivered by the generator is in the latter case only half as great as in the former. These results are due to changes in the angle of lag caused by changing the load.

In the canon curve of March 8th, the load at 9.30 P. M is seen to have increased considerably, although the sub-station loads were decreasing. This increase was due to the fact that the rain, which had previously ceased to fall at Pomona, began again.

The electrical resistance of the Pomona circuit is 74.9 ohms and that of San Bernardino 156.4 ohms at about 90 degrees F.

The insulation resistance of the circuits varies from far beyond the limits of an 11-megohm bridge in dry, hot summer weather to as low as 0.65 megohm during light rain. The latter value is that obtained with the two San Bernardino wires in series, and represents an insulation-resistance per mile of over 37 megohms. On a clear, sunny day the insulation-resistances of one Pomona wire and of one San Bernardino wire were respectively 11 megohms and 5½ megohms, which are in the exact relation which would be expected.

The lines cannot be tested for grounds or for continuity with a magneto bell, as their capacity is such that the bell will ring loudly when the wire is perfectly insulated and the circuit open. This capacity also prevents the use of the ordinary converter test for line leakage, as the lamp on the secondary will burn as though there were a ground even when the line is perfectly clear. By adding lamps, however, the light may be cut down until the last lamp added extinguishes them all. This would not occur if the light of the first lamp was due to a difference of potential on the primary caused by a ground, as then the added lamps would become as bright as the first.

The primary current is thus seen to be limited, and to be due to the capacity of the line. If the proper number of lamps has been added to just secure darkness when the line is known to be free from grounds the converter may be used to show grounds on that line, since the presence of a ground will cause all the lamps to brighten. The line test should only be made after ascertaining with one lamp that the generator is not grounded, as otherwise the leakage current for the greater number of lamps might burn the insulation of the generator.

(To be continued.)

BOOK REVIEWS.

AMERICAN ELECTRICAL CASES. Vol. III. Published by Matthew Bender, Albany, N. Y.

Three volumes of this excellent series have now appeared within less than a year. The third volume contains 110 cases, selected from those decided between July 1, 1889, and January 1, 1892. During this time many interesting questions arose which are discussed in these opinions. To illustrate this: Ten of them relate to the interference of stronger with weaker electrical currents, involving the questions of induction and conduction and the reciprocal rights and duties of different uses of electricity, while eighteen relate to the rights of owners of land abutting on highways as against electrical companies occupying the streets.

There are valuable notes upon these as well as upon other subjects. Indeed, the notes are a useful feature of the series, not so much, perhaps, on account of their length, although there are quite exhaustive ones upon prominent topics, as because they furnish cross references which greatly facilitate the use of the volume. Many cases not reprinted in full are also abstracted in notes.

We are especially pleased with the index, upon which much labor has evidently been bestowed, and with excellent result. It is a combination of index with digest, arranged with a view of showing at a glance what the volume contains upon any given topic. It could hardly be better in plan or execution. The importance of keeping in touch with the growth and development of the law of electricity can hardly be over-estimated and the lawyer in general practice desiring to keep abreast of the times cannot afford to be without the American Electrical Cases.

The mechanical work is fine. Paper, type and plate work are of the best, and the make-up is all that could be desired. In one particular we note an improvement. The two preceding volumes were rather bulky; in this, although it contains practically the same number of pages, the publisher has, by using an almost imperceptibly thinner paper, quite materially diminished the thickness of the whole book and improved its appearance.

The publisher of this series has performed a valuable service to the electrical public. It not only makes the work of the regular attorney much easier, but it will enable any corporation of intelligent men to inform themselves as to their rights in various circumstances as established by previous decisions. It should materially lessen litigation and is entitled to rank as a great educator.

We hope that before the work is completed Mr. Bender will add a volume covering the decisions in all American electrical patent cases. There is nothing of this kind in existence so far, and it ought to be a profitable addition to the series. It certainly should find a place in the library of every student of the art.

The set is bound in full sheep, and the practical work is of a much higher grade than one is accustomed to seeing in ordinary law books.

(Vol. I, 915 pages; Vol. II, 935 pages; Vol. III, 893 pages; $6 per volume.)

General News.

What is Going on in the Electrical World.

Granville, N. Y.—A new electric plant is to be established here. Address the village clerk for details.

Lanesboro, Pa.—Surveys are being made for the construction of an electric road between this place and Susquehanna.

Mt. Airy, O.—The construction of an electric railway from this place to Venice, a distance of 18 miles, is contemplated.

Old Orchard, Me.—The construction of an electric road between this place and Kennebunkport at an early day seems probable.

Montgomery, Ala.—The Montgomery Cotton Mills, Montgomery, Ala., wants an electric light plant of 200 sixteen candle-power lights.

Canton, Miss.—N. W. Latimer, city clerk, can furnish detailed information as to the new electric light and waterworks plant to be erected by this city.

Kalamazoo, Mich.—The electric light plant, recently bid in by Cahill & Tate, has been purchased by Col. G. Edwin Dunbar, who will run it himself.

Minneapolis, Minn.—A petition has been presented to the court asking that the Globe Electric Light and Power Company be dissolved.

New York.—The partnership of Noll & Sibley has been dissolved. The business will be conducted as heretofore under the name of C. C. Sibley & Co.

Ottawa, Can.—The Ottawa Improvement Company intends to build a dam at Chaudiere Rapids and use the water power obtainable there in producing electricity. Fully 10,000 horse power can be secured.

Bronson, Mich.—Messrs. Bond & Rheubottom, of Union City, have been granted a 15 year franchise to establish an electric light plant in Bronson. Work on the plant will begin immediately.

Colorado Springs, Col.—A company has been organized, to be called the Garden and Glen Electric Road, for the purpose of building an electric line to the Garden of the Gods, a distance of two miles. The right of way has been secured.

Newburg, N. Y.—One of the new double-decker trailers for the Newburg and Orange Lake electric road has been received by the company. It is much admired, and reflects credit on its makers, the J. G. Brill Company of Philadelphia.

Riverton, Pa.—The Cumberland Valley Traction Company has purchased the rights and franchises of the New Cumberland and Riverton Electric Company. This latter is the company that was chartered to build an electric road from New Cumberland to Riverton and Shiremanstown.

Auburn, N. Y.—The street railway that the Auburn Inter-Urban Electric Railroad Company proposes to build will be about twenty-five miles long, extending from the northerly end of Jackson street in Auburn to a point on the "island" at the foot of Owasco lake.

McKeesport, Pa.—An application is before the court for the building of a new road from McKeesport to Rostraver township, a distance of nine miles. If the action of the court is favorable, the McKeesport and Port Vue Traction Company will build an electric line along the new road.

Flushing, Mich.—Proposals will be received until August 20 by W. H. J. Martin, president of the village council of Flushing for waterworks and electric light machinery and construction. H. H. Humphrey, electrical and mechanical engineer, of Detroit, may be applied to for information.

Boston, Mass.—The Railroad Commissioners have issued an order making it imperative that all electrically operated street cars shall be heated by electricity; those now heated by stoves must adopt electrical heating as soon as the stoves are worn out. All new roads are required to put in electric heaters.

City of Mexico.—General John B. Frisbee, of this city, formerly of California, has just received a concession for an electric railway from Julipa on the Inter-Oceanic Railway to Coroba on the Vera Cruz Railway, passing through an extensive coffee and fruit country. This is the first electric railway projected in the republic of Mexico.

Atchison, Kan.—The Atchison Railway, Electric Light and Power Company has its new machinery in operation and it is giving the utmost satisfaction. The dynamo is of the Wood type compound alternating, of 3 000 lamp capacity, and was furnished by the Fort Wayne Electric Corporation. A 2,000-light dynamo and a 125-light arc machine will be added at once. In addition to this, one of the railway generators now furnishing power will be replaced by one of 260 horse power.

Richmond, Ind.—For some months a number of capitalists in Wayne, Fayette and Union counties have contemplated the construction of an electric railway to touch the principal points in the three counties, and now it is announced that the line is assured. It will be sixty-five miles long, and open up the finest section in the eastern part of the State. It is estimated that the cost of putting the line through complete to carry both passengers and freight will be $700,000. Motors of a powerful make will be used for the freight traffic.

Gorham, Me.—The Portland Extension Railroad Company has been organized for the purpose of building an electric road from the terminus of the Portland Railroad Company in Westbrook to Gorham. The directors of the new company are Wm. G. Davis, Wm. R. Wood and Charles F. Libby, of Portland; Edward A. Newman, of Deering, and Wm. Wheeler, of Brooklyn, N. Y. The company is separate and distinct from the Portland Railroad Company, and will build and operate its own track and its own rolling stock, but will lease power of the Portland Railroad Company.

Savannah, Ga.—The bondholders of the Savannah and Atlantic Railroad, better known as the Tybee Railroad, have refused to accept the plan of reorganization proposed by the committee of the Central Railroad Company. It is the idea of the committee representing the bondholders, when they secure possession of the property (which was transferred to the Central Company on guarantees that have not been fulfilled), to make such improvements in the road bed and superstructures as will secure them against damage by storms, and to equip the line for electric cars

Detroit, Mich.—The Michigan Electric Company of Detroit has recently completed an arrangement with the General Electric Company and the Edison Illuminating Company, of Detroit, covering the selling agency of General Electric machinery and supplies in Michigan, and consequently the General Electric Company will at once close the office they have maintained in Detroit. This arrangement covers the entire line of General Electric manufactures, including lighting generators, motors, incandescent lamps, and all their various lines of machinery and supplies.

Harrisburg, Pa.—It is announced that a charter has been granted by the State department to the Gettysburg, Baltimore & Washington Railroad Company, with a capital stock of $750,000. The line is to run from Cemetery Hill, near Gettysburg, to Biddle's Mills, at or near the Maryland State line, with branch connecting with the Round Top extension of the Gettysburg and Harrisburg near the Little Round Top. It will be some thirteen miles long. E. M. Hoffer, of Hummelstown, president of the Gettysburg Railway Company, is the principal stockholder and president of the new company.

Philadelphia.—The stockholders of the street railway companies that were recently consolidated are sending in their acceptances by the thousands. The officials of the roads say that not a dissenting voice has yet been heard.—The Gerson Electrical Manufacturing Company, of Philadelphia, has filed an assignment to Geo. W. Wilgers.—Draughtsmen at the Baldwin Locomotive Works have been busy lately working up plans for the trucks to be placed upon the new type of electric locomotive which the Baldwin Westinghouse combination intend producing. It is probable that the completed locomotive will be ready for inspection in about three weeks.

Chicago, Ill.—The *Times* says: "Suburban residents along the lines of the Chicago and Northern Pacific and the Chicago, Burlington and Quincy railroads will soon be able to ride to and from the city on swift-running electric trains. The Northern Pacific is about to substitute electricity for steam on its line, and a new corporation is planning an extensive system of trolley lines along the Burlington to reach the towns of La Grange, Grossdale, Austin, Ridgeland, Oak Park and Lyons. The improvement proposed by the Northern Pacific contemplates the use of electric power instead of steam over its entire system, and is regarded by railroad men as one of the most important departures of years."

Niagara Falls, N. Y.—George M. Johnson of Buffalo, who is interested in a current water motor patented by William H. Britton, also of Buffalo, has been trying to interest local capitalists in another power scheme. Mr. Johnson states that the Niagara Falls and Lewiston Railroad people are considering putting in the motors along the line of the lower river and generating electricity by means of them for the propulsion of their cars. Mr. Johnson claims that electric energy can be generated by means of the motors and sold at Niagara Falls at from $5 to $8 per horse power. He claims they can be used all along the upper river on both shores. Models are on exhibition here.

Spokane, Wash.—Albert E. Humphreys and Martin King have inserted a notice in the Spokane papers announcing their intention to form a company under the name of the "Trail Creek Tramway Company" (limited liability), for the purpose of building, constructing, equipping and operating a tramway commencing at a point on the west bank of the Columbia river at or near the mouth of Trail creek and running to the mineral claim Iron Horse, situated on Monte Cristo mountain, in the Trail creek mining division of the district of West Kootenay, and also a telephone and telegraph line in connection therewith, with power to build, construct, equip and operate branch lines to the Columbia, Kootenay, and any other mineral claims in the said Trail creek mining division.

Albany, N. Y.—The Superintendent of Public Works has given Mr. Frank W. Hawley permission to use the level of the Erie Canal between Buffalo and Tonawanda in experimenting with the Cooper & Hewitt system of propelling canal boats with electricity. The experiment will take place September 25. It will be witnessed by the State officers and expert electricians from various parts of the United States.—The State Board of Railroad Commissioners has granted the application of the Utica and Herkimer Street Railroad Company to build a branch. This was the first application made by a street railway under section 9 of the railroad laws, which prescribes that street railways in future must apply to the commissioners for permission to operate a new line or extend one.

Nevada City, Cal.—The Nevada County Electric Power Company, a new corporation, proposes to operate the machinery of the mines hereabout by electricity. Water power to energize the dynamos will be obtained by damming the south fork of the Yuba River and conducting the water by means of a flume to the electrical power house to be erected at a point about four miles from Nevada City, to which place, and thence to Grass Valley, current will be transmitted by wire. The contract for the electrical machinery for a preliminary plant, which includes two 450 H. P. generators, has been let to the Stanley Electric Company of Pittsfield, Mass. The system to be used will be the "two phase alternating." W. F. C. Hasson, Andrew H. Hunt and W. R. Eckart are the contracting engineers.

Washington, D. C.—Work on the Washington and Great Falls Electric Railway is being pushed by the contractors, who hope to have the line ready for traffic by the end of the present month. The route chosen for the road is one of much scenic beauty, and among other attractions along the line will be the National Forum of Glen Echo and its Chautauquan amphitheatre, built to accommodate 10,000 persons, which, besides its lectures, musicales and didactic entertainments, can be made available for conventions, festivals and other things promotive of patronage.—The Rock Creek (Chevy Chase) Electric Railway Company has made a deal with the Washington and Georgetown Railway Company by which both companies will operate as one under the name of the Capital Traction Company.

"Two to Fifteen Days' Pleasure Tours."

(No. 8 of the "4-Track Series.")

This is a beautiful little book of sixty-four pages, narrow octavo, printed in two colors, issued by the Passenger Department of the New York Central, from the press of the Matthews-Northrup Company Complete Art Printing Works, Buffalo, N. Y.

It describes a series of tours occupying from two to fifteen days, arranged for the purpose of meeting the wishes of all classes of travellers, including trips to the Thousand Islands, Montreal, Saratoga, Lake George, the Catskill Mountains, Niagara Falls, Chautauqua, Adirondack Mountains, Berkshire Hills, Richfield Springs and many other famous resorts. Information concerning these trips is given—distances, time, fares, connections and all other details—with much precision. It contains ten maps engraved expressly for this work, and is profusely illustrated with a large number of new and beautiful half-tone engravings. A glance over this little book will convince you that the attractions of the New York Central are equaled only by their merit, and afford a choice which will suit every taste and every purse.

"Two to Fifteen Days' Pleasure Tours" will be sent free, post-paid, to any address in the world, on receipt of two 2-cent stamps, by George H. Daniels, General Passenger Agent, New York Central and Hudson River Railroad, Grand Central Station, New York.

COMMERCIAL PARAGRAPHS.

R. D. Nuttall Company, Allegheny, Pa., manufacturers of the Nuttall Trolley and other well known street railway specialties and supplies, have to run their factory double time to keep up with orders.

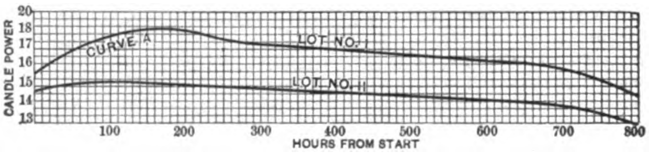
In order to give the business his personal attention Mr. W. D. Packard has assumed the general managership of the Packard Electric Company's plant at St. Catharines, Ontario. The factory has been equipped throughout with new and improved machinery, and is now in full operation manufacturing the well-known Packard lamps and transformers.

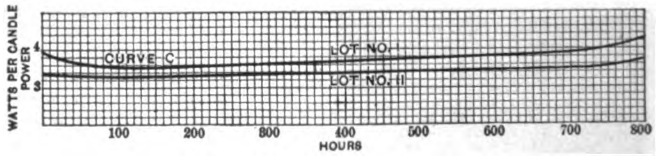
Some Recent Lamp Tests.

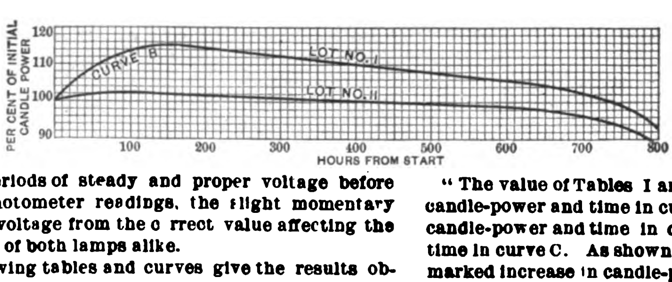
The following extracts are taken from the report of Prof. B. F. Thomas of the Ohio State University, Columbus, O., who recently completed a very interesting test of a make of incandescent lamps for which some very remarkable claims have been put forth as to the maintenance of candle power, increase (instead of decrease) in the efficiency of the filament during burning, etc.:

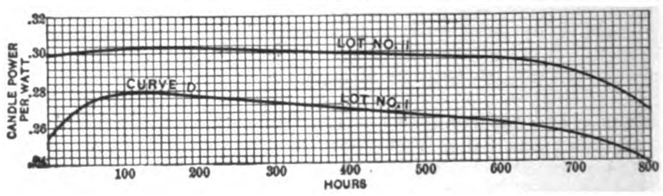
"Weston instruments were used for the current strength and voltage. For candle-power readings, a Sumner-Brodhun sighting box was adapted to an accurately graduated portable photometer bar, .00 inches long. The lamp under test was placed at one end of the bar, and a 100-volt 16 candle-power lamp, which had been used some time, was placed at the other end and served as a working standard. One hundred lamps, labeled '16 C. P., 100 volts,' were obtained for this test. They were about equally divided in two lots, having distinguishing marks inside the bulbs. Twenty-five lamps were taken at random from each lot for test. The mains from the station circuit were kept at as nearly constant potential as possible by an attendant at the switchboard, but the running of a motor on the circuit caused momentary abnormal changes in voltage. No attempt was made to secure unusual constancy for the reason that the circuit arrangement used enabled us to work the lamps under the conditions ordinarily existing in central station practice. The results may therefore be considered as a better indication of what lamp users may reasonably expect from similar lamps than if the lamps had been run at an unvarying voltage. From readings taken on different days, and at different times of day, the average voltage was about 99.

"The lamps under test, and the test lamp itself, were all in parallel, such arrangement making it unnecessary to wait for periods of steady and proper voltage before taking the photometer readings, the slight momentary variations of voltage from the correct value affecting the candle-power of both lamps alike.









"The following tables and curves give the results obtained. Tables I and II give for each of the lots 1 and 2 the number of lamps burning, the observed candle-power (average of each lot), and the average watts per lamp, at the several times at which readings were taken. From these readings the percentage of initial candle-power, the efficiency, and the candle-power per watt were computed and inserted in these tables:

TABLE I.

TEST OF PACKARD LAMPS, MAY, 1895.

Average of Lot No. 1.

Hours from start of test.	Number lamps burning.	Candle power.	Per cent. of initial candle power.	Watts per lamp.	Watts per candle power.	Candle power per watt.

400	175.530	628.0	130.60	.0744
500	216.4 0	779.3	160.86	.0743
600	256.090	929.9	190.93	.0746
700	292.100	1071.2	219.24	.0751
800	32 .5 0	1207.7	246.54	.0757

NOTE.—Cost of light based on an assumed price of 20 cents per lamp and 20 cents per kilowatt hour. Figures in last column obtained by dividing cost in fourth column by corresponding figures in second column.

TABLE IV (Lot 2)—*Economic Results.*

Hours from start.	Total candle power hours.	Total kilo-watt hours	Total cost of light.	Average cost in cents of 1 C. P. hour.
100	37.320	124.50	$29 90	.0801
200	75.0 0	249.90	54.98	.0733
300	112.370	374.80	79.96	.0712
400	147.940	494.20	103.84	.0702
500	188.220	613.20	127 64	.0677
600	218.170	731.70	151.34	.0694
700	252.130	844.40	174.88	.06936
800	284.360	966.10	198.22	.0697

NOTE.—Cost of light based on an assumed price of 20 cents per lamp and 20 cents per kilowatt hour. Figures in last column obtained by dividing cost of light in fourth column by corresponding figures in second column.

"The value of Tables I and II are plotted in terms of candle-power and time in curve A, of percentage of initial candle-power and time in curve B, and of efficiency and time in curve C. As shown by these curves, lot 1 shows a marked increase in candle-power on the start, reaching a maximum of 17.9 candles at about 175 hours, then decreases uniformly until 600 hours, when a more rapid decrease sets in. The candle-power does not fall to its initial value of 15.54 candles until over 700 hours from the start. Lot 2 shows only a moderate rise in candle-power with a maximum of about 150 hours, and then decreases uniformly to its initial value at 400 hours: curve C shows a marked increase in efficiency for lot 1 on the start, falling back to the initial value only after 600 hours. Lot 2 improves in efficiency also at the start, though to a smaller extent, and continues at a practically uniform figure for 600 hours. The decrease in efficiency for each lot after 600 hours is much less rapid than that usually met with.

"Tables III and IV give the total kilowatt hours spent on each lot of lamps and show the total cost of light and average cost in cents of one candle-power hour.

"It will be noticed that the breakage is remarkably small. No lamp of either lot showed any serious blackening, and the majority of the lamps were scarcely blackened at all."

The report ends by saying, that "taking economy, maintenance of candle-power and freedom from blackening into account, the results obtained are much superior to any heretofore published, and the New York and Ohio Company, of Warren, Ohio, whose lamp, the well-known 'Packard,' was used in this test, are to be congratulated upon their achievement in the manufacture of incandescent lamps."

BUSINESS HINTS.

Public Buildings, Theaters, Residences, &c., Proposed or in Course of Construction.

[The following summary is prepared weekly for ELECTRICITY for the information of advertisers and readers who are dealers in apparatus and articles required in the electrical equipment of public and private buildings.]

Atlantic City, N. J.—It is reported that C. A. Bradenburg, of Philadelphia is contemplating the erection of a hotel and theater building here to cost about $250,000.

Brooklyn, N. Y.—Plans have been prepared by Architect John Smith for a four story apartment house at 9.4 Bedford ave.

Cambridge, Pa.—A new hotel building is to be erected on Beach ave. at an estimated cost of $250,000; every modern improvement will be introduced; the structure will contain a theater, bath rooms, natatorium and a roof garden; it will be known as the Hotel Al Monte.

Chicago, Ill.—Plans have been prepared by J. D. Howath, Dearborn st., for a five story bank and hall to be erected for A. Kopperl, 569 South Canal st.; electric lighting and other improvements will be introduced... A six story factory is to be erected for M. D. Colfeen, Washington st., at a cost of $125,000; the specifications call for all modern improvements, including electric lighting.

Germantown, Pa.—A new residence is to be built for Mrs. W. Morris, at Overbrook, at an estimated cost of .40,0 0. The specifications call for every modern improvement.

Knoxville, Tenn.—A theatre building is to be erected for the Grand Opera House Co. at a cost of $60,000; the structure will be wired and fixtured throughout for electric lighting.

Lock Haven, Pa.—The opera house at this place is to be improved; a new electric lighting system will be introduced.

Rahway, N. J.—It is reported that a new electric lighting system is to be established here; address the clerk of the council.

St. Louis, Mo.—A fine edifice is to be erected for the Cumberland Presbyterian Church, after plans prepared by Architect Charles E. Ilsley; among the improvements introduced will be electric lighting....Plans have been prepared by J. L. Wees for a market and store building to be erected at a cost of $200,000; specifications call for passenger and freight elevators, steam heating, etc.

Tampa, Fla.—A new fire-proof hotel building is to be erected here by J. A. Wood and others at an estimated cost of $20 ,000.

Newark, N. J.—Architects McKim, Mead & White, of New York City, have prepared plans for a handsome residence for Robert W. Cumming, at 368 Mt. Prospect ave., this city; the structure will be provided with every modern improvement.

New York City. Architects Cady, Berg & See have completed plans for a new five story building to be erected in connection with the Museum of Natural History at a cost of $300,000; the structure will be equipped with the latest conveniences; a new electric plant will be installed.

to consist of a 150 horse-power engine and 100 K. W. dynamo ..Plans have been prepared by John G. Pangue for a seven story warehouse at 169 Mercer st.... Architects Clinton & Russell have prepared plans for 5 six story dwellings to be erected at 12- 0 West 55th st., for Wm. R. Montgomery, 2715 Creston av ..... A five story dwelling is to be built at 138 Waverley Place by Rev. G. P. O'Flynn; Architect George H. Stenton; the specifications call for the most modern improvements.... The club house at 111-119 East 58th st. is to be altered for the German Liederkranz Society; the plans call for the latest improvements.... Plans have been prepared by Architect Edward Wenz for 5 five story flat buildings to be erected on 102d st. for John Sturck & Co.; all modern improvements will be introduced.

Oquawka, Ill.—Plans and specifications have been prepared for the erection here of an opera house block by Wm. Wolf, of Galesburg.

Philadelphia, Pa.—Plans have been prepared by T. W. Roos, of New York, for a new ten story fire-proof building for the New York Mutual Life Insurance Co. at 1007-10 1 Chestnut st., at a cost of $800,000; the structure will be wired and fixtured throughout for electric lighting.

Providence, R. I.—The new club house which is to be erected for the Harbor View Club on Thames st. is to be wired and fixtured throughout for electric lighting; Architect Charles F. Chase prepared the plans; H. F. Minsher is secretary of the club.... Plans have been prepared for a four story brick and stone building on Mathewson st. by Benjamin D. Weeden; passenger elevators and all modern improvements will be introduced.

INCORPORATIONS.

The Central Light and Power Company, Montreal, Can.—to construct and maintain works for the manufacture of electrical machinery, apparatus, etc. Capital stock, $50,0 0. Incorporators: Richard White Edward H. Barker, Frank E. Kane and others.

The East Orange Electric Company, East Orange, N. J.—to establish and maintain electric plants for heat, light, power and telephone service. Capital stock, $150,0 0 Promoters: Roderick M. Sanger, Chas Jacobus, Alfred Lindsay, Montgomery Lindsay, East Orange; Wm. E. Runkle, Newark, N. J.

The New Bethlehem Electric Company, New Bethlehem, Pa.—to supply light, heat and power, etc, by means of electricity. Capital stock, $1,000. Promoters: John B. Thompson, Geo. L. Thomas, C. E. Andrews, W. M. Andrews, J. R. Foster, G. A. Berger, R. F. Mateer, F. L. Andrews, W. J. Mateer, S. Taylor Sheaffer, New Bethlehem.

The Fox River Development Company, Chicago, Ill.—to construct, operate and maintain water works, sewers, drains and electric light plants; lay water mains and supply pipes, and string electric light and power wires, etc. Capital stock, $100,000. Promoters: Preston W. Gray, John B. Ruhland, Thos. R. Cone.

The Kaweah Irrigation and Power Company, Visalia, Cal.—to acquire, buy and sell water and water rights; furnish power developed by water, electricity or other means; acquire, construct, operate and sell electrical railroads and electric plants; carry on a general manufacturing and merchandise business. Capital stock, $800,(00. Promoters: Elisha C. Ware, Chicago, Ill.; A. G. Wishon, Tulare; Geo. Hanna, John A. Pirtl, Los Angeles; O. C. Ainsworth, Pasadena, Cal.

The Homestead and Calhoun Park Street Railway Company, Homestead. Pa.—to engage in the conveyance of passengers by power other than locomotive Capital stock, $18,000 Promoters: Nathan H. West, Thos. L. Brierly, Geo. Gladden, Jas. B. Neel, Robt. M Elliott, John F. Milliken, Reid Kennedy, Joseph A. West, Homestead.

The Winchester Gas and Electric Light Company. Winchester, Mass.—to make and generate gas and electricity for lighting, heating, cooking, and furnish mechanical power. Capital stock, $50,000. Promoters: Lewis C. Pattee, president; David N. Skillings, treasurer; Hales W Suter, N. T. Apollonio, F. J. O'Hara.

The Salt Lake Citizens' Electric Light Company, Leadville, Col.—to construct and operate a system for furnishing light and heat, also power, in Lake County, Col., and Salt Lake County, Utah. Capital stock, $500,000. Promoters: Chas. Boettcher, John F. Campion, Geo. W. Trimble, Leadville.

The Island Pond Electric Light and Power Company, Island Pond, Vt—to acquire and own real estate, and conduct all transactions incident to a general electric lighting business. Capital stock, $10,000. Promoters: Geo. H. Fitzgerald, Z. M Mansur, H. E. Fitzgerald, L. A. Cobb, E. W. Bartlett, Island Pond.

The Northern Electrical Manufacturing Company, Madison, Wis.—to manufacture motors, dynamos, generators, etc. Capital stock, $50,000. Promoters: D. C. Jackson, C. M. Conradson, V. O. Fox, W. F. Vilas, Madison.

The Highland Park Passenger Railway Company, Pittsburg, Pa.—to engage in the conveyance of passengers by electric power. Capital stock. (0.000. Promoters: Wm. B. Rhoads, Joshua Rhoads, Allegheny; O. S. Decker. Robt. S. Frazer, Pittsburg; W. C. O'Reilly.

The North Susquehanna Transit Company, Danville, Pa.—to engage in the conveyance of passengers by electric power. Capital stock, $135.00 . Promoters: E. S. Whitney, Robt. E. Wright, Allentown; Edward R. Spousler, J. M. Fitzgerald, Wilson M. Gearheart, Harrisburg; James Scarlett, R S. Ammerman, John K. Gerringer, Danville, Pa.

The Pine Plains Light Company—to supply gas and electricity in Pine Plains, Dutchess County, N. Y., and suburbs. Capital stock, $10,000. Directors: John R. Thompson and Newton Hebard, of Amenia; Frank Eno, Frederick Bostwick, W. Bostwick and Charles S. Wilbur, of Pine Plains.

The Burton Electric Company of California, San Francisco, Cal.—to supply electricity for the heating, forging, smelting, welding and working of metals, minerals, ores, chemicals and gases; deal in all kinds of electrical machinery and inventions, etc. Capital stock, $1,000,000. Promoters: Geo. C. Perkins, J. R. Kendall, Oakland; John C. Richards, N. A. Harris Geo. E. Davis, G. A. Warner, San Francisco; Geo. D. Burton, Boston, Mass.

The Newark Electric Developing Company, Newark, N. J.—to manufacture electric appliances and machinery and to sell the same. Capital stock, $100.000. Promoters: Augustus Demarest, Eugene Eagles, Chas H. Madison, James H. Reinhardt, Newark, N. J.

The Delaware County Gas Manufacturing Company, Camden, N. J.—to manufacture and construct machinery, works, etc., for heating, cooking or lighting, and supply gas, electricity, etc., for heating, cooking or lighting, etc. Capital stock, $150,0 0. Promoters: C. Hazletine Basshor, H. C. Turnbull, Jr., Baltimore, Md.; John W. Baker, John J. White, Chas. L. Lagen, Philadelphia; Lewis Starr, Woodbury, N. J.

The Elliott Magnetic Electric Company Chicago, Ill.—to manufacture and sell the Elliott magnetic electrical and mechanical appliances for railway and other purposes and sell the right to persons to manufacture and sell the said appliances Capital stock, $1,000,000. Promoters: Wm. R. Elliott, Isaac C. Robbins, Chas. A. Emmons.

The Connersville Electric Light Company, Connersville, Ind.—to manufacture and produce electricity for illuminating and motive power. Capital stock, $15,000. Promoters: Edward W. Ansted, Wm. Newkirk, John B. McFarlan, James N. Heron, Thos. Downs.

The Dayton Electric Fire Alarm Company, Dayton, Ohio—to manufacture all kinds of electrical apparatus, machinery and appliances. Capital stock, 10,000. Promoters: Elihu Thomson, Samuel G. Cain, Newton R. Bunker, Harvey Cortland, Albert Beebe.

The Seattle and Rainier Beach Railway Company, Seattle, Wash.—to improve and operate the Rainier Avenue electric lines, which they have purchased. Capital stock, $30,000. Incorporators: Herman Chapin, E. W. Andrews and Josiah Collins.

The Portchester, Rye, Harrison and White Plains Electric Railway Company has filed certificate of incorporation at Albany, N. Y.; the company was organized to build an operate and electric railway connecting the towns named in the title. Capital stock, $150,000. Directors J. W. Lounsbury, William Ryan, J. O. Merritt, H. M. Henderson, William L. Ward, J. W. McCarthy, of Portchester; Charles D. Haines, of Kinderhook; Ebenezer Bull, of Harrison, and Frank Schirmer and John O'Rourke of White Plains, N. Y.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED AUGUST 6, 1895.

ELECTRIC RAILWAYS AND APPLIANCES.

543,867. Construction and Operation of Electric Railways and Tramways. Isaac W. Heysinger, Philadelphia. Pa. Filed April 11, 1892.

544,037. Converter System for Electric Railways. Thomas Harper, New Brunswick, N J. Filed June 29, [illegible]894.

544 05[illegible]. Conduit System for Electric Railways. James Thomas and William R. Thomas, Catasauqua, Pa. Filed Dec. 6. 1894.

544,157. Trolley-Wheel. Jesse Conway, Baltimore, Md., assignor of five-eighths to James F. Morrison, same place. Filed Jan. 4. 1895.

544,198. Electric Railway. Francis Taylor, Charlotte, N. C., assignor of one-half to Irvin W. Durham, same place. Filed Nov. 30, 1894.

544,209. Electric Railway and Tramway. Jean Claret, Lyons and Olivier Wuilleumier. Clermont-Ferrand, France. Filed July 25, 1893.

ELECTRIC LIGHTS AND APPLIANCES.

543,[illegible]92. Method of and Means for Extinguishing Electric-Arcs. William B. Potter, Schenectady. N. Y., assignor. by mesne assignments, to the General Electric Company, same place. Filed Nov. 30, 1894.

543,900. Electric-Arc Lamp. Charles E. Scribner, Chicago, Ill, assignor to the Western Electric Company, same place. Filed March 12, 1891

543,[illegible]65. Incandescent Conductor for Electric Lamps. Thomas A. Edison, Menlo Park, N. J., assignor to the Edison Electric Light Company, New York, N. Y. Filed Aug. 7, 1882.

543,98[illegible]. Filament for Incandescent Lamps. Thomas A. Edison, Menlo Park. N. J., assignor to the Edison Electric Light Company, New York, N. Y. Filed Oct. 20, 1882.

544,034. Electric-Lighting System. Edward F. Gavin, New York, N. Y. Filed Sept. 28, 1894.

544,0[illegible]6. Electric-Arc Lamp. John A. Mosher, Chicago, Ill. Filed May 11, 1895.

DYNAMO ELECTRIC MACHINERY.

543,836. Alternating-Current Motor. Engelbert Arnold Zurich. Switzerland Filed Oct. 9, 1894.

543,89[illegible]. Construction of Armatures for Dynamo-Electric Machines. William B. Sayers, Bearsden, Scotland. Filed Aug 16, 1894

543,907. Controlling Phase Relations. Charles P. Steinmetz, Lynn, assignor to the General Electric Company, Boston. Mass. Filed Sept. 9, 1893.

543,9[illegible]0 System of Electric Distribution. Elihu Thomson, Swampscott, assignor to the General Electric Company, Boston, Mass. Filed June 28, 1894.

544,094. Automatic Cut-Out for Electrical Converters. William J. Greene, Cedar Rapids, Iowa. Filed May 9, 1895.

544,118. Safety Electric Motor. William R. Polk, Jr., Atlanta, Ga. Filed Feb. 20, 1894. Renewed Dec. 24, 1894.

544,236. Controlling-Switch for Electric Motors. William J. Pohlman, Woodbrook, assignor of one-half to J. Edgar [illegible]rrion, Baltimore, Md. Filed June 4, 1895

544,261. Alternating-Current Motor. Robert Lundell, Brooklyn N. Y. Filed Oct. 2[illegible], 1894.

TELEPHONE AND TELEGRAPH APPARATUS.

543 843. Telephone. John S. Biggar, San Francisco, Cal. Filed Nov. 16, 1894.

543,901. Telephone-Exchange. Charles E. Scribner, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Nov [illegible]2, 1894.

543,902. Apparatus for Telephone-Switchboards. Charles E. Scribner, Chicago, Ill assignor to the Western Electric Company, same place. Filed Dec. 8, 1894.

543,984. System of Multiplex Telegraphy. Thomas B. Dixon, Henderson, Ky. Filed Oct. 19. 1894.

544,077. Coin Signal Apparatus for Telephone Pay-Stations. Samuel Alexander, Hartford, Conn. Filed Nov. 13. 1893.

BATTERIES.

543,885. Electric Battery. Robert McL. McDonald and Alexander McDonald, Dalmuir, Scotland. Filed Nov. 18, 1894.

543,981. Primary Battery. George H. Gardner, Boston, Mass. Filed July 5, 1894.

544,180. Machine for Making Battery-Plates. Thomas T. Lewis, Philadelphia, Pa Filed March 28, 1894.

MISCELLANEOUS.

543,8[illegible]5. Short-Circuiting Device for Stopping Dental Motors. Francis N. Denison, Toronto, Canada. Filed Oct. 9, 1894.

543,865. Electric Meter. Jesse Harris, Lynn, Mass. Filed Oct. 4, 1894.

543,879. Automatically-Operated Fire-Alarm. Frank K. Ludlow, Madisonville, Ohio. Filed Dec 18. 1894

543,919 Method of Connecting Ends of Electric Conductors. John T. Beswick, Brooklyn, assignor to the General Incandescent Arc-Light Company, New York, N. Y. Filed Feb. 9, 1895.

543,929. Electric Temperature-Controlling Device. Sven A. Ekehorn, Milwaukee, Wis. Filed May 1, 1894.

543,933. Electric Signal for Railway-Trains. John C. Henry. Westfield, N. J. Filed April 20 1895.

543,960. Electrical Conductor. Gorham Gray, Boston, Mass., assignor to the Spiral Wire Company, Portland, Me. Filed Dec. 14, 1894.

543,963. Rheostat-Controller. Clyde Landers, Tacoma, Wash Filed March 27, 1894.

543,965. Electrical High or Low Water Alarm. Bernard McCabe, Boston, Mass. Filed Dec. 15, 1894.

543,966. Circuit-Closer. William Nutt, Crawfordsville, Ind. Filed Nov. 6, 1894.

543,978. Electric Condenser Charles S. Bradley, Avon, N. Y. Filed May 11. 1895.

544,015. Temperature-Regulator. George H Underhill and Ernst Glantzberg. Boston, Mass.; said Glantzberg assignor to said Underhill. Filed Nov. 17, 1893.

544,0[illegible]7. Rheostat. William O Meissner. Chicago, Ill. Filed Nov. 20, 1893. Renewed Jan. 11, 18[illegible].

544,084. Fire-Alarm Signaling Apparatus. Gilman W. Brown, West Newbury, Mass., assignor of one-half to Haydn Brown, same place. Filed Sept. 1, 1892.

544,107. Magneto-Electric Bell. Leland Moore, Brooklyn, N. Y., assignor of one-half to John C. Reilly, same place. Filed April 11, 1895

544,123 Electric Signaling System. Charles A. Rolfe, Chicago, Ill. Filed Jan. 8, 1895.

THE TELEPHONE WORLD.

THE BATTLE BEGUN.

The Bell Company Brings Suit to Test the Validity of the Berliner Patent of 1891.

The first decisive step of the American Bell Telephone Company to establish its alleged rights under the Berliner microphone patent of 1891 was taken at Boston on the 6th inst., when papers were served upon the National Telephone Manufacturing Company of Boston in a suit for an order restraining the National Company from alleged infringement of this patent. A hearing is assigned before the United States Circuit Court for the first Tuesday of September. J. D. Leatherbee, treasurer of the National Company, announces that his company will make a vigorous defence.

The National Company are manufacturers of a line of telephone exchange apparatus of which the "National" Granular Carbon Transmitter is a part. It is this form of apparatus which the Bell Company alleges infringes the Berliner patent.

While the Berliner patent has figured in the courts before, the present suit against the National Company is the first instituted by the Bell Company. In the bill in equity brought before the United States Circuit Court of the Massachusetts District in 1894, praying for the repeal of the Berliner patent of November 17, 1891, the Government was the plaintiff. It is well remembered that Judge Carpenter decided that the complainant had made out the case and that the patent was void and should be delivered up for cancellation, but the United States Circuit Court of Appeals, upon the appeal of the Bell Company, reversed this decision.

The National Company is not a member of the Telephone Protective Association, nor has it become identified with the organization of the Eastern Association. At a meeting of the executive committee of the former association, held in Cleveland on the 9th inst., it was concluded to take no action in the suit further than to send an attorney to Boston to determine what measures should be adopted.

New Companies Incorporated.

The Grenada Telephone and Telegraph Company, Grenada, Miss.—Capital stock, $250,000. Incorporators: B. L. Roberts, Emile Levy and H. W. Latimer.

The Columbia Telephone Company, Columbia, S. C.—Capital stock, $5,000. Incorporators: W. Y. Abrahams, W. B. Lowrance, F. D. Kendall, A. R Stewart, R. G. Johnstone, T. J. Harper and J. B. Friday.

The Standard Telephone Company of Washington and Baltimore.—Capital stock, $140,000. Incorporators: John W. Woodland, Bruce B. Gootee, Gen. Felix Agnus, Wm. S. Thomas and Robert M. Galt, all of Baltimore.

The Hamilton, Hughes and Monroe Telephone Company, Hamilton, Ohio. Capital stock, $5,000. Incorporators: C. E. Griesmer, F. M. Hughes, A. E. Schenck L. C. Shafer, J. E. Hughes and D. S. Rose.

The Rockport Telephone Company, Rockport, Texas—Capital stock, $10,000. Incorporators; C. W. Boothe, H. W. Crouse and E. A. Stevens.

The American Telegraph Supply Company, Atlanta Ga.—to manufacture and deal in telegraph supplies. Capital stock, $ 50,000. Incorporators: D. M. Dunn, F. J. Hoyle and S. H. Howell.

Coming the Western Company's Way.

Among the recent contracts secured by the Western Telephone Construction Company, Chicago, are the following: The Ticonderoga Telephone Company, Ticonderoga, N. Y., complete exchange equipment; the Elgin City Railway Company, Elgin, Ill., private system; the Altoona Phœnix Telephone Company, Altoona, Pa., complete exchange; the Wapokoneta Telephone Company, Wapokoneta, O., complete exchange; the Lansing Telephone Exchange Company, Lansing, Mich., 400 subscriber exchange complete; Barnesville, Ohio, complete exchange apparatus.

The Gerson Company Assigns.

The Gerson Electrical Manufacturing Company of Philadelphia, makers of the "Gerson" telephone and accessory apparatus, filed a deed of assignment on the 7th inst. to George W. Wilgus. The deed is dated July 15 and conveys no real estate. A schedule of the assets and liabilities has not yet been given out.

Milde Will Defend.

The Standard Telephone and Electric Company of Madison, Wis., which controls the Milde microphone patents in the United States, has received advices from Ch. Milde, of Paris, the inventor, that his patents will be defended against all claims for alleged infringement. Milde asserts that his microphone is non-infringing and will not be affected by the Berliner decision. He says:

"The principle of microphony is of course the same in our microphone as in every other microphone. But a principle cannot be patented, and such principle was known long before Berliner ever thought of making a microphone."

To Complete the Organization.

The representatives of the independent telephone companies comprising the Eastern Protective Association will meet in New York on August 15, to complete the work of organization and to map out a plan of campaign.

Resists the Tax.

The Western Union Telegraph Company has refused to pay the recently imposed tax of $20 for each telegraphic instrument in use in the State of Montana. Suit has been brought at Helena to test the law.

Some time since the New York and New Jersey Telephone Company secured a temporary injunction against the Elizabeth Mutual Telephone Company, Elizabeth, N. J., on the ground that it had not been organized under the State law governing such companies. The only alternative was for the company to reorganize, which was done a few days ago by the election of William H. Rankin as president, Peter Egenolf vice-president, Charles N. Trumble secretary, and Robert W. Waterbury treasurer. The new company will push the construction of its plant. A sharp cut in rates can be looked for when the new company gets its line in operation, which it expects to accomplish before October 1.

The Central Telephone Company has notified its local manager at Wabash, Ind., to reduce rates to subscribers below any rate which a rival company might make. The home company, composed of Wabash business men, will shortly open an exchange with 130 subscribers, and the Central Union people are determined, if possible, to drive it from the field. The home company rates are $2 and $1.50 a month, while the Central Union rates are $3 and $2. The Central Union has determined upon a bitter rate warfare, and within three months it is predicted will be furnishing service free.

In exchange for a franchise at Indianapolis, Ind., the Central Union Telephone Company offers to place wires underground and to establish and maintain, free of expense to the city, a new and modern police telephone system and to maintain the fire alarm telegraph. The Phœnix Telephone Company has also asked for local rights in that city, but the company has not yet organized so that it can enter into a contract with the city.

The Norristown and Philadelphia Telephone and Telegraph Company, in exchange for permission to construct a telephone line in Norristown, Pa., using the underground system, offers to pave all streets in which conduits are laid, to supply free phones for all borough offices and fire engine houses and pay to the borough annually 2½ per cent. of its net income.

O. D. Hardy, president; George Cockburn, vice-president; Jacob Stahl, treasurer; D. A. Reynolds, secretary and general manager; Walter Pratt, superintendent of construction, are the officers of the Lansing Telephone Company, organized at Lansing, Mich., with a capital of $25,000. The company proposes to commence business within sixty days.

The Jacksonville Telephone Company, Jacksonville, Fla., is to be incorporated with a capital of $30,000. M. B. Rice and W. M. Shine, of Tallahassee, and A. H. King, of Jacksonville, are the promoters. The company proposes to furnish telephones for $30 and $20 per annum. The canvassers have secured several hundred subscribers.

James F. Burns and others of Colorado Springs, Col., have filed articles of incorporation of the Colorado Automatic Telephone Company to operate the Strowger Automatic system in Colorado. The capital stock of the company is to be $500,000 and the principal office at Colorado Springs.

The Mutual Telephone Company, Petersburg, Va., will open its exchange in a few days with upwards of 300 subscribers. The Southern Bell Telephone Company has reduced its rates from $48 and $30 to $18 and $10 to meet the competition of the new company.

An ordinance has been submitted to the council of Terre Haute Ind., granting rights of way to the People's Telephone Company, which has been incorporated to do business in Edgar and Clark counties of Illinois, and Vigo, Vermillion, Parke, Clay and Sullivan counties of Indiana.

A movement is on foot to organize the Interstate Telephone Company at Trempealeau, Wis. The object is to span the Mississippi to the Minnesota side with a wire that will connect with the lines of the Northwestern Telephone Company now being constructed.

The Detroit Harrison Telephone Company, Detroit, Mich., has accepted all the provisions of the franchise granted by the city council except those relating to rates. The company will fix its own rates with subscribers.

The establishment of a long distance telephone line between Eufaula and Abbeville, Ala., may now be regarded as almost a certainty. As soon as a charter for the new company can be obtained a contract will be closed with a construction company.

The Chester and Philadelphia Telephone and Telegraph Company has asked for a franchise at Chester, Pa. The local Bell Company has taken no action yet on a petition of its subscribers to reduce rates one-half.

The officials of the Chesapeake and Potomac Telephone Company at Washington D. C., have declared the new telephones recently installed in the District offices in that city to be an infringement of the Berliner patent.

The Menominee Range Telephone Company, of Iron Mountain, is the first independent telephone company in the Upper Peninsula of Michigan. Subscribers are now being secured, and the exchange will be built at once.

Articles of incorporation of the Newark Telephone Company, Newark, N. J., have been filed. The company will do business in Newark, Hudson and Essex counties. Capital stock, $300,000.

The Tioga County Telephone Company, capital $2,500, and the Mt. Pleasant Mutual Telephone Company, capital $1,000, are two new Pennsylvania telephone companies.

J. G. McPhaul, a local capitalist of Sumner, Ga., is locating a telephone line from Poulan to Albany, by way of Tifton, Ga., the total length of which will be forty-one miles.

The Central District Printing and Telegraph Company, Pittsburg, will extend its telephone line from Uniontown, Pa., to Morgantown, W. Va., a distance of twenty-five miles.

The council of Haverhill, Mass., has rejected the proposal of the New England Telephone and Telegraph Company to place its wires underground in that city.

The Northwestern Telephone and Electric Company of Milwaukee will establish an exchange in Racine, Wis., if a franchise can be obtained.

The Saginaw Valley Mutual Telephone Company has asked for a franchise at Saginaw, Mich., proposing to give exchange service at $30 and $24 per annum.

A telephone company has been organized at Douglas, Mich., to connect Douglas, Saugatuck and Ganges with the outer world.

To meet the cut in rates made by the local company at Boone, Ia., the Iowa Union Telephone Company is giving free service.

The Berea, Kingston and Richmond Telephone Company has been organized at Berea, Ky., to construct a fifteen-mile line.

The Long Island line of the New York and New Jersey Telephone Company has been completed to Patchogue.

A telephone franchise has been granted by the council of Brazil, Ind., to F. C. Reagan and others of Lebanon, Ind.

J. H. Lovy can give information about the new telephone line to be constructed at Clarksville, Tenn.

A police signal telegraph system is to be installed at Greenville, N. J., at a cost of $8,50.

The Capital Telephone and Telegraph Company has been granted a franchise at Sacramento, Cal.

The construction of a telephone line from Brandonville, W. Va., to Somerfield, Pa., is contemplated.

A franchise has been granted to the Home Telephone Company, South Bend, Ind.

A telephone company has been organized at Lansing, Mich., with a capital of $30,000

The Postal Telegraph Company has been granted a franchise at Clinton, Ia.

A mutual telephone exchange company is to be organized at Staunton, Va.

Girard, Ohio, will soon have long distance telephone connection.

The telephone wires in Savannah, Ga., are to be placed underground.

ELECTRICITY.

VOL. IX. NEW YORK, AUGUST 21, 1895. No. 6

ELECTRICITY

Published every Wednesday by the

ELECTRICITY NEWSPAPER CO.

B. E. GREENE, PRES'T. L. J. MONTGOMERY, SEC'Y.

PUBLICATION OFFICE:

6 Park Place - New York

EDITORS: NELSON W. PERRY.
BURTON E. GREENE.
R. H. WILLOUGHBY.

BUSINESS MANAGER, - - JOHN L. GANS.

SUBSCRIPTION RATES:

UNITED STATES, - - - - -	$2.50
IN CLUBS OF FIVE OR MORE, - - - - -	$2.00
FOREIGN COUNTRIES, - - - - - -	$4.50
SINGLE COPIES, - - - - - - -	10 CENTS

ADVERTISING RATES:

As ELECTRICITY reaches all classes interested in electrical work, its value as an advertising medium can be readily appreciated. Rates will be sent on application.

Changes for advertisements should reach the office not later than the Saturday preceding the date of publication.

ENTERED AT THE N. Y. POST OFFICE AS MAIL MATTER OF THE SECOND-CLASS.

TRADE SUPPLIED BY

EDITORIAL NOTES.

There are still left in this trade a large number of men who have entered into it for their life work. They may be disheartened, but they have not given up. It is for them that we write. To them we present our argument, and to them we must all look for the re-establishment of business principles, the reinforcement of the doctrines of common sense.

It is for these men to consider just why wrong has temporarily triumphed over right, why it was possible for the tricksters and adventurers to bring the industry to its present condition.

And when these questions receive careful thought the only answer possible is that the electrical press has not done its duty.

If the "Electrical Engineer," the "Electrical World," the "Electrical Review" and the "Western Electrician" had faithfully done their duty by the trade they claim to represent, whose best interests they claim to guard, the present situation would never have confronted us.—"ELECTRICITY," June 5, 1895.

The Edison Licensees. The meeting of the Association of Edison Illuminating Companies at Detroit last week was tame and uneventful. On Monday, the day before the Convention proper, Mr. Coffin met with the executive committee, Beggs, Gilbert and Weeks (Marks and Stetson being absent), and had a genuine love-feast. When Mr. Beggs presented his report the next day to the association he said everything was settled, that all was amicable, every promise asked for had been made, that the interests of the parent company and the licensees were identical, and they were now working in perfect harmony.

Of course this latter statement is true as far as Beggs and Coffin are concerned. They have always worked in perfect harmony, and it was well known last year, when Mr. Beggs made his strong speech in Boston and was then appointed chairman of the executive committee, that the association had been duped. Beggs was just as certainly working for Coffin in Boston as he was a year earlier, or as he was at Detroit last week. The only technical paper of particular interest on the programme was not read—that of Mr. Emmet on alternating current work.

The attendance was small—not over half that of last year, the delegates themselves numbering no more than the salaried representatives of the General Electric Company present.

The experienced observer of affairs can come to but one conclusion. The association is on its last legs. We mean no disrespect to that body in saying this, as we have always been sympathizers with them in their unfortunate position. They paid millions for a patent right monopoly in their respective territories and they have not been without competition for a single day. Now every patent which they bought is absolutely valueless. True they have had some benefits in the way of low prices on apparatus, but that does not help them now, when the average price on all apparatus is one-half or one-third of what they paid.

Every Edison licensee station in America would be at the mercy of a new company starting to-day which could parallel their lines, equal and extend their service, with 40 per cent. of the investment.

No wonder that over one-half the licensees failed to waste car fare to attend this meeting. The General Electric Company no longer has the power to do them any good. Organization is futile.

While the larger stations, like Chicago, New York, Philadelphia, Boston and Brooklyn, may continue to send men once a year to hobnob with the General Electric agents, the rank and file will never return. They will not even pay their dues. They know that in every controversy the association has been beaten. They think, with some reason, that the affairs of the association have not been properly looked after. They can see that the interests of the parent company do not conflict seriously with those of the managers of the large stations mentioned, and that such men as Insull, Edgar, Marks, Beggs, and Gilbert, representing these large stations, are more likely to look out for No. 1. than to pay much attention to the interests of the stations in smaller towns—in other words the stations which care nothing about the Edison underground system.

The entire situation, broadly considered, only emphasizes the unprecedented mismanagement of the electric lighting business, and the manner in which bankers and speculators have bedeviled what should have been the grandest industry of the latter half of the 19th century.

* * *

A Great Engineering Feat. It is a popular way of stating a thing "largely" to say "it beats the world," and it has come to have an accepted meaning. But how shall we express ourselves when it is the World itself that is the hero of the feats that we would sing in song? To use a much quoted expression, "Echo answers, 'how?'" Well, the *Electrical World* is the hero whose trilbys we advert to now. Like the heroine of Du Maurier's great story, the *Electrical World* got there last week with both feet.

Here's one of them. In speaking of Mr. Pope's recent Institute paper on the reconstruction of an old electric lighting plant, and incidentally of the Pomona 10,000-volt transmission, it says editorially: "As a voltage of 10,000 has proved to be entirely practicable, a territory within a circle of 100 miles diameter can be as easily served from a central point as can one town from its own plant employing the usual voltage." Now that settles a much mooted question, and we are glad to have it settled. It is now decided by the wisdom of our contemporary that because an electric light transmission scheme has been extended to a distance of 28¾ miles, or in other words, because the use of 10,000 volts has been found practicable, therefore a circle having a diameter of 100 miles can be as easily served from a central point as can one town from its own plant.

This stated in the language of Euclid would be "The whole is not greater than any of its parts," but it must be remembered that the *Electrical World's* geometry is not Euclidian, for some months ago that oracle enunciated the fundamental proposition (to which this latter one is but a corollary) that "if our system of units were based on π, then the ratio of the circumference to the diameter of a circle would be unity."

Commenting upon this at a subsequent date, we gave as our conclusion that if this proposition were true then the circumference of a circle would be measured in square feet, its area in cubic feet, the area of a sphere in cubic feet and its volume in units of the fourth dimension. The diameter would also have to be expressed in terms of the circumference, viz., in square feet; so that if we had a wire extending from the center of this 100-mile diameter circle it would be 50 square miles long and the volume of the copper would be 50 miles to the fourth dimension and its cross section expressed in cubic mils.

Now according to the theory of the fourth dimensionists this additional dimension should enable us to put a large body inside of a smaller one, and to see from a single point of view all sides of a solid sphere (including the inside). Most of us do not carry this fourth dimension around with us in our vest pockets, so that there are several things which we cannot see or do. The *Electrical World*, however, breakfasts on π and carries the missing dimension in its hip pocket. It is therefore enabled to see clearly from a point of view in which we are blind. It readily sees how, since "a voltage of 10,000 has been proved to be entirely practicable, a territory within a circle of 100 miles diameter can be as easily served from a central point as can one town from its own plant."

This is one foot. The other, although not a mate, is "like unto the first."

On the next page, in describing the new system of canal-boat traction proposed by Frank W. Hawley, the *Electrical World* says: "In the car or traveler there will be a shaft, around which the *tower* (sic) will make three turns."

We suppose the word *tower* refers to the cable by which the canal-boat is towed and not to the small car which does the towing nor to the supporting tower by which the cables are held aloft. Our reason for discarding the second interpretation is the same that led Lord Dundreary to discard the idea that the expression "birds of a feather flock together" referred to a lot of birds having only one feather between them—it was absurd. We also think it is absurd to assume that the boats will be towed by the traveler or car turning around its shaft three times.

The only alternative left us is to suppose that the towing cable turns three times around the motor shaft and winds in one direction or the other as the motor goes forward or backward.

But assuming this to be the correct interpretation, will the *Electrical World* please tell us how they are going to keep the cable on the shaft? The latter must needs be of indefinite length else the cable will wind off the end. But a happy thought strikes us. We remember having heard of a Yankee invention which may possibly suggest a method. According to the story, owls have to crowd the chickens off the roost before they can catch them in their talons and fly off with them. All roosts are necessarily limited in length, so that no matter how long they are the owl can crowd the hen off the end if he only persevere. The Yankee solved the question by making the roost in the form of a closed circle (not the one with the peculiar relationship between circumference and diameter, but only just an everyday circle). The device was tried, and that night the inventor on going out to the henhouse found all the hens moving round and round on the roost, keeping rythmic side-step with the owl who was beginning to look discouraged.

We suppose the shaft upon which three bights of the towing cable are taken is a circular one and the cable as it winds or unwinds moves round and round as did the owl and the fowl.

Under the Searchlight.

Views and Opinions on Timely Topics.

THE PASSING OF THE BAD MAN.

The observant Western tourist of 1895, if he revisits the sections of the country which once had such a reputation for toughness, cannot fail to notice that the Bad Man is rapidly becoming extinct. The forces of civilization have become too strong for him. He no longer finds glory in terrorizing the community. When he talks too much he gets his face slapped, and if he pulls his gun or his knife nowadays he usually gets knocked down and then locked up. All this has been very discouraging to the men of the type of the Tearing Terror of Taos, and his species get rarer and rarer each year.

So it is in the electrical business. The Bad Man has had his day in robbery and bribery, and a good many of him are now getting their day in court according to the fundamental principle of English law.

For quite a period he was conspicuous; he accepted bribes openly, or gave them, as the case might be. He bought councils, purchasing agents, etc., with impunity. He took contracts away from legitimate competitors by the dozen score. He got to be a big man in his way. He wore diamonds, spent money freely, built rows of houses, gambled in stocks,—and the founder of the Bad Man school became president of the largest electrical corporation in the country.

But now all is changed. People no longer regard the Bad Man with feelings of admiration. His calling is gone, and grand juries and courts are wont to look upon him the same as upon any other criminal. He was all the time either a thief or a breeder of thieves, and it has taken but few years to end his career.

These remarks are called forth by two recent events—one the indictment of Maurice Hart at New Orleans, for perjury in connection with franchise matters; the other, the ousting of L. H. McIntire from his position with the People's Traction Company in Philadelphia, accompanied by suits brought by the company to recover various commissions paid to McIntire by different manufacturing companies—first of all, the General Electric Company.

A good many facts in regard to this latter matter are yet concealed, but a few of them are on record in the archives of ELECTRICITY. When Mr. McIntire took his position as general manager, chief engineer and electrician of the Philadelphia company, he had already been with the Thomson-Houston Company, and had seen the workings of the science of "addition, subtraction and silence" as practised by his superiors from C. A. Coffin down. Almost the first purchases which were made in Philadelphia under his advice brought a test of his honesty which he could not stand. He accepted an honorarium for purchasing just what he would have bought in any event. From that time on his development as a striker was rapid. He learned a quick way to riches, and nearly every concern which expected to sell anything to that system had to pay a commission. Two exceptions are known to us. That of the J. G. Brill Company and that of Siemens & Halske. John Brill went before the directors of the company, protested, and refused to be blackmailed. At the directors' meeting referred to, when Mr. Brill protested against what may be called the "McIntire idea" of buying goods, Mr. McIntire got up before the board of directors of his own company, and stated that the J. G. Brill Company did not know how to build a good street-car or a good street-car truck, and Mr. Brill showed the board of directors conclusively what was the governing reason for Mr. McIntire's opinion. And on the Siemens & Halske generators hangs a story. They were the innocent immediate cause of the present trouble. When Mr. McIntire was away on his vacation, Mr. Shelmerdine, the president of the road, decided to make certain purchases. When McIntire returned he found that his victims had been frozen out, and therefore he had lost a chance to make money. He blamed E. D. Mullen, Philadelphia agent of the General Electric Company, for the occurrence. So when it came to the purchase of generators he swung the trade to Siemens & Halske, simply for spite, though of course the company got good value for their investment, and no commission was paid.

Then Mr. Mullen seems to have retaliated, and turned over to the company certain vouchers for large sums paid to McIntire previously as commissions. Most of the sales of the General Electric apparatus to the People's Traction Company were made through Capt. Eugene Griffin, O. T. Crosby and E. D. Mullen.

Two weeks ago Mr. McIntire had a secret meeting in Cleveland with General Electric officials. Mr. C. A. Coffin was in Cleveland about that time.

We cannot predict just who will be hurt the most in the disclosures to follow, and do not care to. The trade will be purified by it all, and we do not see how McIntire can be sent to prison unless those who paid him the money go too.

The briber is as bad as the man who accepts the bribe.

In the New Orleans case there are nine indictments against Hart, as follows:

A SYNOPSIS OF THE SPECIFICATIONS.

Indictment No. 1, for Perjury—That Maurice Hart falsely swore before the grand jury on July 26, 1895, that Bier had asked for four notes of $25,000 each, as an accommodation, so as to use the collaterals attached thereto, when, in truth and in fact, Hart well knew that the notes were paid over to Bier for the purpose of hiding from the public and the grand jury the fact that the profit of $100,000 derived by Bier from the sale of the franchises of the New Orleans City and Lake Railroad Company had been paid to Maurice J. Hart.

Indictment No. 2, for Perjury—That on July 31, 1895, Maurice J. Hart falsely swore before the grand jury that a check for $7,483.33 had been paid to Bier as interest on notes, when, in truth and in fact, the money was paid to Bier for the purpose of defraying the whole or part of the expenses incurred by Bier in his trial for perjury.

Indictment No. 3, for Perjury—That on the 26th of July, 1895, Hart swore before the grand jury that he did not have in his possession Bier's ledger, when, in truth and in fact, he had possession and control of the book.

Indictment No. 4, for Perjury—That on the 8th of August, 1895, Maurice Hart falsely swore before the grand jury that a certain note for $25,000 had not been extended, when, in truth and in fact, he well knew that the note was extended sixty days from August 22, 1894, and that interest on the same was paid.

Indictment No. 5, for Perjury—That Maurice J. Hart on the 26th of July, 1893, falsely swore before the grand jury that Bier had made the purchase of the franchises on his own account, and that the loan to Bier of $50,000 by the Louisiana National Bank was not on securities furnished by Hart, when in truth and in fact, Hart well knew that Bier was acting as agent of the traction company and of Hart in purchasing the extended franchises; and that Hart also knew that if the traction company had not taken the franchises off Bier's hands Bier would not have been obliged to keep them.

Indictment No. 6, for Subornation of Perjury—That Hart instigated and suborned Bier to testify as he did in the suit of S. D. Peters et al. vs. the city of New Orleans, in the Civil District Court, which false testimony caused the indictment, trial and conviction of Bier for perjury.

Indictment No. 7, for Obtaining Money by False Pretences—That on November 22, 1893, Hart obtained feloniously and by conspiracy, through Henry Bier, from the traction company the sum of $100,000, part of the $800,000 to be paid by the traction company for the transfer of the extension of the New Orleans City and Lake Railroad privileges, and that of the sum of $100,000 Bier only got $15.000 from Hart as his share.

Indictment No. 8, for Obtaining Money, etc.—That on the 12th of November, 1893, Hart caused to be delivered by the traction company to Bier, through fraud and collusion, $72,000 in face value of the first mortgage bonds of the Crescent City Railroad Company as the 10 per cent. commission claimed by Bier for his transfer of the franchises to the traction company for the sum of $800,000.

Indictment No. 9, for Obtaining Money, etc.—That on January 5, 1894, Maurice Hart obtained through Bier, by fraud, conspiracy and collusion, from the traction company the sum of $5,080.55, because Bier falsely represented that he had been the bona fide purchaser of the franchises, and that sum of $5,080.55 was obtained as part of the interest on the sum of $800,000, the purchase price from the traction company of the extended franchises of the New Orleans City and Lake Railroad Company.

Mr. Henry Bier, who is now under sentence for perjury in this same case, has confessed, and it is upon his evidence chiefly that Hart is indicted.

Mr. Hart has been known for years as a Bad Man in his particular line—that of owning councils.

New Orleans is thoroughly stirred up, and the fact that Hart is wealthy and powerful is more likely to injure his case than to benefit him.

With two such cases in one month is it any wonder that the electrical Bad Man feels discouraged?

* * *

The Cotton States and International Exposition.

"At high noon on September 18," says the Atlanta *Constitution*, "in the presence of many thousand visitors and distinguished guests, the electric current will come bounding fresh from the hand of President Cleveland, and with a roar and a rumble the wheels will begin to revolve, and the Cotton States and International Exposition will be in full blast. As the current reaches the Exposition grounds a thousand flags will float to the breeze, engines will blow a long-continued whistle, thousands will wave their handkerchiefs, and with shouts and cheers the curtain will go up and the show will be on."

President Cleveland informed the committee that he could not possibly be present in person at the opening, and they have decided to have wires arranged so that by touching a button at Gray Gables Mr. Cleveland will start the Exposition machinery in motion.

* * *

WILL IT DISPLACE THE DYNAMO?

A Great Discovery.

(From the N. Y. Telegram.)

A lamp that will burn for 600 hours is the invention of George L. Roberts, an electrician, who sold to a tobacco company, for $80,000, the advertising rights of some of his electrical devices. The lamp of which Mr. Roberts is the inventor is charged with sand, into which two wires are run, which connect with one of the regulation bulbs used on all electric chandeliers. The battery is therefore the sand, but the method of charging it remains a secret with Mr. Roberts. Mr. Edison, after seeing Mr. Roberts's lamp, remarked that he thought he knew all there was to know about electricity, but Mr. Roberts had made a discovery which puzzled him greatly. Mr. Roberts presented Mr. Edison with some of this remarkable sand, but with no fear of having his secret discovered, for analysis happens in this case to kill all traces of the secret discovery.

Mr. Roberts made his discovery in Minneapolis in a purely accidental way. He was experimenting with acids in his laboratory and on the table was some sand over which two wires had fallen and crossed themselves. By an accident a bottle containing a certain acid was overturned and some of the acid ran into the sand at the point where the wires crossed. The result was a series of electric sparks.

At present Mr. Roberts is quite a sick man and is in Michigan for his health. Another of his inventions is to make seventy-two changes of color, in the hair, dress, tights, shoes, etc., of a dancer while she is in motion. The mechanism works by clockwork and the light gleams through the fabrics from a direct current. Mr. Roberts married a daughter of Pillsbury, the great Minneapolis miller.

We do not wonder much that Mr. Roberts is sick. He deserves to be, and we hope he will never get well enough to stuff another guileless reporter.

EDISON ILLUMINATING COMPANIES.

Proceedings of the Meeting at Detroit.

The Sixteenth Convention of the Association of Edison Illuminating Companies was held in Detroit August 13, 14 and 15.

The first session of the Convention was called to order August 13, at 10 A. M., by C. L. Edgar, president. The roll was called. Those present were:

J. W. Lieb, Jr., Asst. Gen. Mgr. Edison Ill. Co., New York.
W. S. Thompson, Inspector Detroit Edison Co., Detroit, Mich.
John I. Beggs, Vice-Pres. and Gen. Mgr. Cincinnati Edison Elect. Co.
Geo. A. Redman, Gen. Supt. Rochester Gas and Electric Co., Rochester.
Adolph Muller, Hagen, Germany.
A. M. Clark, Meter Dept., Detroit Edison Co.
W. S. Barstow, Gen. Supt. Edison Elect. Ill. Co., Brooklyn, N. Y.
Geo. Wiley, Detroit Edison Co.
Daniel McCoy, Pres. Edison Light Co., Grand Rapids, Mich.
Geo. W. Cato, Electrician Detroit Edison Co.
A. F. Walker, Supt. Edison Electric Co., Grand Rapids, Mich.
Sam'l Scovil, Vice-Pres. Cleveland Elect. Ill. Co., Cleveland, O.
Winfield S. Jewell, Gen. Mgr. Toledo Electric Co.
Geo. Peck, Pres. Detroit Edison Co.
Hoyt Post, Attorney Detroit Co.
C. L. Edgar, Vice-Pres. and Gen. Mgr. Edison Ill. Co., Boston.
Arthur Williams, Gen. Inspector Edison Elect. Ill. Co., New York.
B. E. Sunny, Gen. Electric Co., Chicago, Ill.
J. R. Lovejoy, Gen. Electric Co., Schenectady, N. Y.
Luther Stieringer, New York.
Robt. Lindsay, Gen. Supt. Cleveland Elect. Ill. Co.
S. D. Greene, Gen. Mgr. Light Dept. General Electric Co,
H. T. Edgar, Gen. Mgr. Edison Ill. Co., Atlanta, Ga.
A. D. Page, General Electric Co.
C. P. Gilbert, Gen. Mgr. Detroit Edison Co.
Caryl D. Haskins, Meter Dept. General Electric Co.
J. S. Crider, Edison Electric Ill. Co., Cumberland, Md.
Sam'l Insull, Pres. Chicago Edison Co., Chicago, Ill.
F. Sargent, Consulting Eng. Chicago Edison Co.
W. S. Andrews, General Electric Co.
M. A. Beal, Sec. and Treas. Forest Elect. Light and Power Co., Rockford.
Edwin R. Weeks, Gen. Mgr. Edison Elect. Light and Power Co., Kansas City.
Chas. R. Price, Treas. New Bedford Gas and Elect. Lt. Co.
A. W. Field, Sec. and Mgr. Columbus Edison Elect. Lt. Co.
Geo. R. Stetson, Pres. New Bedford Gas and Elect. Lt. Co.

After the roll-call the executive committee, represented by its chairman, Mr. John I. Beggs, made a report recommending the acceptance of the application of three companies for admission, viz., The Edison Light and Power Company, Pottsville, Pa.; the Toledo Electric Company, Toledo, O., and the Sault Ste. Marie Company, Sault Ste. Marie. The companies were admitted.

A report by A. E. Kennelly (for Committee on Lightning Protection, Grounding the Neutral in Three-wire Systems, Crosses with High Tension Systems) was submitted, accepted and committee discharged.

Addresses were then made by S. D. Greene of the General Electric Company, Mr. Insull of Chicago and Mr. Beggs of Cincinnati, on "The Relations of the General Electric Company to Edison Licensee Companies."

After considerable discussion, W. L. R. Emmet, of the General Electric Company, was called upon for a paper entitled "Some Comparison Between the Direct Current Low Tension System and the Alternating Current Multiphase System for Central Station Lighting." Mr. Emmet was unavoidably absent and his paper was ordered printed in the minutes. The session then adjourned.

The second session was held at 2 P. M. and the Storage Battery Committee made its report. Discussion followed. Mr. Muller of Hagen, Germany; C. L. Edgar and J. W. Lieb, Jr., gave their experiences. A paper by Messrs. Pierce and Hale was then read by C. L. Edgar of Boston. The title of the paper was "Energy Losses in the Boston Edison Stations." After discussion on this paper, the session adjourned.

The evening was given up to a car ride and visit to "Lallah Rookh" (by courtesy of the Detroit Edison Company).

SECOND DAY.

The third session was called to order at 10 A. M. August 14. A paper by W. S. Barstow on "Method of Charging for Current for Incandescent Lamps and Motors" provoked much discussion, and with Arthur Williams's paper, "Relation of Company to Customer," occupied the entire morning. The session adjourned at 1 P. M.

The fourth session opened with a discussion by Mr. Beggs, Mr. Greene and Mr. Howell on Incandescent Lamps, Welsbach Light and Acetylene Gas.

A paper by C. D. Haskins on "Facts in Relation to Mechanical Recording and Chemical Meters" was then read and discussion followed.

The evening was taken up by a drive and lunch on Belle Isle (by courtesy of Detroit Edison Company and General Electric Company).

THIRD DAY.

In accordance with past custom, the last day of the Convention, August 15, was given to entertainments. This took the form of a delightful sail along the river at the invitation of the Detroit Edison Company, who, together with the General Electric Company, received the thanks of the Convention for their past courtesies.

NOTES.

Among those present beside the delegates and representatives of the General Electric Company were Messrs. E. W. Little, of the Interior Conduit and Insulation Company; George McKinlock, of the Central Electric Company; P. H. Alexander, Electric Selector and Signal Company; B. F. Miles, National Carbon Company; John Crider, Washington Carbon Company; Bailey Whipple, Manhattan Electrical Company and representatives of ELECTRICITY, the *Electrical World* and *Electrical Engineer*.

Mr. Edison sent regrets for his inability to attend as he was unable to leave his mining interests at Edison, N. J.

The General Electric Company presented each member of the association with a handsome badge, representing the fields of a multipolar generator, from the center of which hung a miniature incandescent lamp. The title of the association, the place of meeting and the date were neatly arranged around the field.

The next Convention will be held in, or in the vicinity of Brooklyn, commencing the second Tuesday in August, 1896, and continuing three days.

American Electrical Works' Clambake.

The seventeenth annual gathering of the electrical fraternity for the purpose of eating clams as the guests of the American Electrical Works, Providence, R. I., took place on Saturday last at the beautiful grounds of the Union Club. There were nearly 200 guests present, every one of whom thoroughly enjoyed the day and were delighted with the clambake and the subsequent proceedings.

GENERAL ELECTRIC'S FINANCING POLICY.

Northwest General Electric—The Scheme, the Companies Financed, the Facts and Figures from the Official Record.

HOW BONDS ARE MANUFACTURED FOR NEW ENGLAND INVESTORS.

CHAPTER VI.

Our Principles, Our Policy and the Justness of and Necessity for this Campaign.

The article in last week's issue on the Tacoma Railway property forms a temporary resting point in the discussion of the electric railway swindles in the Northwest, and we shall, for the present, suspend the further consideration and presentation of facts concerning the financing of various other properties of the same class and character in that territory, pending the compilation of an elaborate table of data, bearing directly upon those properties and similar ones. In the meantime we shall next week begin the publication of a series of articles on some of the electric lighting schemes and swindles founded upon them in the same territory, and shall show that in the lighting branch of the business the same methods were pursued and similar schemes were resorted to for fleecing the public as were used in connection with the financing of the railway properties, (already treated in the preceding articles under this title,) whenever the managers of the Thomson-Houston Electric Company's or later the General Electric Company's interests in that section found an opportunity, or could, by hook or by crook, devise one to suit the purpose and meet the requirements of their nefarious plans.

In the near future, however, we shall resume the discussion on the methods and results of financing other railway properties in that section of the country, and shall extend the scope of the inquiry and discussion so as to include all sections of the United States; and we shall clearly demonstrate that the scheme of operation carried on in the Northwest was not *peculiar* to that section of the country, but was in fact the scheme always resorted to whenever the managers of the Thomson-Houston Electric Company, or later the General Electric Company, had the power to manipulate the properties to suit their purposes, whether these properties were located in the Western, Eastern, Northern, or Southern section of the country.

In this broader and more fertile field we shall present absolute facts which will prove beyond the suggestion of a doubt that there was one master mind which originated this scheme of operation, and organized, directed and absolutely controlled the forces engaged in carrying it into effect. After the presentation of such facts as are now in our possession concerning the plan of the scheme and the general methods employed in its realization, and the results arising from its widespread application, we venture to express the opinion that no one will fail to clearly perceive who was its originator and director; and we venture the further opinion that no attempt to shirk the responsibility for its conception and reduction to practice, and no endeavor to transfer the burden of ignominy and disgrace, justly resting on the shoulders of one guilty person, to the shoulders of the but little less guilty lieutenants or underlings, who were the well paid tools under the control and direction of the master mind, or to the shoulders of the large force of carefully coached and unprincipled accomplices, will be of the slightest avail.

The information we shall give will incontrovertibly prove that in its conception, conduct and widespread extent; in its injury to and destructiveness of legitimate business and worthy enterprises, and in the number and wide distribution of persons affected and victimized by it, this vast, fraudulent electric scheme has never been equalled in this or any other country. When all its revolting details are seen; when the facts and figures clearly demonstrating its magnitude are brought out; when a complete view is obtained of all the devious, unscrupulous, and in many ways thoroughly dishonest methods by which the scheme has been worked for the nefarious purposes of those who expected to reap most from it, we think it will be frankly admitted to be a national calamity, and we are sure that all reputable persons will join with us in the sincere desire to see the industry purged of all those who have been responsible for the inauguration of this scheme of financing, assisted in bringing it about, or contributed in any way to its continuance.

Of one thing we are absolutely certain, namely, that all the numerous fraudulent schemes and fakes having for their foundation the applications of electricity, and foisted upon the public by some of the various parent companies in the field, will, sooner or later, clearly stand out before the eyes of the public, and will form an everlasting monument to perpetuate the memory of the rascality of their managers—a type and degree of rascality we believe and know to be unique, marvelous and absolutely incomparable in its barefaced effrontery and brazenness.

In its magnitude, and the broadness of its field of operation, this electric fraud vastly transcends the many fraudulent schemes which have characterized and disgraced the latter part of this century.

For magnitude, and for the baseness of the methods employed in its conduct, it casts into the shade the worst schemes engendered in the fertile and ingenious minds of those acknowledged princes of fraud, Jim Fisk and Jay Gould, whose doings still rankle in the breasts of all honest Americans and cause them to bow their heads whenever the frauds they perpetrated upon the investing public in this and other countries are brought to mind.

The peculiar plan of financing developed and carried into effect in the electrical business of this country constitutes another blot upon the escutcheon of American honor; and when its nature and extent are fully realized by the public, it is sure to cause a feeling of the most intense disgust in the minds of all who are jealous of the honor and good reputation of its citizens and the general welfare and prosperity of the nation. Of itself it constitutes just and sufficient cause for the sturdy founders of the republic to rise in their graves and invoke the curses of heaven upon the heads of that class of financiers and manipulators who hesitate not at the employment of any means, no matter how base, nor have the least scruple against the violation of any law in devising cunning and nefarious schemes designed to extract from the pockets of their fellow-beings their hard earned savings without equivalent return.

Such schemers and manipulators are the most dangerous enemies of their country. They are the destroyers of its credit and of the good name of its citizens, and their actions bring disgrace upon the entire nation. They are undermining the foundations of law, order and liberty, upon which the republic rests, and are making it more and more difficult, day by day, for all honest people in the land to earn their daily bread. They are the men most responsible for the scattering of the seeds of anarchy and socialism; and their doings are urging the people along paths which tend to upset the stability of our industries, our commerce and our finances.

They are the parasites of the human race; they feed upon its very life's blood, and paralyze the industries of the country in which they live. For do they not substitute for honest labor and honorable effort *mere schemes*, designed to richly line their own pockets and fill their own coffers to overflowing with the money rightfully belonging to others?

They are neither legitimate producers nor legitimate distributers of the products of others, nor do they usefully contribute in any way to the permanent establishment of the industries or commerce of the country. Whatever their hands touch is blasted by the fraudulent schemes ingeniously devised by them for fleecing their fellow-men; and by resorting to these schemes they reduce the power, ability and willingness of others who are in a position to assist in the establishment of industries, by destroying the confidence of the community in new enterprises, be they ever so worthy.

Such men are the bane of the human race; retarders of the development of its best interests; stumbling-blocks in the path of all earnest workers for the welfare of the nation. By the vast wealth, frequently acquired by many of them through the practice of their iniquitous methods, they set an example to the young men of this and other countries which is most deadly in its effects. For does not the vastness of their ill-gotten gains frequently stimulate others to follow the same course in life by the promise of speedy and rich reward for perfidy and baseness, and also induce the young men of this country to ridicule all honest work and honorable effort?

If anyone believes that an industry is benefited by the class of men who for years past have been largely instrumental in directing and controlling the electrical business of this country in the manner we have already clearly pointed out, that person is certainly mistaken.

Such methods as we have already proven to be in operation, and others of the same kind which we shall disclose later, must necessarily finally result in great injury to the business as a whole, and in suffering and final loss to everyone conscientiously and earnestly occupied in the development and conduct of any branch of it, and to any business allied to it or dependent upon it for any portion of its trade.

Permanence and continuous healthy growth of an industry are elements of more true value than that absolute uncertainty of continuance and that kind of growth invariably induced by stock-jobbery and fraud, no matter how great that growth may be.

Permanence and healthy growth should be, and always are, the objects sought to be attained by those having the best interests of an industry at heart. Neither can exist, however, in a business in which the moral sense of the workers in it is dulled, dwarfed, or wholly destroyed by the constant practice of chicanery, deception and absolute dishonesty—all three of these being the natural concomitants of stock-jobbery.

That *solid* success absolutely essential to the true welfare of all employed in an industry, and to its continuous prosperity, can only be secured by well-directed and sustained efforts on the part of all the persons engaged in it; and such success can then only be reached and the prosperity be maintained by seeing to it that those in charge of all departments of the industry have properly trained minds well fitted to cope with and successfully overcome the difficulties encountered in the establishment of it.

There is nothing more unfortunate than for a company engaged in the development of an industry to have as its principal or executive officer a man deficient in strict business morality, or one who will wink at or encourage others to depart from strict business rectitude. A company with such an executive officer must expect its entire staff of employees to soon become permeated with the same spirit, and it will not be long before even its own interests will not be safe in their hands. To wink at or encourage the practice of fraud on outsiders is to, sooner or later, *insure* its practice upon ourselves.

Honest, earnest, able workers are the men to be sought for to fill the positions of trust in an industrial enterprise. Such men seek to secure substantial and legitimate returns on the capital invested in it—to obtain *results.* Stock-jobbers and financial-jugglers care more for something that will temporarily startle and impress the public mind and ensnare their intended victims. This latter class of men labor for temporary *effects*—sensational effects, in contradistinction to permanent substantial *results.* Permanence and soundness of a business are of no importance to their schemes, and in fact are seldom or never taken into consideration by them. Moreover, they frequently ruin what would be, under skilful and intelligent management, a really profitable business.

Even where a business has for its foundation a perfectly sound and trustworthy basis, such a class of men as have largely directed and controlled the commercial part of the electrical business of this country for years past will undermine its foundation and bring it to ruin and into utter disrepute. For lacking that actual and intimate knowledge of its details, and that full knowledge of the principles upon which the art is founded, and being destitute of the skill and ignorant of the care needed to foster it and conduct it through the dangerous periods of its numerous trials and lead it to final success, they substitute for these essential requisites of success a low order of cunning and the worst species of knavery, which necessarily results in the establishment of a policy diametrically opposed to all good and trustworthy business principles, and which will ultimately and inevitably destroy every chance of legitimate profit being derived from it. Can any one doubt that this policy has almost constantly been pursued in the electrical business after our exposures? Does any one suppose that the same methods are not in full operation to-day? If so, we will shortly furnish the means for every one in the business to decide that question for himself.

Dishonesty in any industry is not beneficial to that industry and never can be. In fact it is subversive of the best interests of all engaged in any industrial enterprise in the conduct of which it constitutes an element. It is never resorted to, and never need be, by any sane person justly entitled to enter and occupy any position in any industrial enterprise, and who is also fully competent to understand and deal intelligently with the problems met with in carrying it on. On the other hand, it is almost invariably resorted to by those persons ignorant of the details of the business in which they engage and incapable of understanding its principles, and therefore wholly incompetent to properly and successfully conduct it. With this latter class of people, dishonesty and power of misrepresentation frequently constitute their principal means of doing business, and upon them they mainly rely to hold the positions they are really incompetent to fill with honor and credit to themselves or with any advantage to the interests they are supposed to guard and serve.

There has never been a time in the electrical industry when the services of such people were necessary, and at no time in its history has it been so evident that they have been the worst stumbling-blocks in the way of its successful prosecution, and the worst enemies it has had to encounter. The fatal effects of their vicious policy is becoming clearer every day, and if anything of much value is to be left of the business, they and their methods must soon be stamped out of existence.

We hereby give them fair notice of the warfare we shall wage upon them, until they are all forever driven from this field, which their operations have made too unsafe for the investment of capital, too unsavory for the endurance of all honest workers, and too dangerous for the best men in the trade to encounter.

Let all those legitimately engaged in any branch of the business, or dependent upon it for support, unite in an earnest effort to stamp out these men, and assist in banishing from the business such methods as have been resorted to by them, so as to save the industry from the further imminent and serious dangers threatening it, and that *before* the confidence of the public in electrical enterprises is totally destroyed. The already too manifest dire results to the business directly traceable to and caused solely by the methods pursued by the gang of schemers and financial-jugglers with which the business is infested, has greatly injured the whole enterprise; and so long as these men materially influence, or sensibly determine its future course, the business can never reach that degree of stability which inspires the confidence of capital, induces and insures honest work, and leads to final success in all those branches where success is possible.

Our battle cry is: Away with all who have resorted to, connived at, or assisted in the iniquitous methods which have disgraced and grossly injured this industry, and with all elements which tend to the further instigation, fostering and perpetuation of such methods!

Hear, O hear, all ye tricksters, adventurers, financial-jugglers, fraudulent-bond-manufacturers and manipulators, stock-jobbing swindlers, company-robbers and wreckers, debauchers of our patent system, now and for some time past largely engaged in the electrical field; and know ye that in ELECTRICITY *there exists indeed a* SUBTLE FORCE, *ever at work, which will eventually illumine with a glare equal to the brightest sunlight, and penetrate and dissipate the darkness with which you have surrounded your unscrupulous schemes, and will rend, with the relentless and irresistible power of that force, the structures of fraud you have erected in your disreputable careers.*

An Electric Hydraulic Shop Crane.

An unusual form of overhead traveling crane has been built by the Morgan Engineering Company, Alliance, O., to serve an open-hearth steel furnace in the Steelton Works of the Pennsylvania Steel Company. The main traveling girders have a span of 62½ feet, and the whole weight is about 113 tons. The trucks are mounted on horizontal pivots, with the wheels automatically adjustable to track irregularities, and driven by an independent electric motor. Another motor traverses the trolley, and a third independent one of 80 horse power drives a pair of 7x18-inch compound duplex pumps at a pressure of 700 pounds, actuated through 8-foot gear wheels. The main lifting cylinder is operated directly by the pumps, and has the load attached to the bottom of its piston rod. It is mounted so as to oscillate in all directions without danger of rotation about its own center, and is 21 inches inside diameter, with a stroke of 17 feet 6 inches.

BOOK REVIEWS.

The Elementary Principles of Mechanics. Vol. I, Kinematics (8vo, 225 pp.; price $3.50); Vol. II, Statics (8vo, 386 pp.; price $4.00). By A. Jay Du Bois, C. E., Ph. D., Professor of Civil Engineering in the Sheffield Scientific School of Yale University. New York: John Wiley & Sons.

These two volumes are an attempt to cover in a complete form the theoretical discussion of mechanical principles in a way to meet the wants of what may be termed first, second and third year students, the three collateral courses being distinguished as follows: the abridged course by large type, which is extended for more advanced pupils by copious additions in small type, and the advanced course, including applications of the calculus, which latter are enclosed in brackets. The method of treatment is that of precept and example, the text of each chapter being accompanied by illustrative numerical applications of the principles involved worked out in some cases with sufficient detail to enable the student to solve other examples which follow and to which the answers only are given. This plan is one that we have always commended in text books, as it constitutes a self help which no devotion of the teacher can adequately supplant.

The matter is exceedingly condensed both typographically and in methods of expression, and perhaps open to the criticism of being too much so. However, in so far as this is done without sacrifice of perspicuity it is an admirable feature, and we find that the author has generally succeeded.

We regard it as questionable if the attempt to combine three courses in one, as is done in this treatise, can ever produce as good results in any of the courses as can be attained when each is considered separately. The language and fullness which is adequate to the beginner is sure to be redundant for the more advanced student, and a compromise is disastrous to the former without presenting compensating advantages to the latter. This is our severest criticism of the treatise under review, that while it is excellent in its way the subject might have been handled to better advantage for the several grades of students for which it is intended had it been handled separately for each, having in view in each case the special requirements of the case.

Royal Handbook of Popular Science. By John Gall. 12mo, 196 pp., illustrated. New York: Thomas Nelson & Sons.

This little work is gotten up in dictionary form and is intended to serve as a handy work of reference for those who do not care to refer to more encyclopedic treatises. The scope of the book is confined to the physical sciences, with the exception of a few references to the more important topics of hygiene; and although with these limitations its size renders it necessarily very incomplete, the selection of terms to be defined has been done with good judgment and the definitions are clear, terse and reliable. The illustrations, of which there are many, are generally very well executed and judiciously chosen, and the book is altogether the best of its kind that we have seen.

In the House of Representatives at Washington, wires have been run to each desk from waiting rooms adjoining the Chamber where the pages will be hereafter obliged to remain until they are summoned. A push button connecting with the wire is affixed to every desk, and when a member requires the services of a page all he has to do is to touch the button; the attendant knows just where to go as the number of the desk is exposed in the waiting room when the button is touched. The old system is still retained in the Senate, the conservative Senators not being so quick to introduce innovations as the popular branch. Perhaps they do not wish to deprive themselves or their auditors in the galleries of the picturesque effect produced by the presence among them of the sprightly pages.

LONG DISTANCE TRANSMISSION AT 10,000 VOLTS*—IV.

(The Pomona Plant.)

BY GEORGE HERBERT WINSLOW.

(*Concluded.*)

A very good example of Prof. Fleming's "condenser effect" was met with in the summer of 1893, while the engineer was trying this converter test for measuring line leakage. The primary of a 1,000—100 volt converter was connected between the ground and one terminal of the generator, the other terminal of the latter being connected to one wire of the Pomona circuit. The resulting secondary pressure was 80 volts, which made one lamp burn dimly. When ten lamps were turned on, the pressure dropped to 14 volts. When all lamps were turned off the pressure became ten times as great, or 140 volts. One generator brush was then raised, and the second wire of the circuit was connected to the first. On completing the circuit again there was a sudden flash on the armature, followed by a crackling noise and a brush discharge which lasted until the circuit was broken. The Pomona wires were then disconnected from the dynamo terminal, which was left free. With this arrangement faint sparks and a glow were noticed, as though the armature winding were grounded on the core, but a Wheatstone bridge test showed an insulation resistance of over 10 megohms. Since then the machine has been used regularly and has not broken down, so it is evident the spark must have resulted from a sudden increase of the potential of the armature winding above that of its core, which latter was permanently connected to earth.

This sudden increase may be explained as follows: On closing the circuit the condenser formed by the line and the earth began to discharge through the metallic circuit afforded by the armature and converter windings, but the self-induction of this circuit checked the discharge so quickly as to produce an excessive pressure which could only be relieved by the discharge taking place through the insulation of the armature-winding to the grounded core, which is what happened.

A similar test was made on the San Bernardino wires in the previous January during dry weather, the only change being that the single lamp was not turned off. With only one wire connected, one 16 c. p. lamp came nearly to candle power. On connecting the second wire to the first (at San Bernardino) the lamp burned at full candle power. Ten lamps (the full load) were then put on the converter and burned dimly. As they were turned off one by one, the others brightened until the last lamp lighted up as before. This test did not cause any discharge on the armature, in spite of the fact that the circuit was twice as long and the capacity thus twice as great. The probable explanation of this is that the inductive resistance of the converter was not so great as in the other case, on account of the single lamp being left burning. It is also possible that the breakdown in the other test was assisted by the presence of copper dust on the winding.

A comparison of the San Bernardino switchboard voltmeter was made with a Weston instrument and gave important results.

1st. With *no load* the San Bernardino instrument was about 14 volts (11.2 per cent.) low at 125 volts, while at 97 volts it was only 11.7 volts (12 per cent.) low.

2d. With a *city load* (inductive, consisting of lightly loaded converters,) of 7½ amperes it was 11 volts low between 107 and 96 volts, while for 15 amperes it was only 8.5 volts low. Further increase in load caused further reduction in the difference, until for 40 amperes the instrument was only 5 volts low.

3d. With a *tank load* (non-inductive) of 9 amperes it was only 9 volts low at 99 volts, and as the load was increased the difference decreased until for 97 amperes the instrument read the same as the Weston.

It is evident from these observations that a voltmeter which consists essentially of a solenoid and a movable core is not the proper type of instrument for circuits such as those used in the present case, in which transmission circuits of great lengths are used in conjunction with transformers. The voltage at San Bernardino during the tests was therefore measured with a Weston portable voltmeter.

A comparison between the ammeters used at Pomona and San Bernardino showed that for readings above 67½ amperes the San Bernardino instrument read higher than the other. As there was no reason for considering one instrument more accurate than the other and no way of telling which was right, the San Bernardino readings taken during the test were reduced to the average of simultaneous readings on the two instruments.

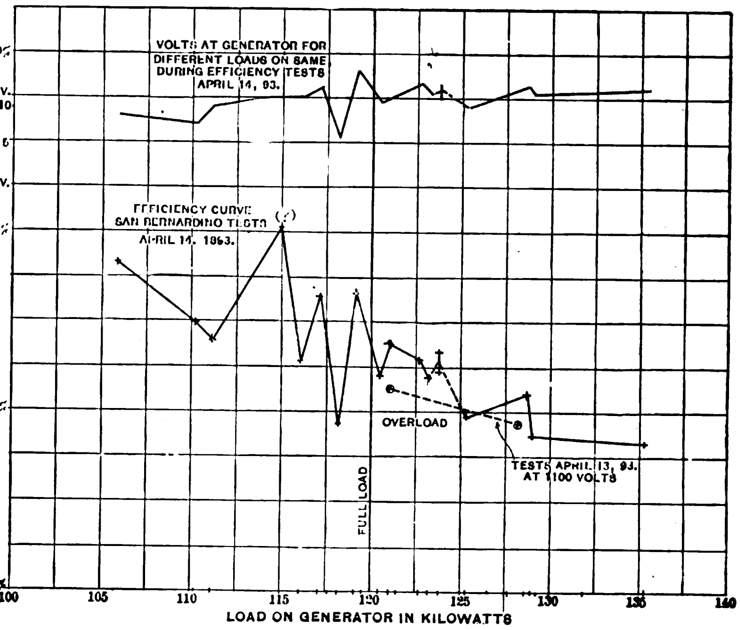

FIG. 7.

A short test of the Pomona circuit was made on April 11, the results of which are given in Table I.

A preliminary efficiency test on the San Bernardino circuit lasting five hours, during which the generator was kept at full load or overload, was made April 14, 1893. Readings were taken every fifteen minutes, and the efficiencies and the corresponding voltages for different loads are plotted in Fig. 7. The most prominent feature of this efficiency curve is its irregularity. This is, however, satisfactorily explained by referring to the curve of generator voltage, on which it is seen that the high efficiencies correspond to high voltages, and vice versa.

TABLE I.

EFFICIENCY TESTS. POMONA CIRCUIT.

April 11, 1893.

Canon (20 Converters).			Pomona (18 Converters).			
Amperes.	Volts.	K. W.	Amperes.	Volts.	K. W.	Efficiency per cent.
120	1100	132	105.85	919	97.28	73.7
118.5	1100	130.35	105.85	945	100.01	76.73
119.5	1100	131.45	107.4	929	99.78	75.9

It will be noted that the apparent efficiencies shown by the preliminary tests at San Bernardino agree very closely with the results of the long efficiency test there. On calculating the apparent efficiencies for different loads from data obtained by laboratory tests, and comparing them with the measured apparent efficiencies, it is found that they agree within 3 or 4 per cent. This very close agreement is exceedingly gratifying, particularly when we consider that the tests of the plant were made with ordinary commercial instruments, and that the laboratory tests were made about a year before the commercial tests.

TABLE II.

42½ MILE TRANSMISSION TEST. CIRCUIT TO SAN BERNARDINO, BY WAY OF POMONA, 85 MILES.

May 2, 1893.

Canon (20 Converters).			San Bernardino (18 Converters).			
Amperes.	Volts.	K. W.	Amperes.	Volts.	K. W.	Efficiency per cent.
95	1120	106.4	80.75	847	68.4	64.28
96	1130	108.5	78.8	865	68.16	62.82
100	1200	120.0	81..	893	72. 6	60.8

An interesting and unique test was made May 2, 1893, by connecting the Pomona line wires in series with the San Bernardino circuit, and transmitting about 100 H. P. to San Bernardino by way of Pomona. The length of the circuit was 85 miles, and the distance of transmission 42½ miles. This is the greatest distance yet covered by any transmission since the Frankfort experiments. The measurements are given in Table II. The apparent efficiencies are much lower than those indicated by calculations, as in the latter no account was taken of the capacity and inductance of the circuit. The voltage of the generator as measured is about 5 per cent. above that calculated, and the amperes measured notably exceed the amperes calculated. These results are attributable to the introduction of the Pomona loop, which added both capacity and inductance.

In order to reduce the cost of operation, the San Antonio Company first dispensed with the sub-station attendant at Pomona after 11 P. M. This they did some time before the acceptance of the plant, after assuming the responsibility for any damage which might result. No trouble occurred, and after the acceptance (May 6, 1893,) the same plan was put in operation at San Bernardino. After working in this way for several months, the Pomona station was started in the afternoon and then locked up until the next morning. This arrangement was made possible by running the generator so that the lights should not be too high at Pomona, the lights at San Bernardino being kept right by the attendant with the Stillwell regulator.

---

*A paper presented at the Twelfth General Meeting of the American Institute of Electrical Engineers, Niagara Falls, June 27, 1895.

In January, 1894, another 120 K. W. generator was installed with an equal capacity of oil transformers, and the Pomona and San Bernardino circuits are now each operated from separate generators with separate banks of transformers of 10,000 volts. Since this change the San Bernardino attendant has also been dispensed with, and the bookkeeper starts up in the afternoon and then locks up the station for the night, as at Pomona. The voltage of the lamps on each circuit is regulated by the engineer at the power house, the generator pressure necessary at different loads to keep the lamps at the proper brilliancy being automatically indicated by the compensating voltmeter on each circuit. Thus after the plant is started the engineer has sole charge.

CATAPHORESIS AND SOLUTIONS OF H_2O_2 FOR BLEACHING TEETH, ETC.*

BY WILLIAM J. MORTON, M. D.

By cataphoresis is meant the movement of fluids, together with the substances they may hold in solution, from the positive pole of electrodes conveying a continuous current in tissue, toward the negative pole. As signified by the derivation of the word "cataphoresis," the substance held in solution "goes down" with the current, that is to say, moves with its ordinarily accepted direction of flow, just as in electroplating the metal held in solution goes down, i. e., from a higher to a lower potential, and is deposited on the negative electrode or cathode. This comparison to what takes place in electroplating might lead us to believe that cataphoric action was due to electrolysis, and it must be admitted that electrolytic and cataphoric action are not yet differentiated with sufficient clearness. But there is little reason to doubt that one action is as distinctive a property of the continuous current as the other. And, without entering into the reasons for this statement, it is enough to affirm, for all practical purposes, that fluids in tissue do move from the positive to the negative electrode. But there are exceptions even to this statement, for eosin travels from negative to positive, as also does an alcoholic solution of bromide of barium.

So much, in a brief way, for cataphoresis—the general principle. Should we desire to make use of this principle to introduce medicines into human tissue, we may refer to the procedure as cataphoric medication. And to avoid confusion and theory, and the contradiction that some substances in solution travel upward rather than downward, I have proposed the terms electric diffusion and electric medicamental diffusion. These terms at least express the facts.

To secure successful electric medicamental diffusion, several important points may here be noted.

(*a*) The medicine in solution must be brought into intimate contact with the tissue in order to constitute with it a comparatively continuous electrolyte.

(*b*) Metallic conduction [of the electrode, the positive pole] must end very close to where electrolytic conduction begins; that is to say, the absorbent material holding the solution must be thin, and allow the metal electrode to come as near as possible to the tissue.

(*c*) The negative electrode must be removed to a distant point.

(*d*) If the tissue to be treated is the skin, it must be well washed with soap and water, or ether or alcohol, to remove the natural oils.

(*e*) The solution used must be of neither too high a resistance nor of too low. If too high, like alcohol, ether, or chloroform, no current will be conducted; if too low, like a saturated solution of common salt, cataphoric effects will not be pronounced.

With a view of ascertaining if discolored teeth could be actually and practically bleached by cataphoric medication, I performed the following experiments, assisted by Mr. Wm. J. Evans, of McKesson & Robbins, who kindly supplied the teeth, the pyrozone and other chemicals required. But first, a word as to the necessary outfit. This should constitute (*a*) a galvanic battery of at least 40 Leclanchè cells, or of 30 red acid or Poggendorf cells, as sold in the ordinary portable battery, for a voltage of at least 60 volts is required; (*b*) a rheostat; (*c*) a milliamperemeter, and (*d*) a needle holder for platinum wire.

The experiments were as follows, omitting numerous ones made for control, or those affording no definite results:

The first point was to establish if solutions of H_2O_2 would conduct electricity.

Experiment 1.—H_2O_2 25 per cent., plus sulphuric ether 75 per cent A few drops laid upon a glass plate, platinum wire electrodes placed ½ inch apart, 40 cells equalling about 60 volts, gave only about one milliampere of current, a current strength too small for practical work.

Similar solutions of the same strength of H_2O_2 in chloroform, glycerol and distilled water gave in the first two instances no current, and in the latter about two milliamperes.

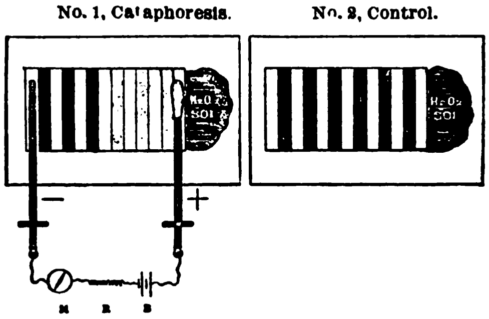
Experiment 6.—H_2O_2 25 per cent., plus sulphuric ether 75 per cent., plus dilute sulphuric acid a mere trace, gave 20 milliamperes, namely, sufficient for practical work if so desired.

Experiment 8.—H_2O_2 25 per cent., plus sulphuric ether 75 per cent., plus solution of chloride of sodium, afforded electric conduction, but the solutions did not mix, and therefore were impracticable to work with in that form.

Experiment 11.—A molar tooth containing a large cavity, leaving half of its crown still intact. The enamel of the crown was badly discolored by organic decomposition; the central divisions of the dentinal tubuli were well exposed; contrast was made by comparing it with another tooth to match the color, so that the shade could be determined. Cavity packed with absorbent cotton; rubber-dam adjusted, and the roots of the tooth imbedded in a piece of beef meat. Cotton was tightly wound about the platinum wire, constituting the positive electrode; the negative was another wire inserted into the beef about one inch away from the imbedded tooth.

Solution of chloride of sodium, two-fifths of a cubic centimeter, and one and three-fifths cubic centimeter of H_2O_2 25 per cent., water 75 per cent., made by shaking two parts of pyrozone 25 per cent. solution with one part of water, and separating the fluids in a funnel, was dropped on to the cotton with a pipette; the current was turned on and very quickly dried it, which was indicated promptly by the fall of the needle of the milliamperemeter, and more solution was continuously added. The darkened portion of the tooth bleached perceptibly white within a minute; current strength 25 milliamperes. Then about the same number of milliamperes was employed during five minutes; enamel perfectly bleached. The bleaching action was also evident at the ends of the roots of the tooth, the H_2O_2 having been conveyed there by way of the open pulp canals. These latter therefore, in actual practice, if exposed, should be closed by a non-conducting cement.

Experiment 12.—Two pieces of blotting paper, 1 x 2 inches, each laid on a glass plate, and six bars of blue litmus paper laid across the blotting paper thus:



No. 1, Cataphoresis. No. 2, Control.

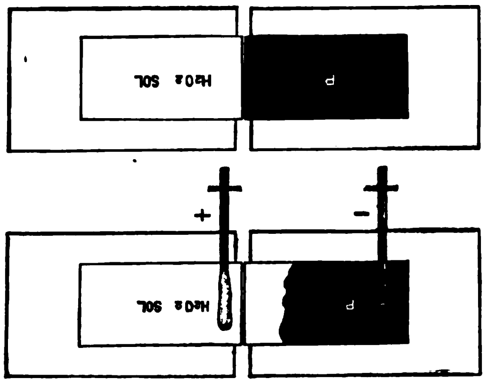
M, Milliamperemeter; R, Rheostat; B, Battery.

Two cubic centimeters of 25 per cent. aqueous solution H_2O_2 applied on glass at end of blotting paper; 50 milliamperes current. Blotting paper wet with a weak solution of chloride of sodium; current turned on. Almost immediately in No. 1 the litmus paper at the positive end began to bleach, and this bleaching progressed in perceptible steps towards the center, until within 4½ minutes the litmus paper on the positive end (three bars of it) was completely bleached of its blue color. The control experiment showed no change, proving that ordinary diffusion or chemical osmosis was not the cause of the result obtained in No. 1.

Experiment 13.—Four pieces of blotting paper, 1 x 2 inches, two pieces saturated with a decinormal solution of permanganate of potassium, U.S.P.—this stained them a chocolate color, two pieces saturated with 25 per cent. aqueous solution of H_2O_2. Each piece of permanganate paper was brought into juxtaposition with each piece of H_2O_2 paper. No. 1 for cataphoresis, No. 2 for control. (See illustration).

The H_2O_2 pieces of blotting paper were previously moistened with a solution of sulphate of soda; 50 milliamperes of current strength were applied as indicated by the platinum electrodes in the illustration. The encroachment of decolorization of the permanganate paper was noticed at once in No. 1; it progressed steadily, and at the end of five minutes had extended about one-third of an inch, thus proving cataphoric action, while the control, namely No. 2, showed but a trifling decoloration at the point of immediate contact.

No. 1 Cataphoresis.



No. 2 Control.

P, Permanganate solution.

EXPERIMENT 13.

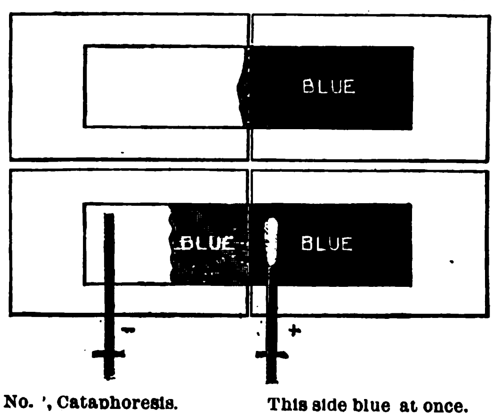
Experiment 22.—Four pieces of blotting paper, each one 1 x 2 inches, were laid in pairs upon glass plates, so that the edges of each pair could be brought into contact. The blotting paper was wet with a solution of soda. Then four pieces of ozone test paper of about the same size were laid upon the pieces of blotting paper, the ozone paper in this way becoming slightly moist with the solution beneath it. This white ozone paper gives a bright blue reaction to H_2O_2.

See illustration, showing in No. 1 the control experiment, and in No. 2 the cataphoric effect which occurred, placing pyrozone, 25 per cent. solution ethereal, upon the right-hand papers. These, of course, were immediately colored blue. The pieces of glass were now so moved as to permit the pieces of paper to touch, and in No. 2 the current was turned on up to 50 milliamperes.

---

* From the Philadelphia "Dental Cosmos."

The result was most striking and most conclusive, for the H_2O_2 solution under the electric influence straightway began to invade the previously white paper and colored it blue for half of the distance toward the negative electrode, while in the control experiment little or no blue color was produced upon the white paper, except for a trifling distance from the point of contact.



EXPERIMENT 22.

CONCLUSIONS

1. Cataphoric action is a demonstrable property of the galvanic or continuous current.

2. The negative pole must be placed at some part of the body comparatively distant from the tooth, for instance the cheek, hand, back, or breast.

3. The pulp canals, if exposed, should be closed by a non conducting cement.

4. Solutions for cataphoric action should, if spirituous, aqueous, or with glycerol, be associated with some substance which makes them better conductors of electricity.

5. Experiment 22 teaches this most important fact, namely, that while ethereal solutions of H_2O_2 do not conduct electricity, and cannot therefore be used by themselves for cataphoric action, still this effect can be readily obtained when the porous material which holds such an ethereal solution has been previously moistened with a solution of sulphate of soda or some similar conductor.

6. The efficacy of bleaching agencies, as, for instance, H_2O_2 solutions, is greatly enhanced by the concomitant aid of electricity, namely, by cataphoresis.

A New Use for Accumulator Chests.

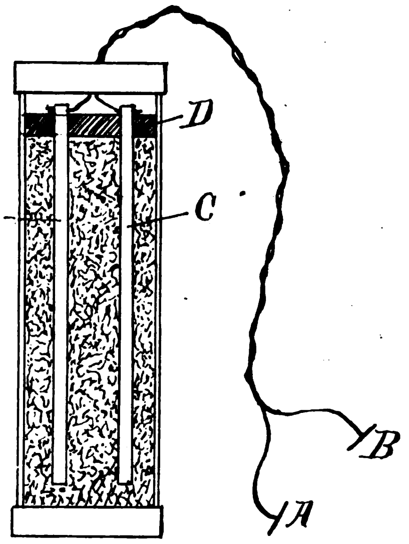
The Belgian customs authorities have discovered an ingenious smuggling trick. In the luggage-van of the express which runs between Paris and Brussels is a case which holds the accumulators when the train is electrically lighted. The guard of the express, a foreman porter, and an excise official of the border station Quèvy possess a key of this case, which, as a rule, no one thinks of examining. The other day, however, as the train ran into Quèvy, a customs inspector took it into his head to open the chest, and to his amazement he found snugly ensconced therein watches, chains, rings, bracelets, and other dutiable jewelry to the value of 7,000f. The guard and the foreman porter were quietly but firmly detained in Quèvy pending inquiries, which ultimately showed that the porter had for a long period been carrying on a contraband traffic for a well known jeweler, who, it is said, will be a heavy sufferer by the disclosure of his frauds on the customs officials.

THE THERMO-OZONE BATTERY.

Another Electro-Medical Fraud.

We have in the past received numerous letters from earnest parties inquiring as to the merits of Dr. Beckwith's so called thermo-ozone battery, to all of which we have replied by letter exposing its pretensions in no uncertain terms. The time has come, however, when it seems advisable to publicly expose its fraudulent nature, first, by reason of our further inability through lack of time and desire to reply to such letters, and second, because the device comes before the public with the indorsement of several gentlemen known to the electrical profession, who probably through ignorance have allowed their names to be used. These gentlemen are Messrs. W. T. Eckert, T. T. Eckert, Jr., Francis Broadnax and E. G. Cargill. Three of them are personally known to us, and it is with deepest regret that we see their names used as indorsers of a fraud as unmitigated as that of the electropoise, actina or the electric belt. We would gladly spare these gentlemen the pain of a well-merited rebuke, but there is a duty which we owe to the public as well as to ourselves which compels us to take the stand we now do.

In a little pamphlet issued by Dr. Beckwith it is stated that one of the editors of this paper "visited us February 28, 1895, and stated that he desired to make a full examination of our invention, and was ready to expose and publish any wrongful claims that were made respecting it." So far the statement is absolutely true, but it goes on: "The examination lasted nearly three hours, when he stated that the invention was scientifically constructed and capable of generating a thermal current of electricity. He procured a battery for Mrs. ——— and requested us to take charge of her case."



BECKWITH'S THERMO-OZONE BATTERY.

This is absolutely false. We made no examination of the battery at the time further than to take it apart so as to see the inside arrangement and to listen to the theories of its promoter. We did procure a battery—not for use of the party mentioned, nor was she placed in Dr. Beckwith's charge. Our procuring of the battery was for the purpose of testing it electrically.

The pamphlet goes on to say: "His opinion and conclusion are of more intrinsic value than volumes of sentimental testimony."

This being the case it gives us unusual pleasure in expressing our opinion of the battery and the claims of its promoter.

The accompanying cut is a sectional view of the so-called thermo-ozone battery, which may be described as follows:

It consists of a brass tube, $1\frac{1}{4}$ inches outside diameter and 5 inches long, hermetically sealed at either end with gutta-percha plugs over which are screwed brass caps.

Inside of the tube are placed two slender rods $\frac{1}{4}$ inch in diameter—one of copper and the other of zinc—marked in the sketch C and Zn. Around these is tightly packed a dry powder. These rods extend at their upper end through the gutta-percha plug D and to them are attached flexible cords terminating in the electrodes A and B, by which the battery is applied to the person.

The construction of the battery is such that it is entirely watertight, and the method of using it is to place the cylinder in a vessel of cold water (a la electropoise), and apply the electrodes. Now one of the claims is that a thermo-current of electricity is thus generated, and another is that there is also a galvanic current. As a matter of fact, the construction is such that a thermo-current would be impossible under any conditions, and a galvanic current equally impossible so long as the powder remained dry. Careful tests have shown the total absence of electrical currents under the conditions of use. If water is admitted to the cylinder a very slight current will flow for a very short time, but the battery polarizes so rapidly that this soon practically ceases.

Another claim is that by means of this battery drugs may be administered through the skin by what is termed electrical osmosis or *cataphoresis*. Drugs can be so administered under certain conditions by the assistance of the electric current, but it would be impossible to so administer it by this device, even supposing that it gave a current, for it would require something over sixty of the cells joined in series to produce any effect, because of its extremely low electromotive force. The battery gives no current, however, unless it leaks, and the one we examined did not leak at all.

Another claim is that it introduces ozone into the circulation. In the first place, gases cannot be administered by cataphoresis, and in the second place this battery could not under any circumstance whatever produce the slightest trace of ozone. Very high potentials are required for this, and even if these were at hand, the method of applying the electrodes to the body are such as to practically preclude its formation. There is still another point. Supposing that the ozone were generated and introduced into the system by cataphoresis, the results would certainly be disastrous—perhaps fatal.

In the popular mind, ozone is health-giving, revivifying and beneficial in every way. This is a misconception. It is most violent in its action, and even when inhaled in small quantities produces alarming symptoms. To introduce it into the blood would be suicidal.

To conclude, then, the battery itself has nothing scientific about it, but is a bungling and cheap attempt to deceive, and in the second place the theory which Dr. Beckwith advances, and by which he hopes to mislead the public as to its curative properties, is as bungling and unscientific as the battery itself.

Personal.

Mr. Walter H. Knight has resigned his position with the General Electric Company, and will engage in engineering on his own account.

J. M. Davey, late superintendent of the American Electrical Manufacturing Company, St. Louis, was a New York visitor last week.

Mr. J. T. Hambay, general manager of the Beacon Lamp Company, Boston, Mass., has completed a swing of the Western circle and reports the indications for fall trade to be favorable.

Mr. James I. Ayer has just returned from Bar Harbor and looks brown and rejuvenated.

Mr. J. H. Rhotehamel, who is as well known as the popular Columbia lamp, was in the city last week, looking happy and feeling jubilant over recent large awards in competitive bids based on merit alone and *not* on prices.

General News.

What is Going on in the Electrical World.

Harvard, Ill.—An electric lighting plant is to be established here in the near future.

Uxbridge, Mass.—There is some talk of connecting Milford with Oxford by an electric road.

Milaca, Minn.—This village has voted to bond itself to put in electric lights and water works.

Pasadena, Cal.—The Pasadena and Los Angeles Electric Railway has been completed at a cost of nearly $400,000.

Elyria, O.—James L. Mauldin, of Cleveland, has been granted a franchise for an electric road between this city and Lorain.

Summit, N. J.—The township committee have decided to accept C. P. Bassett's bid for supplying the town with electric lights.

Henderson, Ky.—The city council has ordered an election to be held September 24 to decide whether Henderson shall have electric lights.

Ocala, Fla.—John R. Martin has secured $9,000 of the $10,000 wanted to build the Ocala and Silver Springs electric road, and a survey is being made.

Cincinnati, O.—Carroll B. Vastine, of Chicago, has organized a $500,000 company to manufacture soap by a process in which electricity will be used.

Hyde Park, Pa.—William Farrel has submitted to the board of trade a proposition to establish an electric light plant in Hyde Park, utilizing the culm banks in the neighborhood as a source of power.

Wilmington, Del.—The survey of the route for the proposed Chester and Wilmington electric road between Claymont and Shellpot has been completed.

Santiago, Cal.—George B. Kerper, owner of the Santiago Cable Railway Company, will change the system to electricity, and will extend the line to National City.

Anapee, Wis.—The electric light plant in this city, owned by Joseph Wodsedalek, was destroyed by fire on the 6th inst.; the plant was valued at $20,000.

Pawtucket, R. I.—The Dunnel Manufacturing Company have substituted electric motors for steam power in the operation of their calico printing machines.

Freeport, Ill.—The South Freeport and Cedarville Electric Railway Company has petitioned the council for a franchise to operate an electric car system in this city.

Spokane, Wash.—The Consumers' Light and Power Company has been granted a fifty-year franchise and has ordered the entire plant for a large electric light system.

Killingly, Conn.—The Killingly and Brooklyn Street Railway Company is to establish an electric street railway to connect the surrounding villages with Danielson.

Nebraska City, Neb.—An Eastern firm has written to Mayor Bartling offering to buy the present horse-car company's interest and franchise and put electric cars on the line.

Rantoul, Ill.—The Rantoul Electric Company has been granted a franchise to put in an electric light plant. The Western Electric Company of Chicago will furnish the plant.

Franklin, N. H.—Franklin is to have an electric street railway. At a recent meeting of local capitalists a strong company was formed with Hon. Warren F. Daniel as president.

Watkins, N. Y.—The early construction of the proposed Watkins and Havana Electric Railroad is hoped for as a number of New York capitalists have become interested in the project.

Williamstown, Mass.—Construction work on the electric road between this town and North Adams is in progress; it is expected that the road will be in running condition in about two months.

Phœnix, Ariz.—The Phœnix Light and Fuel Company and the East End Electric Light Company have been combined by the sale of the East End (Gardiner) works to the Light and Fuel Company.

Newport News, Va.—It is understood that O. P. Loomis, a manufacturer of dynamos, motors and other electrical appliances, intends to remove his works from Bound Brook, N. J., to Newport News.

Fort Wayne, Ind.—Arrangements have been made with the Toledo Construction Company for the building and equipment of the Fort Wayne, Lake Everett and Columbia City Electric Railway.

Baltimore.—The branch line of the City Passenger Railway from Baltimore street to Camden station is now operated by electricity. This was the last horse car in the city except the Traction Company's Waverly line.

Jacksonville, Fla.—The Jacksonville, St. Augustine, Palatka and Tampa Electric Railway Company, recently organized with a capital of $200,000, expect to have a part of the line, if not all, in operation next winter.

Nevada, Mo.—Col. Geo. W. Dudley, of St. Louis, has been granted an electric light and power franchise by the city council. Col. Dudley will buy the horse car system in this city and equip and operate it as an electric road.

Warren, O.—The county commissioners have granted the Trumbull Electric Company a franchise from Warren to Leavittsburg.—The Mahoning Valley Electric Railroad Company has been granted a 25-years' extension of its franchise.

Allegan, Mich.—The Harrison Electric Light and Power Company have just closed a deal whereby they become the owners of the Edison Allegan Light Company's plant. They will build a large brick plant near the old one and consolidate the two.

Lima, O.—Local capitalists are taking up the right of way for an electric line between this city, Wapakoneta, and St. Marys. The projected line will pass through a number of small towns, which it is intended to supply with electric light.

Jersey, City, N. J.—It is probable that new bids for lighting this city will be advertised for as soon as the corporation counsel decides whether the street and water board can give out the contract at once or must wait until the beginning of the next fiscal year.

Morristown, Tenn.—The Morristown electric light plant has been sold at auction and bid in by the General Electric Company of Boston for $4,000. The company intends to continue operating the plant after making some needed repairs on the machinery.

Toronto, Can.—The Toronto Railway Company, which operates by electric power the only street railway in Toronto, has recently issued £823,000 of first mortgage 4½ per cent. sterling bonds. Of this amount £250,000 was issued in Canada, and the remainder in London.

Brooklyn, N. Y.—At a meeting of the shareholders in the bicycle railroad scheme, a few days ago, F. W. Dunton said the construction of the road would begin as soon as $100,000 had been paid in. Up to the date of the meeting $62,204.60 in cash had been received and was deposited with a trust company.

Schenectady, N. Y.—It is now announced as a certainty that the General Electric Company is to concentrate all of its plants in this city. Work on the necessary buildings will begin at once and as soon as completed the works at Lynn, Mass., and Harrison, N. J., will be closed and the plants brought here.

Little Rock, Ark.—The Little Rock and Little Rock Edison Electric Light companies have consolidated under the name of the latter company and under the management of J. A. Van Etten. The following officers were elected: Dr. C. M. Taylor, president; S. R. Allen, secretary; Oscar Davis, treasurer.

Niagara Falls.—The Niagara Falls and Lewiston Railroad Company has elected the following directors: John M. Brinker, Robert W. Jones, F. C. M. Lautz, Daniel O'Day, Herbert P. Bissell, D. N. Evans, W. S. Pitman, Frank M. Brinker, Bert. L. Jones, C. D. R. Stowits, Charles R. Huntley, E. T. Brinker and F. A. Mohr.

Youngstown, O.—A new electric company, composed of H. F. Kaercher and others, has been formed here, and has come out as a rival to the Youngstown Electric Light Company, which has had a monopoly. The new company has asked for a franchise, and agrees to furnish electric light 25 per cent. cheaper than the old company.

Tuskegee, Ala.—A proposition has been made to the citizens here by a party who is connected with the electric power company of Montgomery to build an electric line from this place to Chehaw on the Western road. It will be built, it is said, if the citizens will donate $5,000 and the right of way. An effort will be made to raise the amount.

St. Louis, Mo.—Bids will be received until September 6 for a twenty-ton electric travelling crane for High Service Pumping Station No. 3.—Articles of incorporation of the International Electric Company have been filed here. They show a capital stock of $15,000, fully paid. The firm will manufacture incandescent lamps and other electrical appliances.

New Castle, Pa.—J. S. Hays, formerly chief electrical engineer for Andrew Carnegie, and Robert Peebles of this city have consummated a deal by which they become owners of the stock of Hon. J. R. Finley of Monongahela City, Pa., in the New Castle Electric Power and Arc Light Company, the incandescent plant and New Castle Artificial Gas Company.

Marion, Ind.—R. A. Page and C. H. Grant, of Chicago, have been here making investigation in regard to the building of an electric railroad from this city to Chicago, and especially looking after the right of way from Marion to Logansport, which part will be built first. The exact eastern terminus has not yet been decided upon but will probably be in the gas belt.

Toledo, O.—It is reported that the Toledo and Maumee Valley Electric Railway Company has practically secured the complete right of way for its tracks from Perrysburg to Bowling Green. The company has had this scheme in contemplation for several months, but has not until a few days ago been able to secure the right of way through Wood county to the county seat.

Santa Cruz, Cal.—An "electric cycle road" between this city and Capitola is projected by a number of prominent citizens. The plans and specifications of the new road have been drawn. It will be built on the L. C. Presley railway system, engineered by D. E. Condon, the builder of the San Francisco City Hall dome. The cars will carry freight as well as passengers. A speed of at least seventy miles an hour is expected.

New York.—The Board of Fire Commissioners have come to the conclusion that the present system of fire alarms in this city needs improving and extending, and hope to accomplish this by a more general use of auxiliary fire-alarm boxes, by placing them in private houses, factories, lumber yards, dock sheds, etc. A minute or two gained in notifying the firemen will, it is believed, result in saving much valuable property.

Chicopee, Mass.—The city government has passed an order authorizing the city to make a contract with Daniel G. Canty for the erection of an electric light station according to plans submitted by F. R. Richmond, architect, the price thereof not to exceed $16,500. An order was also passed to procure plans and specifications for the equipment of the plant; also an appropriation of $20,000 was made for the purpose of erection and equipment of an electric light station.

Pottsville, Pa.—The Williams Valley Street Railway Company has secured right of way over the whole of the route between Tower City and Lykens, and will begin the construction of the road at once. The directors of the company are William A. Marr, of Ashland; Moses Mervine, of Reading; George Cockill, Peter Cress, E. C. Wagner and J. H. Babb, of Girardville. Chas. H. Barmhardt, of Girardville, is the secretary and treasurer of the corporation.

Richfield Springs, N. Y.—The trustees of this village a few days ago gave a hearing to those interested in the Little Falls and Richfield Springs electric railroad. Several prominent men advocated the building of the road, while others were opposed, one of the latter objecting that "it would bring Sunday visitors to Richfield Springs," and another that "he was opposed to common people visiting Richfield where $10 a day people were wanted." The hearing was adjourned to the 28th inst.

Pittsburg, Pa.—The board of trustees of the Carnegie Library have awarded the contract for the electric light plant for the building to the Westinghouse Electric and Manufacturing Company. The plant contracted for will cost about $18,000. The board of trustees have determined to make the Library the best lighted public building in the United States, and believe the arrangements of electric lights fixed upon will give the desired results.--The *Leader* states that the Westinghouse Company paid out to its employees at Brinton on the 9th inst. one of the largest pays in its history. About $160,000 was divided among the 8,500 hands for two weeks' work.

Sacramento, Cal.—The *Bee* says: "One of the most marvelous exhibitions in the world's history will be seen in Sacramento on the night of the 9th of September. That is a broad assertion to make but Sacramento stands ready to back it. There have been electrical displays in this and other countries, but no city has yet gone far enough to have a carnival. Sacramento will have one, and it will be a 'peach.'" In the procession will be six floats, brilliantly illuminated, symbolizing local and historic events connected with the introduction of electricity. Electrically illuminated arches will span the streets, and the parks and prominent buildings will be lit up to the best advantage.

Appleton, Wis.—The Appleton Edison Electric Company is in a peck of trouble. The city council has revoked its street railway charter and annulled its contract for street lighting, and the company has been placed in the hands of a receiver, A. Ledyard Smith, on the application of the New York Security and Trust Company, which sets forth that the company is insolvent and unable to pay interest on its bonded indebtedness. The company admits the truthfulness of this allegation and has filed a statement of its indebtedness, amounting to $189.510, of which $77,580 is bonded indebtedness and $111,930 is composed of claims for wages and unsecured debts.

Jefferson City, Mo.—A syndicate of Iowa capitalists, who have recently bought the famous Gunter spring in Camden County, Mo., and 5,000 acres of land surrounding it, propose to build an electric railway connecting Jefferson City with the spring and also to put in a mammoth electric plant at the spring to be operated by water power. They say that there is power enough at Gunter to supply the entire State with electricity. It is one of the largest, if not the largest spring in the world, bursting forth a river at the foot of one of the highest peaks of the Ozark mountains. It is surrounded by some of the most wildly picturesque scenery on the continent.

San Francisco, Cal.—The *Call* states that the Clear Lake Electric Company has about perfected arrangements for converting the waste water power of Clear Lake, Lake County, and Cache Creek (about seventy miles from San Francisco) into electric energy that will be transmitted to San Fransisco, Oakland, Benicia, Mare Island, Vallejo, Santa Rosa and other cities along the line, where it will be used to give light and power. The water will be carried in five-foot pipes from the dam, to be erected at Cache Creek, to a point known as Wilson's Farm, a distance of 12 miles, where the power plant will be established, and in traversing that distance will have a fall of 454 feet. In connection with the transmission scheme an electric railroad is to be built connecting Clear Lake with the town of Rumsey.

St. John, N. B.—R. P. Strand, organist of Trinity Church in this city, is the inventor of a new electric organ which is said to be an improvement on those hitherto in use. "It is simply wonderful," says a local authority, "to see the amazing rapidity with which the most florid passages can be executed. Trills and reiterated notes which have hitherto been a laborious task are rendered in the easiest manner possible on this organ. One great point the inventor claims is that he has swept away the troublesome pneumatics from every part except the draw-stop action, and here, where there is no quick repetition needed, they are not open to the same objections. The organ is operated by a direct electric system. There is no intermediary between the magnet and the valve, therefore the response is absolutely instantaneous."

All About Block Signals.

"Block Signals on the New York Central," the latest addition to and No. 17 of the popular "Four-Track Series" of "America's Greatest Railroad," is from the press of the American Bank Note Company; contains 64 pages, narrow octavo, beautifully printed on coated paper and illustrated with graphic pictures of signal apparatus and its application to the traffic of a great railroad. The text is from the pen of a celebrated English expert on Block Signals, and the subject is treated in a way that cannot fail to interest the average traveler as well as the technical engineer. It is believed that this, the latest of railway safety devices, has never before been so thoroughly and comprehensively described and illustrated as in this book.

A copy will be mailed to any address, free, postpaid, on receipt of three 2-cent stamps, by George H. Daniels, General Passenger Agent, Grand Central Station, New York.

COMMERCIAL PARAGRAPHS.

"Compressed Air" is the title of an elaborate publication, otherwise known as Catalogue No. 8, just issued by the Clayton Air Compressor Works, Havemeyer Building, New York. The book is richly illustrated and contains a description of the manifold applications of this form of power.

The Swinging Ball Lightning Arrester, manufactured by the George L. Colgate Company, 136 Liberty street, New York, has met with constantly increasing favor among managers of electric power plants during this season. The sales largely exceed those of all previous seasons combined.

The Delaware Hard Fibre Company, Wilmington, Del., have recently more than doubled the capacity of their plant and are now running night and day. They have just been awarded the contract for supplying the General Electric Company with fiber.

New Beacon Lamps.

With the reorganization of the Beacon Lamp Company, Boston, the manufacturers of the well-known Beacon Lamp are now equipped to produce lamps in large quantities and at fair prices. Every variety of lamp for commercial use, including series, multiple and miniature decorative lamps, will be made.

Columbia versus Edison.

After numerous comparative tests made by a large central station in this country of the new type Edison and Columbia lamps, the results attained show that after 500 hours' burning the Edison lamps gave but 7 C. P., while the Columbia, after 600 hours gave 18¼ C. P. As a result of these tests an order was placed for 20,000 Columbia lamps, and a previous order for a like number of Edison lamps was cancelled. The net price for each Columbia lamp was five cents higher (or $1,000 on the total order) than the price of the Edison lamp but the purchaser did not hesitate to pay the difference.

Wheeler's Electric Switch.

This switch was invented by L. Wheeler, a motorman in the employ of the Sioux City Traction Company. The only one in operation is that at the junction of Pearl and West 7th street lines, Sioux City. The apparatus consists of electric magnets in a water tight box built of iron with wooden lining to hold the magnets firm and to separate them from the iron so as not to affect their magnetism. The rod connecting the armature with the switch tongue is enclosed in an iron case, which is screw fitted to the iron box with packing box at the end of the case. This rod is fitted with a device for lengthening and shortening if affected by the temperature, also with rubber cushions for lessening the concussions. This part is in the ground, about four inches below the switch. The car device for operating the switch consists of an iron tube supported in front by a hinge, and so constructed as conduct the return wire from the controller to a steel brush under the platform of the car. When the brush is up the return current runs to the ground in its usual course, but when the brush is down the return current passes to a false rail placed between the track rails about thirty feet from the switch and which is connected by wire with the electro magnets. The brush is held in position by a steel coil spring or weight, and is lowered by pressure of the foot on a treadle. If the switch is not in proper position just before the car passes over the false rail the motorman puts his foot on the treadle and causes the steel brush to come in contact with it, and as stated above, the return-current passes to the false rail, thence through the wire to the magnet, which pulls the armature to it and so turns the switch tongue. After passing the switch, if desired, it can be reset, thus leaving it as it was originally. In gathering up the points of the switch it will be seen that the car device does not interfere with the drawbar in any shape or form; that the return current is used; that the false rail can be placed far enough from the switch to enable the motorman to see that the switch is set before he reaches it, thus avoiding the necessity of ever backing the car because of a failure to throw the switch; that there is permanent magnetism enough to hold the switch tongue firm till the rear wheel and trailers have passed over the switch, thereby saving possible derailment and accident; that the switch can be reset at will, after the car passes over it; that in cold weather if the switch tongue is frozen fast and cannot work there is no possible chance for breakage as is the case when switches are operated by some mechanical device; that if the apparatus, or car device, gets out of order in any way a switch hook can be used as if no switch throwing apparatus were attached. The device can be attached to any electric car and not interfere with its work.

BUSINESS HINTS.

Public Buildings, Theaters, Residences, &c., Proposed or in Course of Construction.

[The following summary is prepared weekly for ELECTRICITY for the information of advertisers and readers who are dealers in apparatus and articles required in the electrical equipment of public and private buildings.]

Augusta. Me.—Plans have been prepared by Architect John C. Spofford for a new city building to be erected here; the clerk of the city council can furnish detailed information.

Brooklyn, N. Y.—G. B. Dearing will build a seven story flat in Lefferts Place, east of Classon ave.....C. Welcher will build 4 three story apartment houses, north side of Granite st., east of Broadway....Benjamin Wolf will build 18 four story apartment houses, on east side of Powell st., south of Sutter; also a four story apartment house, southeast cor. of Powell st. and Blake ave.; also a four story apartment house, southeast cor. of Powell st. and Sutter ave.

El Paso, Ill.—A new Christian Church is to be erected here; the structure will be lighted by electricity.

Ithaca, N. Y.—Plans are being prepared by Architect Miller for a new residence to be built for O. L. Beane; specifications call for modern improvements.

Kansas City, Mo.—Plans have been prepared by W. W. Rose for a five story office building for F. T. Altman at 11th and Walnut sts.; two passenger elevators will be introduced.

Montpelier, Vt.—Work will soon be commenced on the erection of a new residence for H. S. Colton, on 1st ave.; the specifications call for the most modern improvements.

Newark, N. J.—Plans have been submitted to the committee of citizens who have organized for the purpose of building a new hotel in this city; estimated cost, $500,000.

Newburg, N. Y.—Plans have been prepared for the completion of the Federal Building in this city; Supervising Architect Aiken, of Washington, D. C., can be addressed.

Newport, R. I.—It is reported that a handsome country residence is to be built on Narragansett ave. in this place by Robert Goelet; every modern improvement will be introduced.

New York City.—A fire-proof mercantile eight story building will be erected at 118 West 34th st. for Amund Johnsen; Architect George Keister, 140 West 34th st....A five story fire-proof factory will be erected at 519-521 West 58th st. for W. and H. Zinsser; Architects Delano & Cordes, 130 Fulton st....Leopold R. Trou will build a seven story warehouse at 150 Bleecker st....Architects Flagg & Chambers have prepared plans for a skating rink and club house for the St. Nicholas Skating and Ice Co. at West 66th st. near Columbus ave; the structure will be provided with the latest improvements....Miss Serena Rhinelander, 14 Washington Square, will erect a three story club house, south side of 85th st., west of 1st ave.....Ormiston Tait has plans in preparation for a seven story apartment house at northwest cor. of West End ave. and 91st st. for Frederick Haas; the building will contain elevators, electric wiring, fixtures, etc....Architects Neville & Bagge, 215 West 125th st., are preparing plans for 2 five story flats, on 80th st., east of Amsterdam ave., for Joseph Cirrito; also for a five story flat and store building, which Bingham Bros. are to erect at 152d st. and St. Nicholas ave....Steven Upson, of Athens, Ga., will build a seven story apartment house, after plans prepared by a New York architect, at northeast cor. of 112th st. and 5th ave....Thomas E. Satterthwaite, 531 5th ave., will build five story brick dwelling, south side of 55th st., west of 5th ave....Henry H. Vail, 179 West End ave., will build a four story and basement brick dwelling at Riverside Drive and 75th st....Theo. A. Cordier, 1 East 166th st., will erect a five story brick store and flat building, at cor. of 166th st and 4th ave., at a cost of $141,000; Architect John Hauser....Plans have been prepared by C. P. Gilbert for a four story brick residence at Riverside Drive and 74th st., for George S. Macy, 61 Park ave.

Pittsburg, Pa.—A 16 story building is to be erected at 5th ave. and Smallman sts., to be known as the Park Building, for Wm. G. and David E. Park, Architect George B. Post, 33 East 7th st., New York City.

Rockford, Ill.—Bids will be received until August 31, by the Supervisors of Winnebago County, for a passenger elevator, direct acting, to carry 2,260 pounds safely at 200 feet a minute with a voltage of 250 at the engine and have a run of 31 feet more or less from the basement to the court room floor; all bids must include the plans and specifications and a full description of the elevator, also all needed changes in the building to put the elevator in place; Bernard Weber, chairman of Committee on Building and Grounds, 114 North Main st., Rockford.

Scranton, Pa.—An eight story office building is to be erected here at a cost of $150,000; Secretary D. D. Atherton can furnish detailed information.

Toledo, Ohio.—Architect Sturgis is preparing plans for a $35 000 music hall to be erected on Madison st. by W. H. Currier.

Washington, D. C.—Hause & Herrman will build a six story brick store at 901 7th st. N. W., to cost $50,000....Mrs. McKnight Moses will build a handsome residence at 2106 16th st. N. W., Architect W. J. Marsh.

INCORPORATIONS.

The Octoraro Telegraph and Telephone Company, with headquarters at Oxford, Pa, has filed articles of incorporation. The officials of the new corporation are: President, S. Ralston Dickey, Oxford; vice-president, Edgar L. McSparren, Goshen, Lancaster County, and secretary and treasurer, Eli McKissick, of Oxford.

Arrangements are being made to incorporate the Fayette County Telephone Company at Vandalia, Ill., with a capital stock of $5,000. An exchange will be established in Vandalia, and lines will be run from Ramsey and Shobonier and Brownstown and Hagerstown.

The Phœnix Telephone Company, Indianapolis, Ind., has elected the following officers: R. K. Syfers, president; Charles F. Smith, vice-president; A. B. Gates, secretary and treasurer, and George W. Stout, Charles A McCleary, E. M. Churchman and W. N. Gates, directors.

The Brothers Electric Cable Crane Company, Newark, N. J.—to manufacture, buy, sell and deal in electric cables, cranes, electric apparatus, cars, boats, engines, boilers, motors and all kinds of machinery, life-saving apparatus, etc. Capital stock, $6,000 Promoters: Wm. F. Brothers, Sarah E. Brothers, Brooklyn, N. Y.; Isaac R Brown, Jr., Maria A. Brown, Plainfield, N. J.

The Clarksville Cotton Oil Company, Clarksville, Texas—to manufacture and sell cotton and its products, supply the city with water and electric light, and manufacture and sell ice. Capital stock, $50,000. Promoters: D. W. Cheatham, J. M. Aydelotte, Jos. M. Sivley, John W. O'Neall, Clarksville, Texas; F. H. Bailey, Paris, Texas.

The City of Weatherford Water, Light and Ice Company, Weatherford, Texas—to supply water and electric light and motive power to the citizens', and manufacture and sell ice. Capital stock, $8 ,000. Promoters: M. H. Arnst, Platt V. Bryan, Elmira, N. Y.; G. A. Holland, W. P. Anderson, Weatherford, Texas; W. T. Hudgkins, Texarkana, Texas.

The Denver, Globeville and Golden Rapid Transit Company, Denver, Col.—to construct and maintain street railway lines, to operate by electricity, cable, gas, or any other motive power. Capital stock, $100,000. Promoters: Lewis E. Lemen, Geo. S. Parsons, Irving F Root, Denver; R. R. Lingo, North Denver; S. R. Wright, Highland, Col.

The Valparaiso Light and Fuel Company, Valparaiso, Ind.—to engage in the purchasing, owning, operating and maintaining of light, heat and power plants in Valparaiso. Capital stock, $50,000. Promoters: Chas. A. Sweet, Chas. Burgerson, E. F. Van Ness.

The Kokomo and Greentown Street Railway Company, Kokomo, Ind. Capital stock, $50,000. Directors: W. E. Snow, A. Avery, C. H. Hillon, J. S. McDonald, all of Detroit; F. H. Allen, of Kokomo.

The Mountain Electric Light Company, Summit, N. J.—to sell, build and operate electrical plants for lighting, heating and power, in Union, Morris and Essex Counties, New Jersey. Capital stock, $100,000. Incorporators: Carroll Bassett, Adolph Wagner and Frederick Green, all of Summit.

The Hinsdale Electric Light Works, at Chicago—to furnish light, heat and power. Capital stock, $2,000. Incorporators: Henry L. Gardner, Frank E. Bradley and Arthur M. Morgan.

The Electric Construction Company, Hartford, Conn.—to engage in general electric construction, and putting in telephones. Capital, paid up, $5,000. President, L. W. Fish; secretary, Harry P. Horne.

The Dunmore Electric Street Railway Company, Dunmore, Pa.—to build and operate a street railway between Dunmore and Scranton, and from Scranton to Carbondale. Capital stock, $75,000. Incorporators: P. J. Horan, of Dunmore, president of the company; I. H. Burns, E. J. Lynett, T. E. Boland and M. J. Sweeney.

The Mendota Light and Heat Company, Mendota, Ill—to furnish gas and electricity for light, heat and power. Capital stock, $25,000. Promoters: John Goedtner, Anton Kneigen, Geo. H. Madden, Newton Imus, Geo. C. Schuetz, Philip Erlenborn.

The Kane Electric Company, Kane, Pa.—to supply light, heat and power, or any of them, by electricity to the public in the borough of Kane, McKean County, Pa., and other persons, partnership, etc Capital stock, $1,000. Promoters: C. H. Kemp, F. A. Lyte, Joshua Davis, Thos. L. Kane, W. P. Weston, Kane, Pa.

The Argentine Water and Light Company, Portland, Me.—to manufacture and deal in gas, electricity and machinery, fixtures and apparatus, for gas works, water works and electric light works in the city of Argentine, Kansas. Capital stock, $150,000. Promoters: W. C. Eaton, Geo F. Noyes, Henry M. Verrill, all of Portland, Me.

The American Electric Fuse Company, Chicago, Ill.—to manufacture and sell electric fuse and fusible cutouts, and other electrical appliances. Capital stock, $25,000. Promoters: Eugene Hildebrand, Clarence E. Brown Ralph W. Bowman.

The Bennington Gas and Electric Light Company, Bennington, Vt.—to manufacture and distribute gas or electric light or both. Capital stock, $75,000. Promoters: Henry S. Jackson, Franklin S. Frisbie, Wm. H. Kimball, Geo. Senter, Benjamin V. Page, Boston, Mass.

The Washington, Woodside and Forest Glen Railway and Power Company, Washington, D. C.—to build and operate an electric railway. The officers are: Frank T. Browning, president; Julian C. Dowell, vice-president; W. Riley Deeble, treasurer, and Frederick Benjamin, secretary.

The Flavel Terminal and Townsite Company has filed articles of incorporation at Astoria, Ore. The object of the company is to build waterworks, electric railroads, warehouses, etc. Capital stock, $500,000. Incorporators: G. Wingate, Alfred Kinney and D. M. Stuart.

The Texas Telephone Company, Bonham, Tex. Capital stock, $5,000. Incorporators: J. G. McGrady, A. B. Cross and George M. Heard.

The Danville and Northwestern Electric Railway Company, Danville, Ill.—to construct and operate a railroad from Danville in a northwesterly direction through Potomac and Rankin, Vermilion County, to Gillman, Iroquois County, with a branch line starting north of Potomac northwesterly to Paxton, Ford County, and another branch commencing west of Danville, southwesterly to Fairmount, thence southerly to Sidell, Vermilion County, thence northeasterly to Georgetown, thence northerly to point on said line west of Danville. Capital stock, $100,000. Incorporators: William T. Cunningham, John W. Dale, William P. Chandler, W. S. Mathias and Robert Holmes, all of Danville; J. W. Layne and J. K. Butz, of Potomac, and W. W. Hatch, of New York City. The first board of directors are: W. T. Cunningham, William P. Chandler, W. S. Mathias, W. W. Hatch and Robert Holmes.

MOONLIGHT SCHEDULE FOR THE UNITED STATES.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED AUGUST 13, 1895.

ELECTRIC RAILWAYS AND APPLIANCES.

544,283. Conduit for Electric Conductors for Railways. Frank L. Capps, Newark, N. J. Filed Sept. 18, 1894.

541,306. Conductor for Electric Railways. Paul C. J st, Chicago, Ill., assignor to Albert G. Wheeler, same place. Filed Feb. 6, 1893.

544,312. Trolley for Underground Electric Railways. Myron D. Law, Washington, D. C., assignor to Albert G. Wheeler, Chicago, Ill. Filed Jan. 31, 1894.

544,313. Traveling Contact Device for Electric Railways. John C. Love, Philadelphia, Pa., assignor to the Love Electric Traction Company, Chicago, Ill. Filed Sept. 5, 1893.

544,391. Electric-Railway Conduit System. Lorenzo H. Sherwood, Mount Vernon, N. Y. Filed Sept. 7, 894.

544,471. Trolley Wheel and Bearing. Edmond Verstraete, St. Louis, Mo., assignor of one-third to Ernest G. Bruckman and Samuel E. Bruckman, same place. Filed Nov. 22, 1894.

ELECTRIC LIGHTS AND APPLIANCES.

544,331. Globe-Netting for Arc Lamps. Ernest P. Warner, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Sept. 18, 1894

544,503. Support for Incandescent Lights Charles A. Carmany, Middletown, Pa. Filed Sept. 8, 1894.

544,529. Electric-Arc Lamp. Richard H. Cunningham, Richmond, Va. Filed Sept. 8, 894.

544,578. Electric-Arc Lamp John H. J. Haines New York, N. Y., and Alexander B. Fernald, Jersey City, N. J. Filed Nov. 20, 1894.

544,579. Electric-Arc Lamp. John H. J. Haines, New York, N. Y., and Alexander B. Fernald, Jersey City, N. J. Filed Nov. 20, 1894.

544,6 4. Electric-Lighting Attachment for Gas-Burners, Frank A. Webb, Beverly, Mass., assignor of five-eighths to Rufus H. Woodbury and John B. Webb, same place. Filed March 11, 1895.

DYNAMO ELECTRIC MACHINERY.

541,289. System of Electrical Distribution. Stanley C. C Currie, New York, N. Y. Filed Nov. 27, 1893. Renewed Dec. 21, 1894.

514,339. Commutator Connection for Dynamo-Electric Machines. Henry H. Wait, Chicago, Ill., assignor to the Western Electric Company, same place. Filed March 1, 1895.

44,343 Magnet-Forming Machine. Orlando P. Briggs, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Jan. 20, 1894.

514,358. Commutator-Brush Holder. George J. Junker, Mount Vernon, Ill. Filed Nov. 9, 1894.

54 ,361. Construction and Method of Operating Dynamo-Electric Machines. Frederick H. Loveridge, Coldwater, Mich. Filed Aug. 2, 1894.

541,365. Synchronism-Indicator. Ralph D. Mershon, Pittsburg, Pa. Filed Nov. 2, 1894.

544,396. Winding of Dynamo-Electric Machines or Motors. Elihu Thomson, Swampscott, Mass., assignor to the General Electric Company, of New York. Filed Jan. 27, 1894.

544,6 3. Combination-Dynamo. Ernest P. Warner, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Feb. 24, 1890.

TELEPHONE AND TELEGRAPH APPARATUS.

544,335. Telephone-Switch. Frank R. Whitney, Lewiston, Me. Filed June 30, 1894.

544,341. Multiple-Switchboard System. Oro A. Bell, Brooklyn, N. Y., assignor to the Western Electric Company, Chicago, Ill. Filed Feb. 21, 1893.

544,345. Printing-Telegraph. Charles L Buckingham, New York, N. Y. Filed April 16, 1894.

544,346. Printing-Telegraph. Charles L. Buckingham, New York, and Emil Germann, Brooklyn, N. Y.; said Germann assignor to said Buckingham. Filed Jan. 10, 1895.

544,347. Printing-Telegraph. Charles L. Buckingham, New York, and Emil Germann, Brooklyn, N. Y.; said Germann assignor to said Buckingham. Filed Jan. 10, 189 .

544,348. Printing-Telegraph. Charles L. Buckingham, New York, and Emil Germann, Brooklyn N. Y.; said Germann assignor to said Buckingham. Filed May 20, 1895

544,369. Plug and Cord for Telephone-Switchboards Frank R. McBerty, Downer's Grove, assignor to the Western Electric Company, Chicago, Ill. Filed Sept. 18, 1894.

541,384. Single-Cord Grounded-Circuit System for Multiple Switchboard. Charles E. Scribner, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Dec. 1, 1 90.

541,385. Test-Signal for Multiple Switchboards. Charles E. Scribner, Chicago, Ill., assignor to the Western Electric Company, same place. Filed July 7, 1891.

544,386. Telephone-Switchboard Apparatus. Charles E. Scribner, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Dec. 28, 1894.

544,388. Telephone-Exchange System. Charles E. Scribner, Chicago, Ill, assignor to the Western Electric Company, same place. Filed May 13, 1892. Renewed Feb. 11, 1895.

544,545. Signal Apparatus for Telephone-Exchanges. Joseph J. O'Connell, Chicago, Ill., assignor, by mesne assignments, to the American Bell Telephone Company, Boston, Mass. Filed April 17, 1893.

5 4,546. Apparatus for Telephone Exchanges. Joseph J. O'Connell, Chicago, Ill., assignor, by mesne assignments, to the American Bell Telephone Company, Boston, Mass. Filed April 17, 1893.

544,644. Fountain Ink-Roller for Telegraph-Registers, Charles A. Rolfe, Chicago, Ill. Filed Oct. 13, 1894.

SIGNALS AND SIGNALING APPARATUS.

544,387. Electromagnetic Signal. Charles E. Scribner, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Jan. 8, 1895.

544,567. Electrical Signalling Apparatus. William W. Dean, St. Louis, Mo., assignor to the Bell Telephone Company of Missouri, same place. Filed Sept. 24, 1894.

MISCELLANEOUS.

544,158. Vessel for Electrolytic Separation. Wilhelm Borchers, Duisburg, Germany. Filed Dec. 31, 1894.

544,224. Electric Alarm-Lock for Tills. Charles Helm, Indianapolis, Ind. Filed April 23, 1895.

544,278. Electric Rheostat. Francis B. Badt, Chicago, Ill., assignor to the Siemens & Halske Electric Company of America, same place. Filed May 31, 1895.

544,332. Electromagnetic Damper for Measuring-Instruments. Ernest P. Warner, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Sept. 18, 1894.

544,,368. Strong-Current Arrester. Frank R. McBerty, Downer's Grove, assignor to the Western Electric Company, Chicago, Ill. Filed May 31, 1894.

514,372. Manufacture of Electric Cables. William R. Patterson, Chicago, Ill. assignor to the Western Electric Company, same place. Filed Aug. 24, 1891.

544,373. Art of Drying Electric Cables. William R. Patterson Chicago, and Charles H. Rudd, Evanston, assignors to the Western Electric Company, Chicago, Ill. Filed Sept 30, 1894.

544,374. Art of Drying Cores of Electric Cables William R. Patterson, Chicago, Ill., assignor to the Western Electric Company, same place. Filed April 18, 1892.

544,383. Electric Grounding-Switch. Charles E. Scribner, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Dec. 6, 1887.

544,430. Support for Electrical Batteries Used on Vehicles. Thomas Froggatt, London, England. Filed May 1, 1895.

514,486. Automatic Safety Appliance for Electric Conductors. Adelbert E. Hutchings, Detroit, Mich. Filed May 9 1893.

544,501. Cleat for Holding Electric Wires. Elisha W. Buffinton, Fall River, Mass., assignor of one-half to Albert F. Dow, same place. Filed March 15, 1895

544,514. Electric Gas-Lighter. Erik Or ing, Stockholm, Sweden, assignor to the Aktiebolaget Inventor, same place. Filed Feb. 5, 1895.

541,530. Apparatus for Insulating Wire. Tobias N. Hallanger, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Nov. 14, 1891.

544,531. Insulated Electric Conductor. Tobias N. Hallanger, Chicago, Ill., assignor to the Western Electric, Company, same place. Filed Feb. 18, 1893.

544,552. Electrotherapeutic Appliance. John E Wiles, Milwaukee, Wis. Filed Jan. 14, 1895.

544,610. Process of and Apparatus for Extracting Ores by Electrolysis. Edward W. Clark, Butte, Mont., assignor of two-thirds to Edwin M. Clark and the Western Iron Works, same place. Filed Nov. 5, 1894.

THE TELEPHONE WORLD.

The French Berliner Patents.

In view of the pending suit of the Bell Company against the National Telephone Manufacturing Company, alleging infringement of the Berliner patent, everything of an early date which may have a bearing upon the validity of the patent in suit is now of extreme interest. Among the earlier patents granted to Berliner himself are several French patents, which by their expiry have, as some suppose, invalidated the American patent bearing date of 1891, but applied for some fourteen years previously.

Below are given the specifications of these French patents which have been translated especially for our readers.

The first one bears date of January 8, 1880, and is French patent No. 134,481, for improvements in microphonic and telephonic apparatus, and reads as follows:

1. A microphone or contact telephone having no rubbing electric contact and having the electrodes maintained in contact with one another, with a variable pressure by the pressure exerted by a body moving or sliding freely by the action of gravity at an angle inclined to such contact, substantially as above set forth and for the purpose specified.

2. In a microphone or contact-telephone having no rubbing electric contact, the combination with a vibrating surface forming one electrode, of a pin forming the other electrode, and sliding freely on a suitable support inclined at an angle to the vibrating surface and connected to the battery in such a manner that its free movement on the support will not be interfered with, all substantially as above set forth and for the purpose specified.

3. In combination with a vibrating surface forming one electrode, the block A, provided with an opening or perforation inclined downwards to the vibrating surface, a conducting pin or cylinder having a carbon extremity and sliding freely in the said inclined opening so as to make contact at its extremity with the vibrating surface and a connection between said pin and the battery, which will not interfere with the free movement of the pin or cylinder, all substantially as above set forth and specified.

4. The combination of the diaphragm, the carbon block E, the damper H, the block A, the pin sliding freely in an inclined opening in the said block and the flexible conductor C.

5. A microphone or contact-telephone having only one contact affected by sound waves, and consisting of two electrodes in contact with one another, which contact is varied during its transmission of sounds by variation in the pressure upon such contact of a pendulous weight, which is kept out of its point of rest by the interposition of said electrodes and is supported in such a manner that there is no lateral movement or pressure between the electrodes.

6. In a microphone or contact-telephone, the combination of a vibrating surface forming one electrode, a pendulous weight forming the opposite electrode, with or without a device for changing the inclination of the same weight, and a band or ribbon of a flexible substance suspending the said weight, which band or ribbon may or not be a conductor.

7. In a microphone or contact-telephone, the combination of the flexible band O, or hinge, and the supporting strip L.

8. In a microphone or contact-telephone, the combination of the diaphragm, the carbon block E, the carbon tip b, the adjustable weight F, the plate I, the flexible band O, or hinge, and the supporting strip L, with or without the frame S and adjusting screw M 1.

9. In combination with a diaphragm of carbon or other material forming one electrode, the self-adjusting opposite electrode capable of sliding into contact with the diaphragm, and of being firmly fixed into position after having adjusted itself in said contact.

10. A damper for the diaphragms of microphones or contact telephones consisting of a ring of soft indiarubber or other elastic material held down upon the diaphragm by a screw passing through said ring.

11. The combination of a diaphragm of carbon or other material forming one electrode of the current with the opposite non-elastic electrode, capable of sliding freely toward the diaphragm until both electrodes come into contact with one another.

12. The combination of two opposite electrodes, one of which has its weight so regular as to exert pressure upon the other, and is capable of being firmly fixed into position.

13. The combination of two electrodes, one of which is fixed, and the other capable of sliding so as to exert by its weight a pressure upon the other, and capable of being fixed after regulating.

14. The combination of a diaphragm with a conducting block attached to it, the whole mounted upon a block provided with a perforation at right angles to the diaphragm, and combined furthermore with a movable electrode which, after contact with the diaphragm, may be maintained in place by the device shown in Fig. 12.

15. In a microphone or contact-telephone, an electrode suspended and maintained in place by a permanent magnet.

16. In a microphone or contact-telephone, the use of hardened carbon electrodes and their fabrication, as above set forth.

The second is an addition to the first and appears in the records as a certificate, dated July 1, 1880. It has the following claims:

1. In a microphone or contact-telephone the combination of a diaphragm, a damper formed of a flexible lever and a regulating screw resting upon the said diaphragm with two electrodes of variable contact placed between the tip of the said screw and the edge of the diaphragm.

2. In a microphone or contact-telephone the combination of a diaphragm forming one of the electrodes of the current with a suspended weight forming the opposite electrode, and with a device permitting the varying of the inclination of the suspended weight.

3. In a microphone or contact-telephone the combination of the diaphragm B, the carbon block P, the carbon piece b the weight F, the plate I, the flexible band or hinge O, bearing the plate N, the plate D and the regulating screw M.

The third, No. 159,049, dated December 8, 1883, contains the following claims:

1. A space or capacity containing a quantity of free particles or powder crossed by a current, and simultaneously compressed by a movable and variable weight applied to it.

2. The combination of the conducting powder M with the disk G, resting directly upon said powder and the disk E, perforated and covered with a platinum plate F, applied below the powder.

3. The combination of the parts described under 2, with the ring D and the conducting disk C.

4. The disposition mentioned under 3, combined with a weight in shape of disk G, provided with a handle, and with the speaking trumpet A, with a flexible tube.

The fourth, No. 160,930, of March 13, 1884, reads as follows:

I claim:

1. In a microphone where the variation of the contact pressure ordinarily takes place only at one point between the two poles of a galvanic current, the combination of two or several of these single contacts, through which pass simultaneously parts of the current of a battery.

2. The disposition of two or more single contact microphones upon the same diaphragm.

3. In a microphone, the combination of two or more pendulum contacts with pendulums of equal or different sizes and equal or different weights.

4. The dispositions of the claims under 1, 2, 3, or those of any of them, in combination with a diaphragm fastened to only one point of its circumference.

5. The disposition of the claims under 1, 2, 3, or those of any of them, in combination with a diaphragm suspended like a pendulum and adjusted by means of a movable screw, if so desired.

6. In combination with the claims under 4 or 5, the use of one or more springs or like accessories to regulate the vibration of the diaphragm.

7. The disposition of several microphonic contacts in pendulum shape upon the same rod, substantially as described above, and on the whole as represented in the four diagrams.

The last of importance is No. 174,835, of date March 17, 1886, and is intended to cover one form of the granular carbon transmitter. It reads thus:

My invention relates to that class of microphones or telephonic transmitters wherein a small quantity of conducting grains is enclosed in the electric current, and causes the latter to vary according to the number and the strength of the sonorous waves. I use in combination with that small quantity of conducting grains a vibratory plate, preferably of conducting carbon, as well as a piece of solid and conducting carbon which is sunk in the said grains. Furthermore, I make use of certain mechanical improvements, for the purpose of securing the best possible return.

The said improvements are as follows:

1. A bent, cone-shaped, sonorous funnel, of soft rubber or other similar elastic material.

2. A certain number of holes in the vibratory plate, which although too small to afford passage to the grains resting against the plate, allow nevertheless of a partial passage of the sonorous waves coming across the plate.

3. I enclose the said small quantity of grains in a chamber of a smaller diameter than the vibratory plate, and I provide that chamber with a soft protruding ring, which rests lightly like a cushion against the vibratory plate without being fastened to it.

4. I combine my apparatus with sliding bars enclosed in the circuit of the electric current, thus making it possible for the apparatus to be easily moved upward and downward for the convenience of different persons who may want to use it and moreover doing away with the use of flexible conductors for the electric current.

May Become One.

At the meeting of representatives of the telephone manufacturing companies interested in the organization of the Eastern Protective Association, which was held in New York on the 15th inst., no definite action was taken. There is a disposition to seek a union or amalgamation with the Western Association, and if there be no formal organization of the Eastern Association it is quite probable that the two associations will be resolved into one.

An agreement between the Citizens' Telephone Company, Pensacola, Fla., and the Southern Bell Telephone Company is being negotiated, whereby the members of the Citizens' Company will encourage the patronage of the Bell Company and discourage the establishment of any opposition for the term of five years, and suspend its efforts toward the construction of a telephone exchange in that city. As a consideration the Bell Company will reimburse the Citizens' Company for all money expended in securing its charter, and all other expenses, and return to each stockholder the full amount of money paid in; it also agrees to make a reduction of 10 per cent. from present rates to all telephone subscribers who will sign a contract to use the Bell Company's telephones for five years. This will make the net rates $36 and $27 per year. The Citizens' Company will not surrender its charter, but will keep it alive by annually electing officers.

The Blue Earth Valley Telephone Company, Blue Earth City, Minn., has secured local rights of way and will at once begin the construction of its plant. The line will be built from Elmore north, via all intervening villages, to a connection with the long distance telephones now in operation from Mankato to the Twin Cities, and will connect at Elmore with the Western Union electric system in Northern Iowa. A line connecting with the same will be built from Fairmont east to Wells, connecting all intervening villages in Faribault County.

A franchise has been granted to the Atlantic City Telephone and Telegraph Company, Atlantic City, N. J., conditioned upon free service in all city, fire and police departments and the payment of ½ per cent. of the gross receipts to the city.

The city council of Quincy, Ill., has granted a franchise to the Postal Telegraph Company. For the first year the company is to be free of tax; at the end of that time a special franchise tax of two per cent. on gross receipts is to be levied.

The new Standard Telephone Company of Baltimore, recently incorporated, is preparing to contract for the construction of a plant of 5,000 instruments, with facilities for an extension of an additional 5,000 'phones.

The Gratiot County Telephone Exchange Company expects to extend the line from Ithaca to Maple Rapids, Pompeii and other towns in Southern Michigan. A line to Alma and St. Louis is also projected.

J. B. Rice, of Sparta, and H. M. Fowle, of Tomah, Wis., will at once commence the construction of a telephone line from Sparta to Tomah, passing through Angelo, Lafayette and Tunnel City.

The Vermont Telephone and Telegraph Company, of Montpelier, Vt., organized in 18[illegible]8 under a special charter from the Legislature, has now nearly 2,000 miles of wire in use, with about 500 subscribers.

The Phœnix Telephone Exchange at Huntington, Ind., has been purchased by Charles F. S. Neal, Charles N. Zion and Philip Alder, of Lebanon, Ind.

W. D. Wilbur, John Troy, J. L. Daly and others, are interested in the establishment of a new exchange at Red Hook, N. Y.

F. A. Faxon, T. K. Hanna, W. F. Johnson and associates have applied for a telephone franchise at Kansas City, Mo.

A third line is being built by the Postal Telegraph Company between Philadelphia and New York.

Waycross, Ga., is to have a telephone exchange, work on which will begin as soon as a franchise has been secured.

ELECTRICITY.

VOL. IX. NEW YORK, AUGUST 28, 1895. No. 7

ELECTRICITY

Published every Wednesday by the
ELECTRICITY NEWSPAPER CO.
B. E. GREENE, PRES'T. L. J. MONTGOMERY, SEC'Y.

PUBLICATION OFFICE:
6 Park Place - New York

EDITORS: NELSON W. PERRY.
BURTON E. GREENE.
R. H. WILLOUGHBY.

BUSINESS MANAGER, - - JOHN L. GANS.

SUBSCRIPTION RATES:

UNITED STATES,	$2.50
IN CLUBS OF FIVE OR MORE,	$2.00
FOREIGN COUNTRIES,	$4.50
SINGLE COPIES,	10 CENTS

ADVERTISING RATES:

As ELECTRICITY reaches all classes interested in electrical work, its value as an advertising medium can be readily appreciated. Rates will be sent on application.

Changes for advertisements should reach the office not later than the Saturday preceding the date of publication.

ENTERED AT THE N. Y. POST OFFICE AS MAIL MATTER OF THE SECOND-CLASS.

EDITORIAL NOTES.

There are still left in this trade a large number of men who have entered into it for their life work. They may be disheartened, but they have not given up. It is for them that we write. To them we present our argument, and to them we must all look for the re-establishment of business principles, the reinforcement of the doctrines of common sense.

It is for these men to consider just why wrong has temporarily triumphed over right, why it was possible for the tricksters and adventurers to bring the industry to its present condition.

And when these questions receive careful thought the only answer possible is that the electrical press has not done its duty.

If the "Electrical Engineer," the "Electrical World," the "Electrical Review" and the "Western Electrician" had faithfully done their duty by the trade they claim to represent, whose best interests they claim to guard, the present situation would never have confronted us.—"ELECTRICITY," June 5, 1895.

The Forbes-Rowland Controversy.

The Editor of ELECTRICITY received some days ago the following letter from the Editor of our English contemporary, *Lightning:*

To the Editor of ELECTRICITY,
6 Park Place, New York.

DEAR SIR: Referring to the reference, in your issue of the 11th ult., to "Prof. Forbes's Serious Charge," I think it only right to draw your attention to the first paragraph on page 102 of our current issue (8th August), copy of which has been duly sent you. On page 104 of the same number, you will see a letter from Mr. Francis L. Stetson, vice-president of the Cataract Construction Company, and on the first page a letter from Prof. Silvanus P. Thompson on the advantages of alternating currents for transmission of power purposes. Yours faithfully,

THE EDITOR.

Office of *Lightning*, 117 Bishopsgate Street Within, London, E. C., August 8, 1895.

In due time there came to hand the issue of *Lightning* for August 8—the issue referred to—containing in addition to the letters of Mr. Francis L. Stetson and Prof. Silvanus P. Thompson the following editorial, to which reference was made:

It seems as though we were never to hear the last of the Rowland-Forbes dispute raised by the interview we published last February. We opened the last number of ELECTRICITY (U. S. A.) a day or two ago, and found Prof. Forbes's letter to *Lightning* of July 11 there quoted, with this astonishing comment:

PROF. FORBES'S SERIOUS CHARGE.

In the "reply" of Prof. Forbes to Prof. Rowland, printed on another page, the former says: "The officials of the Niagara Company have informed me and others that he (Rowland) was employed only to get him to withdraw his opposition to alternating currents." This is a serious charge, the truth or untruth of which is a far more important matter to the community than any other question at issue in this whole matter. We expect Prof. Rowland to take such action as men of repute do when grossly libelled. It is, even if untrue, a public confession that the Niagara Company does not hesitate to resort to bribery in the conduct of its business.

When we showed the cutting to the professor he said he could not understand what it meant. As it dawned upon him that he was supposed to have stated that Prof. Rowland had accepted a bribe to report contrary to his convictions, his face was a curious study of mingled amusement, disgust and amazement. His explanation after that was quite unnecessary, but lest any of our readers should have understood him in the same sense as did the editor of our Transatlantic contemporary, we give it here. The officials of the Niagara Company were satisfied that the alternating current was the best to use, and that any competent man who fairly considered the subject would come to that conclusion. They believed Prof. Rowland to be competent, but thought that his adverse report was owing to an insufficient consideration of the merits of the alternating system. If they did not again employ him, he might well never give the matter further thought, nor, if he did, was there any reason that he should acknowledge that he had been wrong.

But his opposition, that of a man reputed to be the first authority in the States on matters electrical, was calculated to injure the prospects of the company, and it was well worth while to pay for his education in the theory and history of alternate current work, and so secure the withdrawal of that opposition.

Replying to this, we must say that we fail to see wherein Prof. Forbes has bettered his case much. In the explanation credited to him he has used somewhat less blunt language than in the original charge, but the accusation remains essentially the same as it was before, viz., that Prof. Rowland was employed simply to neutralize his opposition to the use of the alternating current at Niagara. The language of the first statement implied in a brutal way that Prof Rowland's employment was offered as hush money; the language of the present conveys the idea that Prof. Forbes and the Niagara Company employed a less direct method, and instead of simply putting a few bills into Prof. Rowland's hands, undertook to *educate* him at their own expense up to their way of thinking. The sequel showed that when Prof. Rowland had been sufficiently "educated" according to their ideas they refused to pay the legitimate tuitional expenses, and the professor had to seek redress in the courts. We think that the latter is scarcely less heinous than the former. But of the two men involved in this dispute we are sure that all fair-minded men would rather be in the position of the accused than in that of the accuser. Prof. Rowland's position before the public to-day is certainly one of more dignity than that of his accuser, Prof. Forbes. Prof. Rowland needs no apologist. No one who knows him would for a moment suppose that his silence could be bought for any sum within the gift of either Prof. Forbes or the Niagara Company. That he should change his opinion as to the merits of the alternating current is not to his discredit, and is doubtless due quite as much to advances in the art as to any "education" which he received at the hands of either the Niagara Company or Prof. Forbes. It certainly *is* to the discredit of the other side, however, if it is true, as alleged by Prof. Forbes, that the Niagara Company deliberately planned a bribe, and it makes very little difference whether that bribe as planned took the form of a cash fee or the form of an "educational" course.

Prof. Forbes is an able engineer and as such is honored by all in the profession. His abilities, however, do not extend to that control of personal action and utterance that are usually ascribed to great men and necessary in a gentleman. He has been very unfortunate both in expression and action, and whatever the results of the Niagara scheme prove to be, his friends wi l ever regret the position in which he has unnecessarily placed himself.

Particularly in his attitude to American engineers has he been unfortunate. A connection which should have cemented more firmly the professional bonds between engineers in England and America has through the mighty egotism of this stranger to professional etiquette but loosened them.

In view of the fact that it was an American waterfall, that it was American capital and enterprise that rendered the scheme of development possible, and the other circumstances, it would have been a graceful courtesy on the part of Prof. Forbes, even though he considered that no one in this country was competent to criticize his plans, to have first described those plans to an audience of American engineers. He saw fit, however, not to do this. That American engineers did not openly resent this snub does not imply that they did not appreciate it, but rather that the exceedingly bad taste displayed reflected more eloquently upon the snubber than could any words from their own mouths.

Fortunately for England, Prof. Forbes does not stand as a type of the English gentleman either here or in his own country. It is a great pleasure for us to be able to say that an insinuation that he does would be as quickly resented by American engineers as it would be in England. His almost brutal attack on Prof. Rowland, while placing the Niagara Company in a very unpleasant light, can but react against its author; and on second thought it occurs to us that Prof. Rowland can do nothing so dignified as to continue the silence which he has thus far maintained. But it does seem to us that the officials of the Niagara Company who have been thus involved in Prof. Forbes's ill-considered charges should either make good his assertions or clear their skirts by an unequivocal disavowal.

Our contemporary, *Lightning*, by its reference to the letters of Prof. Thompson and Mr. Stetson, seems to imply a belief that we ourselves question the wisdom of the choice of the alternating current for the Niagara scheme. Nothing could be further from the fact. We did question at the time the wisdom of employing the low frequency of 8½, and it is now well known that the Westinghouse Company absolutely refused to bid on the specifications containing this requirement. The frequency of 25 was a compromise between what the Westinghouse engineers then thought was best and what Prof. Forbes wanted. It seems that subsequent experience has not changed the opinions of the Westinghouse Company, for Mr. Stillwell in his *Cassier's Magazine* article says: "At present the only practicable way to utilize Niagara power for lighting purposes is by substituting motors for the engines now used in arc and incandescent lighting plants. . . . When the demand for current to be used for lighting purposes becomes sufficiently important to justify a change in the apparatus, . . . a certain number of generators of *higher frequency* may be installed."

Bell Company vs. National Telephone Co.

The impression prevails in independent telephone circles that the issue at law of the American Bell Telephone Company vs. National Telephone Manufacturing Company is a collusive suit, entered into with the implied, if not direct understanding that the defence will not be made strong or vigorous enough to convince the court that the Berliner patent of 1891 is invalid, and that the injunction will issue as a matter of course.

Electricity hopes the impression may prove to be an erroneous one, but in chronicling the fact that such an impression prevails deems it no more than fair to state the facts which have given rise to the feeling now existing among telephone manufacturers.

Ever since the decision reversing the finding of Judge Carpenter was handed down by the United States Circuit Court of Appeals, every independent telephone manufacturer in the field has been expecting such a suit as has recently been instituted by the Bell Company against the National Company. The telephone manufacturers realized quite as early as did the Bell Company the great importance of the rehabilitated Berliner patent. They know that if the Bell Company is able to maintain the validity of this patent the microphone transmitter will remain in the clutches of monopoly for thirteen years to come. They know, too, that if the opportunity is offered it can be demonstrated beyond all reasonable doubt that Judge Carpenter was right when he said: "The patent is void and shall be delivered up to be cancelled."

The independent telephone manufacturers have not gone into the business blindly. The majority of them are experienced in practical telephony; they are posted on patents and the practices and methods of the Bell Company, and have long been anxious and willing to have that company throw down the gauntlet. It is therefore to be expected that when issue is invited on a patent of doubtful validity these manufacturers would very much desire to obtain as full information as possible concerning the suit.

The papers in the National suit were served on August 6. As soon as the fact became known, the telephone manufacturers, and others interested in the development of the promising new industry, besieged the National Company with requests for information.

The following letter, written by Mr. J. D. Leatherbee, treasurer of the National Company, and received at this office, contained about as much information as any of the inquirers has been able to obtain:

> The undersigned gave to the Associated Press an outline of the whole matter to which you refer. It is a fact that the Bell Company has sued us, and that we shall contest the suit.

The information given to the Associated Press embraced nothing more than a brief statement of the fact that suit for alleged infringement of the Berliner patent had been brought. Almost simultaneously with the requests for information came offers of assistance from many of the leading telephone companies who were anxious to be made co-defendants in a suit the outcome of which is of vital importance to the independent telephone business. These offers have likewise been declined. Urgent requests to have the National Company identify itself with either or both of the Telephone Protective Associations have met with no encouragement, the officials of the company declaring it to be their intention to fight its battles unassisted.

A knowledge of these facts, and possibly others, coupled with a realization of the inequality of the contestants in this legal battle, is responsible for the lack of faith in the defence to be offered in the suit.

It should be borne in mind, though, that the Bell vs. National contest will be watched by the best legal talent that can be employed by the individual and associated interests of the independent telephone trades, as well as by Electricity. Should any evidence of collusion develop, the consequences will be remembered longest by those having the most to do with it.

Notwithstanding the persistence with which information as to the scope and character of the suit has been denied to those desiring to acquire the same, Electricity is able, in the current issue, to present to its readers the first publication of the full text of the bill of complaint.

* * *

The French Berliner Patents.

We printed in last week's issue translations of five of the earlier microphone transmitter patents granted to Emil Berliner in France, which it seems are relied upon somewhat by the opponents of the Bell Company to invalidate the American patent granted to the same inventor in 1891, declared invalid by Judge Carpenter and rehabilitated by the United States Circuit Court of Appeals.

It will be seen that all of these are strictly detail or species patents and are limited to specific methods of accomplishing what is broadly claimed in the American patent of 1891. Recurring to the latter, we find that it claims to cover "the method of producing in a circuit electrical undulations similar in form to sound waves by causing *the sound waves to vary the pressure between electrodes in constant contact* so as to strengthen and weaken the contact and thereby increase and diminish the resistance of the circuit."

The hope of the defence so far as these particular patents are concerned is based on the Bate decision, which settled once for all the question as to the limitation of an American patent by the expiry of the *same* foreign patent granted to the *same* inventor prior to the granting of the American patent. Just how broadly this principle will be interpreted by the courts remains to be seen. As already shown in these columns (p. 261, May 29,) there is another question involved, which has not yet been authoritatively settled, and that is the effect of a foreign patent granted to another person, or of a foreign *species* patent (which those under discussion undoubtedly are) granted to the same or another person before an American *genus* patent (which the American 1891 patent certainly is).

There seems to be some difference of opinion on this question among those whose opinions are entitled to respect, but the preponderance of opinion is that unless the foreign patent previously granted is for the same thing substantially, the American patent is *not* limited by the foreign patent, and that a foreign *species* patent does not limit by its earlier expiry an American genus patent, even though the two be granted to the same inventor. There, however, seem to be grounds for doubt in this case, for the courts, so far as they have expressed themselves, have differed. As already pointed out, in Commercial Canning Company vs. Fairbanks Canning Company, where this question was involved, the Court leaned to the view that a foreign species patent did limit an American genus patent when granted and expiring before the latter; yet the opinion on this point was not expressed with that clearness and decisiveness that are desired in a controverted question.

In the Government suit for the annulment of the Berliner patent a British species patent granted to Lake (Berliner's agent) in 1880 and expiring in 1894, was held by Judge Carpenter to limit the American patent. Other decisions could be cited where the opposite view was held by the Court, so that until the question is brought to a court of last resort it will remain an unsettled one. In the United States Circuit Court of Appeals, where it was hoped that an authoritative construction would be placed upon this question, it will be remembered that it was not considered at all, and that the Berliner patent was merely reinstated in the same position as that of any other patent issued from the Patent Office. The Berliner patent, therefore, starts out anew and without prejudice, and its validity must be maintained in the courts in the same way as that of any other patent. All previous litigation in regard to it practically goes for naught.

As regards the question as to the effect of the expiry of a foreign species patent upon an American genus patent it is difficult for us to understand how, where there is no question as to the character of the two patents—where there is no question that one is a species patent and the other a genus patent—there can be any question as to the ultimate answer.

Where an individual makes an invention, he aims to cover it as broadly as possible in his first patent, and then in subsequent patents to cover the specific means to the desired end. It certainly does not seem just that when an inventor has given to the world a new art, for instance, that he should jeopardize his rights by subsequent more specific patents which tend to increase the usefulness of that art, and we do not believe that this idea has ever been upheld by the courts. On the other hand it is a recognized principle in patent law that an *improvement* cannot dominate the thing improved. We need only cite the original Bell telephone patent as an illustration. It was for a method of transmitting articulate speech *by means of undulatory* electrical currents. In the earlier litigation it was once held by the opponents of the patent that it was invalid because it constituted a monopoly of the art. The reply of the Bell Company was, that if this were true it was but accidentally true, for Bell had merely patented one general or specific method, viz., by means of *undulatory* electrical currents, and that he was thereby limited to that method, all other methods were open to the public, and if the defence, or any one else, could find another method of transmitting articulate speech, they were welcome to it, and could use it without infringement. Now, subsequent to Bell's discovery some one else (let us say Berliner) discovered a new way by which sound waves could be translated into these undulatory currents of electricity. This method, in the language of the patent, was "by causing the same waves to vary the pressure between electrodes in constant contact." Assuming this patent to have been obtained by prescribed methods, in full conformance with the law, it was a good and valid patent, yet it was subservient to the fundamental Bell patent, and could not in any way limit the latter. Berliner by reason of his patent was not entitled to make and use telephones because the earlier patent of Bell's covered the very thing which made Berliner's device useful. Berliner's device was merely an improved method, or another method of accomplishing that which Bell had previously accomplished. Nor can it be successfully held, we think, that Berliner's patent is invalid by reason of its covering a principle. As with Bell, he patented a specific method for translating sound waves into similar undulatory waves of electricity. While this method happens to be one of the most convenient ones at present known, it is by no means the only method. Bell's original method is one, and there are various others; so that if the early Bell patent, which though specific and limited to a single method practically covered the art of telephony, was held to be valid against this argument, there can be little hope that the Berliner method, which is by no means so exclusive, can be adjudged invalid for the same reason.

We are among those who believe that the extension of the Berliner patent is in direct subversion of the intent of the patent laws and of public policy, and believe that if the defence in the suit against the National Company is conducted honestly and with ability it will be so declared. We look upon the conduct of the Government's recent case in annulment as having been almost insanely bungling, and trust that the case of the public in the present instance will not be the disgrace to the legal profession that the former one was.

Under the Searchlight.

Views and Opinions on Timely Topics.

"*As a voltage of* 10,000 *has proved to be entirely practicable, a territory within a circle of* 100 *miles diameter can be as easily served from a central point as can one town from its own plant employing the usual voltage.*"—Electrical World.

* * *

WE receive an occasional letter reminding us that Mr. H. M. Byllesby is no longer a factor in the electrical business, and raising the question whether it is good newspaper judgment to criticise him so severely. Some of our correspondents ask the question, What is the grudge which ELECTRICITY has against Mr. Byllesby? We have no grudge whatever against Byllesby, but an undying grudge against the wrong which Mr. Byllesby did in his capacity as agent for Charles A. Coffin in the Northwest swindle. Moreover, we do not see why any sympathy should be wasted on Mr. Byllesby. It is susceptible of proof that during his last year with the Westinghouse Company, from which he drew a high salary, he also received pay directly from Mr. Charles A. Coffin.

It will be remembered that at the historic annual meeting of the Westinghouse Company, held in Philadelphia, Mr. Byllesby had secured proxies on a large proportion of the stock, and then voted the stock to depose Mr. Geo. Westinghouse from the presidency.

There are also on record various other transactions of Mr. Byllesby, such as taking good collateral to the amount of $200,000 and putting it up with a bank for a $25,000 loan, the object being, of course, to cripple the Westinghouse Company as fast as possible.

If there is anything in Mr. Byllesby to entitle him to sympathy we do not know of it. He distinguished himself as one of the most proficient graduates in the school of crime conducted in Boston by Mr. Charles A. Coffin, and the records of the Northwest Company, now in our possession, furnish abundant grounds for an indictment of both Byllesby and Coffin in the courts of the State of Minnesota.

* * *

IN a letter directed to Mr. H. M. Byllesby by Mr. C. A. Coffin, a copy of which is before us, we find the following sentence: "I consider it a fair rule of business that the investor in our securities is entitled to a *fair share* of the profits of the enterprise." Who was to get the other share?

* * *

WE do not wish to question the good faith of the preferred stockholders of the Northwest Company who are in the movement to make Mr. Coffin disgorge, but we do question their judgment. Why not have a receiver appointed, in three States if necessary, and compel the production of the official records—those at least which are not now in the office of ELECTRICITY. No courts or receivers can get our originals. The whole world, however, can read ELECTRICITY, which will publish all the leading and pertinent facts.

* * *

How would Mr. Coffin like to explain in court his connection with the Butte General Electric deal? Has the firm of Byllesby & Levis been dissolved?

* * *

NEXT WEEK we shall resume the publication of original documents in connection with the Northwest G. E. articles. Our archives contain a complete record of the company from the original contract between Gilman and Coffin in 1888 down to the time when Mr. Byllesby was deposed from the presidency at an adjourned meeting in Schenectady and Mr. Howard Levis appointed in his stead. All financial statements, lists of stockholders, private reports of Gilman and Byllesby to Coffin, records of local plants, Coffin's letters of instruction, photographs of notes, checks, etc., are at hand, and will be printed from week to week.

NOTES OF A WESTERN TRIP.

The Field of One of the Thomson-Houston Financing Schemes Visited by a Staff Correspondent.

Among the banks used by Mr. Coffin to carry the Northwest enterprise along was the Euclid Avenue Bank of Cleveland, of which Mr. Charles F. Brush had been president. On August 29, 1893, the Northwest General Electric Company had on deposit at this bank $3,658.81, and had discounts from the bank amounting to $99,367.50.

The well posted electrical fraternity in Cleveland are considerably interested in the developments in the McIntyre matter at Philadelphia. The People's Traction Company bought 125 Sperry equipments, and at the time nobody could see just why. I understand that Mr. B. F. Miles, of the National Carbon Company, formerly an officer of the Sperry Company, is anxious that the entire truth be told.

Throughout the West and Northwest there is a universal feeling of jubilation. Crops of all kinds were never better, prices are fair, and the farmers will soon again have money to spend. They have had very little, as we all know, for two years. The great grain fields of the Dakotas were all harvested two weeks ago, and the crop is now safe. In Western Minnesota potato growers are taking in from 200 to 250 bushels to the acre.

One of the attendants at the Edisonian Convention at Detroit unmentioned in last week's report was Mr. Scott Hayes, who is, temporarily we hope, out of the electrical business.

Standing on the corner in front of the Great Northern Hotel in Chicago one evening I was accosted by twelve beggars in just ten minutes nearly every one of them able-bodied men. On leaving the depot at St. Paul almost the first thing to be noticed were the signs of the agencies proclaiming the want of help in the country all the way from St. Paul to the Coast. Hundreds of men were needed, and the wages offered were from $1.25 per day and board to $1.75 per day without board, with either free transportation or a very low rate.

The general feeling in Chicago over business prospects is better than at any time since 1893. The larger companies are busy now, and all the hustlers are ready to make their best efforts this fall.

There will be a general feeling of regret that the Appleton, Wis., Edison Company is being wound up by a receiver. This was the first Edison station in the world; a railway plant was also added. This was also a historic plant, being one of the earliest Van Depoele operations, the motors being mounted on the platforms of the cars. The station was run by water power, the further use of which was recently forbidden by the Secretary of War. Simultaneously a competing plant was hustling for business, and the old concern is ruined. Mr. A. L. Smith, one of the original promoters, was appointed receiver. There are $150,000 of bonds on the plant. While the company was in the worst of its troubles in regard to power, the General Electric Company garnisheed its revenues for July through the firm of Kurles, Spence & Kurles, of Milwaukee. The Appleton Company were trying to sell arc lights at $50 per year per lamp. Mr. Ord's instructions to the receiver are to sell the plant at once for whatever it will bring. He says, "What we want is cash." The company has a floating debt of $111,000, chiefly to the General Electric. By the way, I wonder if John I. Beggs, John Muir, and J. P. Ord have ever explained what became of the $6,000 paid to Mr. Beggs on the Appleton deal?

At Winona I found the street railway system in just about the condition I expected. Cars are no longer run on Sundays, the equipment is worn out and must soon find a resting-place in the junk shop.

At a ball game in Chicago I met Mr. Russell B. Harrison, who has made as thorough a study of street railway matters as his father has of politics—and this is saying a good deal.

At Oshkosh I went over the proposed route of a great interurban system connecting that city with Neenah, Menasha, Kaukauna and Appleton. I shall take pleasure in an early article in showing the foundation upon which the millions of securities of this system rest. The manufacture of bonds is not yet an obsolete branch of the railway business.

I was unable to meet Mr. T. A. G. Moe, who was so busy he was hard to locate. In addition to his duties as motorman on the St. Paul and White Bear Lake Railway, he is now burdened with the management of the system, having been appointed receiver.

One of the celebrities I met in St. Paul was Col. W. C. Plummer, whose mellifluous voice has been heard in Republican conventions in State and National affairs for a quarter of a century. Col. Plummer left Western Pennsylvania about 1880, and, of course, made his mark in the Northwest. He has been a politician and a rattling good newspaper man for so many years that nobody remembers just how long. He is taking a vacation this summer in St. Paul, and constructing language which he will hurl against his Democratic opponents in the Dakotas this fall when they venture to argue that the glorious yield of crops has been caused by a Democratic Administration. The Colonel's title has been changed since his removal to the West. In Pennsylvania he was called "Parson" Plummer. One time when he was on the Titusville *Herald* a printer died, and being a member of the Typographical Union and a communicant in the Roman Catholic Church, his priest refused to perform the burial service. Plummer volunteered to take the place of the clergyman. I recalled this incident to him, and he laughed heartily as he related that, after exhausting all his oratorical abilities to strike a sympathetic chord in the audience at the funeral, he was likely to fail entirely. But when the coffin was being lowered into the grave he said in pathetic tones, "Poor Jim Brady, he will never set any more bourgeois at thirty cents a thousand." At this the widow shed tears, and the assembled printers joined in the general chorus of grief.

The proprietors of the Depot Hotel at La Crosse, Wis., deserve a substantial memorial from the traveling public for the quality of meals which they serve. Few hotels in the country have better service, and no other railroad restaurant is to be mentioned in the same breath.

On the train from Chicago to St. Paul I met Jerry Coughlin, who has been a conductor on the Chicago, Milwaukee and St. Paul system for twenty-five years. He is now president of the Irish-American Bank in Minneapolis, and is reputed to be worth $250,000. I did not ask him where he got it. His salary is $1,200 a year.

Notwithstanding all the rumors to the contrary, I found things running very much the same at Butte. The faro and roulette tables have been taken in from the sidewalks, but the doors of the gambling establishments are still wide open, and the places are well patronized for 24 hours a day. We take it that the old-timers who visit Butte must imagine themselves back in the forties or fifties. The fine business blocks, of which there are quite a number, have been scattered among the mining shafts, and the town presents a strange composite picture. Most of the mining and smelting establishments run 24 hours a day, working three shifts of men of eight hours each. This furnishes activity for the gambling houses and saloons almost continuously.

The Butte General Electric Company gets $2.50 per month for a 16 candle power lamp, which seems high, but inasmuch as the plant is bonded for a half million dollars, and there are less than 20,000 people in Butte, including the floating population, it is not difficult to see where this enterprise must end.

The superficial observer would say that the street railway system of the Twin Cities is a veritable gold mine for the owners. It no doubt has been a gold mine for the promoters. When we reflect that in a community of 300,000 people this system has out about $27,000,000 of securities, the thoughtful man must wonder where the investor is coming out, even if the cars were running full for fifteen hours a day. However, one thing I noticed on the cars of the system is to be commended; it was an automatic attachment for closing gates and raising the platforms just before the car starts. The platform is dropped and the gates opened again instantly upon stopping the car. This is a device which ought to be universally adopted in all large cities.

After all the rubbish which has been heard and printed in the East during the last year or two in regard to the substitution of electricity for mules on the Erie Canal, and the expected improvement in canal service thereby, it was refreshing to note the sensible views on the canal question held by a majority of people in the Northwest—people who will be equally benefited with New York State in the ultimate solution of the great canal problem. There is very little talk heard in that section about electricity or any other make-shifts. What they want is a deep water passage-way to the seaboard, and they know that without that the canal problem will never be solved.

I met in St. Paul a former acquaintance, whose name I will not mention. He had been in Wall Street up to 1890, and while he had considerable money left he felt that the speculative fever was getting too strong within him and he moved to St. Paul to get away from it. He says he jumped from the frying-pan into the fire, and that the first venture he went into in St. Paul was a speculative one, in which he lost about half his fortune. He is now settled down, however, in a conservative business, and is looked upon as one of the leading financiers of the Twin Cities.

GEN. A. M. STOUT.

Gen. Alexander M. Stout, one of whose sons, Stanley S. Stout, is quite prominent just now in pending telephone litigation, died August 25, at the Presbyterian Hospital, Chicago. He was a native of Kentucky, and on the breaking out of the civil war raised the First Regiment of Home Guards of that State and subsequently raised and commanded the Seventeenth Kentucky Regiment. He took part in every battle in which his regiment was engaged, and received from his fellow officers a jeweled sword inscribed "For gallantry at Chickamauga."

After the war, Gen. Stout attempted to practise law at Louisville, but sentiment was so strong against him as a Union soldier that he found himself almost an alien in his native State. He became Acting Commissioner of Patents at Washington, and afterward practised law there until 1879, when he removed to Chicago.

THE NIAGARA PLANT AT WORK.

A dispatch from Niagara Falls states that on the 26th inst. the Cataract Construction Company for the first time put its machinery in operation for commercial purposes. On that day the 5,000 horse power Westinghouse dynamo (No. 2 was set in motion and the electric current generated by the mammoth machine was transmitted over an underground cable about a mile long to the aluminum works of the Pittsburg Reduction Company. Everything worked to the satisfaction of all who witnessed the significant event.

"Now that *American* engineers have utilized the Falls of Niagara for commercial purposes," etc., etc. So runs a paragraph in the *Hekker*, but Prof. Forbes will no doubt be astonished to learn that he is a Yankee, in spite of the fact that he pronounces Niagara as if it were Nee-a-gahra.

Apropos of Prof. Forbes and Nee-a-gahra, the self-advertising correspondence in the *Times* appears to have petered out. We were much amused at the egotism of the first letter of the series from the Professor. "*I* have received reports," "When *I* designed the 5,000 H. P. dynamos," "When *I* settled upon the machines," "*I* took upon myself a great responsibility," "*I* selected as manufacturers the General Electric Company," "Matters which *I* had to arrange for," "When *I* decided upon alternating currents," "When *I* adopted low frequency," and "*I* have been confirmed." There are so many I's about that it seems to us that Prof. Forbes must be the lineal descendant of Argus.—*Electricity* (London).

General Electric's Financing Policy.

Northwest General Electric—The Scheme, the Companies Financed, the Facts and Figures from the Official Record.

How Bonds are Manufactured for New England Investors.

CHAPTER VII.

The Plan of Establishing Local Electric Light Plants and Forming and Conducting Local Electric Companies Founded on Them.

In treating of the methods employed in establishing local electric lighting plants, and in forming companies to take them over and operate them, we shall at present confine our attention mainly to the operations in the Northwest connected with plants installed by the Northwest Electric Construction Company, the predecessor and progenitor of the Northwest Thomson-Houston Electric Company, and by the Northwest Thomson-Houston Electric Company and its successor, the Northwest General Electric Company. Subsequently we shall follow this discussion by a series of articles on the history of these three Northwest sub-companies, giving the details of their origin, conduct and of the financial transactions in which they engaged, and of the final utter collapse of the whole swindling scheme. In this series we shall show how thoroughly alike were the expedients for raising money employed by these companies and those used by the parent Thomson-Houston Electric Company, and *prove* that the resources of the sub and parent companies were identical and of the same worthless or shattered character, and will satisfy everyone that the means and methods employed in availing themselves of the use of these worthless or shattered resources to prolong their iniquitous existence were in all of these companies of exactly the same kind.

Still later we propose to deal with the whole general plan followed in building up the Thomson-Houston Electric Company's *factitious* and *fictitious* business; and show how and to what extent the many trust, fiduciary, banking, mortgage and loan and securities companies of this country were dragged into this scheme, and exactly *how* a very large number of electric properties of this country have been financed by the management of the Thomson-Houston Electric Company. In these articles we shall trace the origin and evolution of that company, and demonstrate by numerous examples taken from its actual career just how that company became the buccaneer, filibuster, pirate and debaucher of the entire electrical industry of this country, giving in detail the various means resorted to in the conduct of its business and the schemes devised and carried out with the express intention of fleecing the public and of endeavoring to force all other concerns to the brink of ruin, and to secure complete control of the industry.

Some of our readers may be prone to exclaim that this is all ancient history and of no present value or interest. They may admit that it may all be true, but claim that to discuss the matter *now* serves no useful purpose, and that the doings of the past cannot be accepted as an index of the methods at present in vogue, or be of any service in deciding upon what may be expected in the future. To them we reply that we will show that though the methods now used have doubtless been in some particulars changed by reason of force of circumstances and pressure brought to bear on the management of the General Electric Company (neither of which they have the power to effectually resist); it is nevertheless true that the general object and intentions of the management of that company are still the same as those which influenced the management of the Thomson-Houston Electric Company, and furthermore, the older and the more recent methods are substantially the same in effect.

But a moment's careful consideration of the subject ought to lead anyone to clearly perceive that these matters are not affairs of ancient history, but are of the utmost *present importance*, and of vital and immediate interest to all concerned in the prosecution of the business and conservation of the industry, and are also of the greatest moment to the trustees of estates, trust, mortgage and loan companies, fiduciary and banking institutions, widows and orphans, and investors generally. For is it not a fact that there is still in existence an enormous amount of these worthless or practically worthless so-called electric securities, and that efforts are constantly being made to dispose of them to the public through various financial institutions and also by companies expressly organized to float them? Furthermore, is it not absolutely true that the Thomson-Houston Electric Company's main source of strength, its power to set at naught the vested patent and business rights of others, and its ability to injure all those legitimately engaged in the industry, and to wrest from its competitors business not equitably belonging to it, rested not on any real, material or substantial originality in or superiority of the machinery, apparatus and appliances made and furnished by that company, or on legitimate superior business ability of its managers, or on the ingenuity, originality and skill of its inventors, designers and engineers, but rather on the capacity of its managers to raise vast sums of money almost entirely by the means and methods we have already portrayed, and which we shall much more completely delineate in the future?

Are not all the statements in the preceding question also true of the General Electric Company? The management of the General Electric Company is to all intents and purposes the *same* as that of the Thomson-Houston Electric Company. Is it possible to suppose that there has been such a change of heart as insures its complete conversion and the entire abandonment of its former iniquitous ways and methods? Are we to assume that the principles, or rather absolute want of principles, which characterized that management's former course have been essentially modified, and that its future career will be marked by an earnest desire to conscientiously abstain from all further attempts to wipe out by foul means honest competition, and to forever forswear the practice of chicanery, stock-jobbery, deception and fraud, and in the future strive to cultivate a spirit of justice and fairness to all competitors and good-will toward and sincere interest in the welfare of the users of electrical apparatus?

Are the many station managers of this country, who only a short time ago were threatened with complete destruction by the schemes worked by that management to induce the municipalities in which they operated to enter into the business as competitors, or by the inducements offered to gas companies to enter as competitors the very fields which their own licensees occupied and for which they had paid the Thomson-Houston Company and its allies so much money, to be deluded into believing that the management of the General Electric Company has completely changed its policy, and if so, that it has been done voluntarily and permanently?

Have the station men forgotten, or are they likely soon to forget, how the allied companies of the Thomson-Houston Electric Company were used (by the very same management as now directs the affairs of the General Electric Company) to harass, distress and render wholly unprofitable, and in many cases threaten with total destruction, the business which many of them had been induced to enter by the plausible stories of the prospective, and said to be certain, very large profits of the electric lighting business, ingeniously worked out and spread before them by the carefully coached agents and accomplices of this very same management?

Have the stockholders and managers of many of the local electric lighting companies in this country had obliterated from their memories all recollection of just how these allied companies of the Thomson-Houston Electric Company were instigated to enter the territory of which they had good and just and full legal grounds to believe they were the exclusive owners, by reason of the fact that they had previously purchased from the parent Thomson-Houston Electric Company, at exceedingly high prices, the apparatus, machinery and appliances used by them in the prosecution of their business, and had obtained full and exclusive license to its use in that territory; and that said allied companies in many cases used apparatus which to all intents and purposes was the same as that which they undoubtedly had full, legal, exclusive right to use, and how such infringing apparatus was sold to their competitors at a fraction of the cost which the pioneer company had paid?

Do the station men of this country fail to remember how these allied companies were further used to intimidate, browbeat or cajole their executive officers and stockholders into deals for the purchase of their apparatus, or into combinations with other companies using that apparatus in their territory in direct violation of the rights secured to them under the contracts with the controlling company?

Do the pioneer station men not recall the many terrible struggles for maintaining a bare existence, due largely to the defectively designed and badly constructed apparatus, which was in many cases wholly inadequate to stand the strains or incapable of meeting the requirements of practical use; and, further, how they were mulcted and bilked by the parent companies by grossly unjust and outrageously excessive charges for repairs to and renewals of parts of that apparatus to such an extent as to render it absolutely impossible in many cases to meet even their running expenses?

The time is not far distant since this same management had skilfully drawn and most carefully worded forms of contract, presented to and intended to bind the station men of this country hand and foot, to purchase from them, and them only, for a long period of time, such machinery, apparatus and supplies as they needed in the conduct of their business—whether or not that machinery, apparatus and supplies were equal or vastly inferior to that made by competing concerns. And if they did not accede to these conditions what might they be led to expect at the hands of the management of a 60,000,000-dollar parent company!

We believe that the dangerous fangs of that management may possibly be temporarily sheathed, but not destroyed, and there is no certainty but that, by some *new alliance*, the dangers threatening the station men of this country will be re-developed and appear with even greater virulence than ever.

If the dangers referred to, and unquestionably previously threatening all the station men and independent manufacturers of this country, have temporarily passed, it is only because of the inability of the managers of the General Electric Company to *raise the money* with which to pursue and carry out the course they had undoubtedly mapped out.

Full exposure of the rascally methods employed in the conduct of the business by the parent or manufacturing companies is the only real safeguard against the reappearance of these dangers; because it, and it only, will prevent them raising any large amount of money by illegitimate schemes, and moreover it forces them into a position in which they are compelled either to conduct their business as manufacturers of other appliances do, and depend for revenue on returns from actual sales, or it will force them out of the business; or, what is more likely, when the business reaches this condition, they, being no longer able to make money in it by their methods, will therefore desert it and turn their attention to other fields, in which their peculiar methods stand a better chance of yielding the kind of success they strive for. Hence we believe it our duty to the station men, independent manufacturers and others engaged in the equitable conduct of the various branches of the industry to continue the warfare on, and fully expose, the methods employed by these schemers; and we are firmly convinced that at some not far distant time the best men in the enterprise will recognize and concede that we have done a really valuable service to the trade at large.

In 1894 Mr. C. A. Coffin used the following significant language in his second annual report to the stockholders of the General Electric Company:

"The Edison Company to a small extent and the Thomson-Houston Company (the organization of which was mainly adopted by your company) to a greater extent had been in the habit of doing more or less exploiting work, resulting in the acquisition of stocks and bonds of local lighting and railway companies. The Thomson-Houston Company had generally been very successful in marketing these securities at profitable figures. By the facilities which it had thus been able to afford local enterprises it was enabled to expand its business. Your company at the time of its organization assumed a large number of such transactions which were in progress or contracted for. The general policy of your board, however, since the organization of your company, has been to curtail transactions involving the acceptance of stocks or bonds for anything other than license rights, except where for some special reason it has been deemed advisable to accept them, as in settlement of disputed or doubtful accounts.

"Among the most important transactions of the character above referred to were those with newly organized companies, and this class of business had been very extensive in the South and West. The financial and industrial collapse in these sections in the spring and summer of 1893 affected your company very severely, and very many accounts, notes and investments assumed as good a year ago must now be recognized as of diminished value. The same is especially true as to the Northwest, where your company's output was sold through the Northwest General Electric Company, formerly known as the Northwest Thomson-Houston Company."

The guarded admission thus made of the fact that the Edison Company to a *small extent* and the Thomson-Houston Company to a *greater extent* had been in the habit of doing more or less *exploiting work*, resulting in the acquisition of stocks and bonds, is of considerable importance in connection with the subject in hand. But it would have been nearer the truth to have stated that the principal, and indeed by far the larger part, of the Thomson-Houston Company's business was composed of what Mr. Coffin has chosen to term "exploiting work" rather than to designate it by its true name. Indeed, for years and (if strict regard be paid to the naked truth) ever since shortly after the organization of that company, it had mainly devoted its energies to doing an utterly illegitimate business in this so-called "exploiting work;" and in a thoroughly unsafe, unjust and iniquitous way it had indeed been "enabled to expand its business" and thus create an actually *false* and fabulous demand for its electrical apparatus for the purposes of stock-jobbery and fraud, and with the further intention, by resorting to these methods, of working the ruin of every other company or concern in the field, by making it practically impossible for them to sell their apparatus in competition with the Thomson-Houston Electric Company unless the managers of these competing concerns were also willing to adopt the same unsafe, vicious and nefarious policy and means of doing business, and to do so to the same or even a greater extent than did the management of the Thomson-Houston Electric Company.

We find ourselves greatly tempted at this time to go into a most detailed analysis of the statements made by Mr. Coffin in the language quoted from his second annual report to the stockholders of the General Electric Company, and other language used by him in that report and doubtless intended to convey the impression to their minds that *he* was *ignorant* of the actual condition of the properties referred to by him and of the condition of the Northwest Company, and was consequently blameless for their condition and conduct, and to compare these statements with the actual facts. It is, however, better to defer this analysis of his statements and a comparison of them with the facts until we have shown the actual condition of the properties and of the Northwest Company and the methods employed in the conduct of this latter named company.

The cases we discuss in the present series of articles will show how this "exploiting work" was done and upon what sort of a foundation these "local enterprises" were laid and by which the Thomson-Houston Company "was enabled to expand its business."

At the head office of the parent Thomson-Houston Electric Company, and at its sub or district offices, and at the offices of its associated or trading companies, there were a large number of men employed whose principal or sole duty it was to visit the various cities, towns or villages in their respective districts for the purpose of selling plants or endeavoring to erect stations and install local plants, or organize companies to do so, from which local plants electricity was to be publicly supplied for lighting, power and heating purposes.

Whenever a city, town or village was found without a local station for supplying electricity, or, for that matter, already had one in operation, and from which light or power was supplied by any other system or systems than the so-called Thomson-Houston systems, these men were authorized to take all necessary steps and incur whatever expense might be involved in securing a franchise from the municipal or village government, permitting them to establish, erect and maintain the necessary buildings and machinery, erect poles, posts, lamps, line wires, etc., required for the equipment and operation of a plant for the distribution of electricity to be used for the purposes of "illumination, heat and power."

Whenever any other company operating a different system did not already occupy the territory which was to be the field of operation, and whenever it was practicable, the franchise sought to be secured was to be an exclusive one, and was to be obtained for as long a period of time as it was possible to *induce* the city, town or village authorities to grant it. In addition to the franchise these agents, promoters or exploiters were instructed to also *induce* the municipal or village governments to sign an exclusive contract for the furnishing of a certain number (and as many as possible) of arc or incandescent lights, or both, for lighting the streets or roads of the city, town or village, and for as long a time as they could, and at such prices as circumstances determined or policy made necessary.

How the city, town or village authorities were in some cases *induced* to give such franchises and enter into such contracts will appear later.

In a very large number of cases these agents, promoters or exploiters secured the franchises, contracts and rights in their own names, and were expected, at the proper time, to transfer them either to the parent company or to the sub-parent company, or to the local company which was to be subsequently organized to purchase and operate the plant.

In most cases the parent company or the sub-parent company furnished all the money expended in obtaining the franchises and contracts and also all the money paid in purchase of land and erection of buildings and in purchase and erection of engines, boilers, etc., and furnished and erected all the electrical machinery, appliances and appurtenances common to electric lighting and power plants, the parent company or the sub-parent company, or both, charging on its books all actual expenditures, and for all material and machinery furnished to the plant, and carrying them as an asset in their accounts. In a very large number of cases they also paid all the operating and maintenance expenses, and furnished the means needed in effecting changes, or for extensions or improvements, the latter items again being charged on the books of one or both of the companies; and they continued to meet all running expense, and losses arising therefrom, and to carry the plant on their books until such time as it could be sold—if that time ever came, which was by no means always the case.

In the earlier period of the business in the Northwest the plan just outlined was the one generally, if not always, employed. And in pursuing this plan the Northwest Electric Construction Company, already referred to, put into operation a large number of local lighting and power plants in various cities, towns and villages in the States of Minnesota, Montana, North Dakota, South Dakota, Idaho, Wyoming, Washington, Oregon and the northern part of Wisconsin. A large number of these plants having been put into operation during the time the well known Mr. E. R. Gilman was president of the Northwest Electric Construction Company.

When Mr. H. M. Byllesby was sent by Mr. Coffin to St. Paul to take charge of the affairs of the Northwest Construction Company he found a large number of these local electric lighting and power plants carried on the books of that concern, most of which had been running at a heavy loss for a long time. It was, of course, impossible to continue to run them as they had been run, and equally impossible to dispose of them directly, or to realize anything from them in the way of money, or anything which could be used for the purpose of raising money. It was absolutely necessary, therefore, in order to meet the continuous heavy loss incurred in operating these plants, to devise some plan by which they could be put into such shape as to be capable of being utilized for the purpose of raising money. To effect this object a syndicate was organized for forming companies on these properties, and an account was opened on the books of the Northwest Company with this syndicate, and all these properties were transferred to the syndicate account. The syndicate thus became the nominal owners of the properties.

This syndicate then took the necessary steps to found companies on these properties, and as soon as a company was legally chartered the members of the syndicate, who were its only stockholders, met and proceeded to organize the company and to elect from amongst its members the board of directors, and these again elected their officers. The company so organized and constituted issued stock and bonds to the sub-parent Northwest Company in amount sufficient to pay that company for the book value of the plants, and the directors retained in their individual names sufficient stock to legally qualify them to fill their respective positions.

What was the actual value of these plants was indeed a very different thing from their *book value*, as we shall show later on.

Part of the stock and bonds so issued to the Northwest sub-parent company were then used to pay the obligations of that company to the parent Thomson-Houston Electric Company of Boston for the apparatus, machinery and appliances furnished and other items of indebtedness to that company, and were placed by this latter named company for disposal to investors in channels with which our readers are already familiar, or were otherwise used to raise money.

The syndicate referred to was composed entirely of the officers, clerks and other employees of the Northwest Company, and these men remained the virtual managers of the various local companies so organized, subject of course to the control and direction of the one master mind which had inaugurated and followed this same general scheme of financing electric properties in other sections of the country.

The actual running of the plants was turned over to two or more low salaried employees, who resided in or very near to the place where the plant was located, and who reported the results of its operation and made their returns to the sub-parent Northwest companies' head office, in St. Paul, on printed blank forms.

It will be noticed that this plan of "exploiting" local lighting stations, operating them and forming companies to conduct them did not depend, in the least, upon the ability of the company engaged in the scheme to induce the investment of one dollar of *local* capital in what was strictly a local enterprise. Nor did it depend on the direction or assistance in the subsequent management of the plant of a single person who was directly pecuniarily interested in the success or failure of the enterprise. The entire scheme was in fact one in which the whole of the capital necessary for establishing, maintaining and operating the plants was to be obtained from another and far distant section of the country, and the entire management and responsibility for the conduct of the enterprise was virtually absolutely in the hands of the employees of the promoting or exploiting foreign corporation engaged in *selling* electrical machinery and apparatus, which corporation was practically and actually under the control and subject to the supervision of the parent manufacturing company, the former company being legitimately mainly dependent for any material returns from its business on the profits due to the commissions on its value, and the latter named company being legitimately dependent upon the profits derived from the manufacture and sale of the machinery, apparatus and material made and sold by it.

As might be expected, such "exploiting" in a country with 3,602,990 square miles, with a population of some 62,622,250, very widely and quite thinly spread over that enormous area, and with some 99,000 cities, towns and villages, the field for operations of this kind was a very broad one indeed, and under these conditions could furnish an outlet for electrical apparatus, machinery and appliances which was truly remarkable and almost illimitable, and also gave unequalled opportunities for that kind of financing which has heretofore been (quite aptly we think) termed "Coffinesque."

THE CAUSE OF DEATH IN ELECTRIC SHOCK.*

BY A. M. BLEILE, M. D.,
Prof. Physiology, Ohio State University.

The work here given was undertaken with a view to elucidating the effects of larger quantities of electricity on the organism. Incidentally the value of artificial respiration after death by electricity was also tested. As this is the minor portion of the work, this part will be given first.

The data bearing on the subject in general are quite meager, especially as to the amount of current which actually passed through in fatal cases.

In all my experiments dogs were used, and in the subjoined table the weight, voltage, amperage and time are given for each case.

In the first experiment 525 volts, 2 amperes, were applied for 8 seconds; in the second, 220 volts, 1.2 amperes; in the third, 106 volts, .4 ampere, 10 seconds; in the fifth, 96 volts, .35 ampere, 2 seconds; in the sixth, 52 volts, .3 ampere, for 1, 2 and 4 seconds; in the seventh, 70 volts, .32 ampere, ½, 1 and 2 seconds, were used.

Before the application of the current a cannula was put into the trachea, so arranged that it could at once be connected with a bellows for the purpose of giving very complete artificial respiration. Respiration was set up as soon as the current was off, and this was continued for periods varying from 20 minutes in the first case to 2½ hours in the last, and in no instance was resuscitation accomplished.

Further work was carried on for the sole object of studying the effect of the current.

Our electrodes consisted of oval copper plates 3 by 2 inches, covered with sponges moistened with salt water. One electrode was applied at the base of the skull, and the other over the middle of the back, the hair of the animal having been previously well moistened with the salt solution. The current used was the alternating current of 130 periods per second. While the details of each experiment are given in the tables subjoined, a few are selected for special presentation. The larger voltages were abandoned for 100 volts, 70 and 50, as near as could be reached.

Ninety-eight volts with .32 ampere were applied first ½ second, then 1 second with recovery, but in two seconds produced death. Fifty-two volts with .3 ampere were applied 1 second, later 2 seconds, with recovery, then 4 seconds, producing death. Fifty-two volts, .24 ampere, applied 3 seconds, produced death. Fifty-one volts, .12 ampere, 4 seconds; 51 volts, .18 ampere, 4 seconds, were not fatal. Fifty-one volts, 2 ampere, 4 seconds, produced death. From these figures and similar ones to be obtained from the table, it is evident that the result depends, somewhat independently of the weight of the animal, on three factors: on the voltage, on the amperage and upon the time of application. A variation of either one of these factors may change the result—that is, a lower voltage with lesser amperage applied for a longer time will have the same effect as a current of higher voltage or more amperage applied for a shorter time. In this connection it was suggested by Prof. Thomas that the joules necessary would be found the same in each case, and calculations show that this is approximately true. To prove this absolutely it would, of course, be necessary to work with the minimum quantities as to voltage, amperage and time in each case, and no doubt one or another of these factors will be found in excess in most cases. In these experiments it is of great interest to point out this approximate relation between the results and the absolute amount of mechanical energy used. The results found on post-mortem examination of the animals were so uniform that they can be very briefly described. In all cases this examination was made immediately after death, and at first we wished to study the changes produced upon the heart, so that the incision was made through the chest walls and the heart exposed as rapidly as possible. This organ presented the following peculiar conditions. The left side was completely relaxed, the right side was intensely gorged with blood, as were also the large veins in the immediate vicinity of the heart, and the little appendages of the upper portion of the heart were found beating regularly, strongly and synchronously. Pressure on the heart caused a contraction of the other parts, and from this it was evident the death was not due primarily to the destruction of the heart fibers. In addition it was noted that the deep and extensive cuts made in the tissues were free from blood, and that the arteries were quite small and contracted.

This excluded a direct effect upon the heart, and, having shown by artificial respiration that the stoppage of this function was not the cause of death, other causes were to be looked for.

It was supposed that the current immediately struck the pneumogastric nerve stimulating those fibers which control the heart in that they have the power of arresting its beat when strongly stimulated. To test this view, resort was had to the hypodermic injection of atropine, the action of which drug is to paralyze the nerve fibers and thus prevent their action on the heart when stimulated. In one case $1\frac{1}{30}$ grains of atropine were given, 52 volts with .25 ampere were applied first for 2 seconds, then for 4 seconds, and this resulted in death. In a second case $\frac{1}{10}$ grain of atropine was given, 52 volts with .29 ampere were applied first 2 seconds, then 4 seconds, again resulting in death. These animals were not therefore rendered more resistant by the drug, and the theory as to the role of the pneumogastric nerve was abandoned.

I now recall the fact already mentioned that after death incisions into the animal are not followed by bleeding, that the arteries are contracted down to a very small caliber, and that the blood is crowded into the very large veins in the trunk. Taking these facts, it was suggested that the current acted upon the arteries through the nervous center which controls their diameter. It is well known that the arteries are supplied with a middle muscular coat in which the fibers are circular, and their contraction would of course cause a narrowing of the artery, rise of the blood pressure, and a consequent impediment of the heart's action; in fact it has been experimentally demonstrated that the arteries can be constricted to such an extent as to produce a rise of blood pressure which the heart is unable to overcome and that the circulation will stop from this cause. It is further known that we have in the brain most of the nerve matter whose function it is to control the vaso-motor nerves, the arteries at one time and in one place contracting and thus decreasing the amount of blood, at another time and in another place dilating and thus increasing the amount of blood getting to another particular part. To test this view, that the action of the vascular nervous system was the cause of death, we resorted to the hypodermic use of nitroglycerine. It is known of this drug that it powerfully affects the arterial system, causing, when given in larger doses, an extreme dilation of the arteries, and a consequent great lowering of the blood pressure.

The first animal received $\frac{1}{25}$ of a grain of nitroglycerine and, when the facts were fully established, a current, which was known to be fatal, was thrown in, namely 50 volts, .24 ampere, for 4 seconds, but the effects produced by this current soon passed off and there was complete recovery. Then 97 volts with .54 ampere were thrown in for 1 second but this caused death. In another case $\frac{3}{25}$ of a grain of nitroglycerine was used; here 25 volts, .22 ampere, a fatal dose, were thrown in for 4 seconds with recovery. One hundred and four volts, .6 ampere, were thrown in for 4 seconds producing death, but after the current was taken off there was noted 8 deep although irregular respirations. In other cases where the nitroglycerine was used, there was no apparent effect, but some investigation led me to attribute this to the unreliability of the tablets of nitroglycerine used, and this drug was thus abandoned for nitrite of amyl, a substance which has the same physiological effects as nitroglycerine but which can be always obtained pure, and the effects of which can be more accurately regulated because it is given by inhalation. In the first case the animal was brought moderately under the influence of the nitrate of amyl; 52 volts with .24 ampere were thrown in for 3 seconds (this by the way being a fatal dose ordinarily) without producing death. Fifty-two volts, .25 of an ampere, for 4 seconds, also a fatal dose, failed to produce death. Fifty-two volts, .3 of an ampere, for 6 seconds, produced death, but after the current was taken off, the animal made 22 deep, regular respirations though not a trace of the heartbeat could be made out, this incidentally proving that stoppage of the respiration is not the primary cause of death.

Three more experiments may be selected. Numbers 24, 26 and 27 of the table.

No. 24 was a pointer dog in excellent condition, weighing 34 lbs. Nitrite of amyl was given until the effects were fully marked. Fifty and five-tenths volts with .2 ampere were given for 3 seconds; after a pause the same quantity was given for 6 seconds, followed by recovery. Three days later the same dog, who showed no effects at all of the previous treatment, was given—without the nitrite of amyl—51 volts, .2 ampere, 4 seconds, producing death.

---

*A paper presented at the Twelfth General Meeting of the American Institute of Electrical Engineers, Niagara Falls, June 27, 1895.

In the last case a dog weighing only 12 lbs. and of such general condition of weakness that the assistants protested against his use as not being competent to demonstrate anything, was given a full dose of nitrite, then 50 volts with .6 ampere were applied for 4 seconds and followed by recovery. The dose applied for 6 seconds produced death, and here again several respirations were noted.

The statements made in regard to the cause of death by electricity are so at variance with one another that it is unnecessary to review them here. Among other plausible reasons it has been stated that the current has a direct disintegrating effect on the brain and nerve tissues and that herein is to be found the cause of the fatality. The disintegrating effects of the current on the brain and nerve tissue said to follow are not to be seen microscopically and the microscopic examination of these organs so far as made by us failed to reveal any change in their structure. It would appear therefore that death in electric shock is entirely due to the fact that the current produces a contraction of the arteries through an influence on the nervous system, and that this constriction of the arteries throws in such a mechanical impediment to the flow of the blood as the heart is unable to overcome, and that, where drugs are given to counteract this effect, much larger doses of electricity than the ordinary can be borne. While artificial respiration may be of value in simple stunning, when larger doses have been taken, no rational means of resuscitation have as yet been suggested.

I was enabled to carry out the above experiments by the loan of apparatus kindly furnished by Prof. Thomas and was greatly assisted in the work by Mr. Boyd, of the Physical Department, who was present at every experiment and who made the measurements for us.

The current was obtained from a surface wound alternator giving an approximate sine-curve. For potentials of 100 volts or less, connection was made with the secondary of a suitable transformer. Potentials of over 100 volts were taken direct from the primary circuit, adjustment being made by varying the generator field.

No.	Weight (lbs.).	Volts.	Amperes.	Time (seconds).	
1	21	325	2	8	Artificial respiration 40 min.—Death

23	17	51	.2	3	Small dose nitrite—Death.
24	34	50.5	.2	3 6	Full dose nitrite { Recovery. Recovery.
25	38	50.5 101	.2 .2 .5	4 6 2	Full dose nitrite { Recovery. Recovery. Death.
26	34	52	.12 .18 .2	4 4 4	Recovery. Recovery. Death.
27	22	50	.2	4 6	Full dose nitrite { Recovery. Death.

Voltages were measured by means of a Weston A. C. voltmeter. The mains supplying the current were of low resistance, so that the drop when the circuit was closed was found to be negligible. The figures given are the actual potential differences of the electrodes while the current was flowing through the animal, correct to within one-half volt. A Siemens dynamometer was used for measuring the current when the time of contact was less than four seconds. It was somewhat difficult to make a setting, so that readings for those short times can not be taken as correct within five per cent.

The Electric Light and Power Installation for the Railway Stations and Workshops at Dresden, Germany.*

The plant of the Dresden railway stations, the general features of which were briefly described by the writer (Dr. Ulbricht) in the *Elektrotechnische Zeitschrift* in 1893, began working on April 24, 1894, although at that time the plant was not provided with its full complement of machines. It has now four large alternators at work, of about 300 H. P. each, and room is left for the introduction of another if required, which will probably be of 600 H. P.

The object of the plant was to supply a number of railway stations for passengers and freight with light, as well as to supply power for a large number of motors used for driving machinery of all sorts in the construction and workshops about the stations.

The electrical machinery is the work of the Siemens & Halske Company of Berlin and is of the most advanced order.

The three rotary current or drehstrom dynamos are coupled each direct to the spindle of the engine that drives it. The armature is a fixed structure, and the field magnet system revolves inside the former. The armature windings consist of copper rods that are passed through the fixed iron ring of the armature, and this as well as the field magnet cores are built up of laminated iron and bolted together in sections. The normal voltage of these machines is about 150 and the maximum output is 220 K. W. There are 60 field magnets on the revolving ring, so that at 100 revolutions a minute the frequency of alternation will be 100 pulsations or reversals a second.

As seen from the picture of the drehstrom dynamo, Fig. 1, the exciter is an ordinary direct current machine of the Siemens & Halske make, the revolving part of which is carried upon the prolonged axis of the main dynamo. These exciters can give about 180 amperes at 110 volts. As the exciting current for each of the three dynamos is about 50 amperes, one of these exciters is about equal to the task of supplying, if need be, the fields of all four dynamos. However, to enable the ready substitution of one of these for the other in any field, their separate circuits are led to a special switchboard from which emanate the field circuits of the main dynamos and where any desired system of connections can be made at will. Usually two of these exciters are connected for the field excitation of two machines each, and the remaining two are used for lighting about the power house so as not to disturb the external circuits with this changing load.

The electric system finally chosen for this work is a modified drehstrom or multiphase current one. The various demands upon the different circuits, with so many motors everywhere in operation, at first suggested the use of the Drehstrom plan pure and simple, but the well-known difficulty of balancing the currents in the three different circuits under such varying conditions of load led the projector of this plant, Dr. Ulbricht, to consider seriously some other system than the drehstrom, with a view to obtaining a more efficient and reliable regulation; and upon his recommendation extensive experiments were conducted under his supervision at the Siemens & Halske Works to determine whether the system he had proposed was better adapted to a suitable regulation than the well known drehstrom. These experiments gave such gratifying results that the adoption of the modified drehstrom or "Ulbricht" system was decided upon, which in plain terms is one in which a single alternating current is used in the ordinary way to supply the entire lighting circuit, while a third or auxiliary circuit, having an

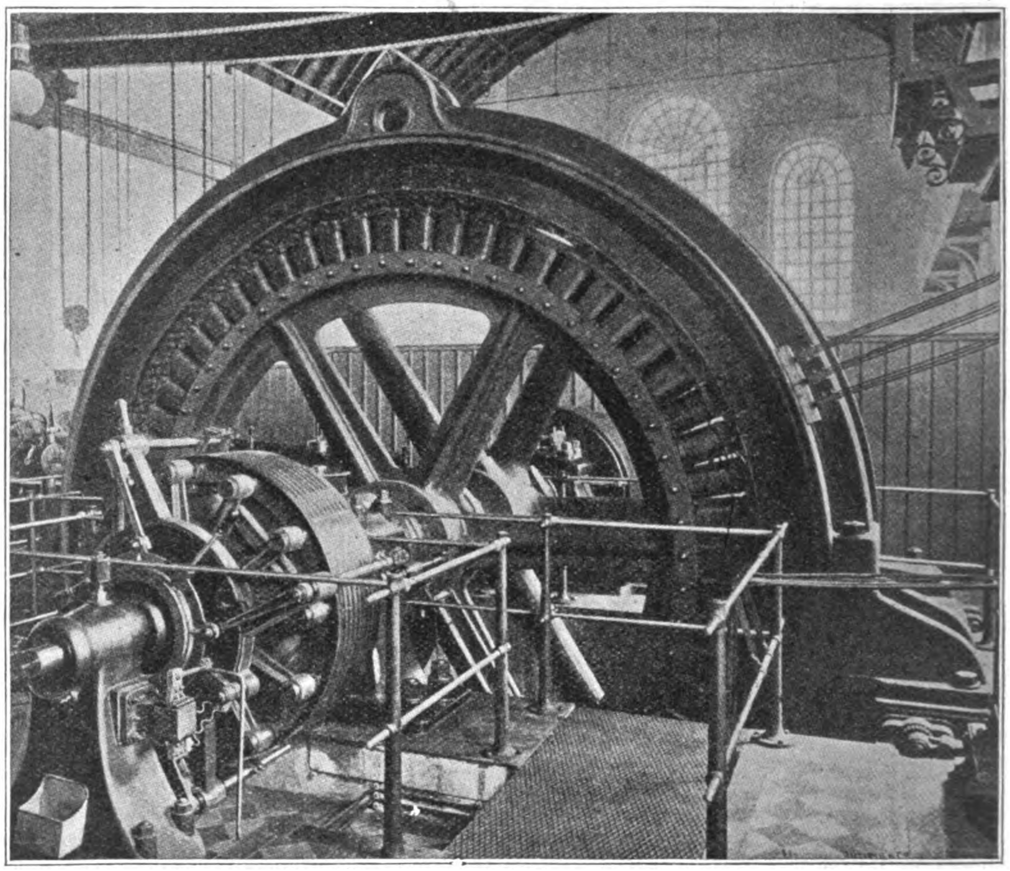

FIG. 1.—DREHSTROM DYNAMO.

---

* Abstracted from the "Elektrotechnische Zeitschrift" of July 4 and 11, 1895.

independent armature or generator winding, is connected one end to the middle of the other or principal armature winding, and its outer or free end through the usual sliding ring contact to the external auxiliary circuit. If now a circuit is connected from this auxiliary external line across to both the other lines of the main or light circuit, these circuits will have currents of different phase in them, and they will both differ generally by unlike amounts of phase difference from a circuit connected across the light leads. When, therefore, we connect an ordinary three-phase motor to the three external leads in the manner just described, it will be supplied with three currents not exactly in triphase relation, but nearly so, whence we see that so far as the power supply is concerned the system is nothing more nor less than a modification of a triphase system in which one circuit alone is used for the light supply and all three for power. It is also evidently identical in every particular with the much discussed "monocyclic system" of the General Electric Company, which is thus clearly shown to have been in use on a commercial basis in Europe nearly a year before any mention was made of it in the United States.

Since November last the practice has been to run a single drehstrom machine during the daytime for power service only and such lights as might be under immediate control of the works. At the beginning of twilight, first one machine is started up as a single phaser for the light supply, and as the load increases others are successively connected in the same way. So far as tried, the mixed service of light and power in the same circuits has given satisfaction, but the final test and proof of the system will have to wait for the completion and operation of the 40 H. P. lifting cranes in the harbor which will be put to work in a few months. So far, however, the plant has worked without interruption since first starting up, and the light and power loads have been constantly increasing until the monthly output now is 34,000 kilowatt hours for light service and 11,000 for motors. During the present month, however, the light service will be increased to 60,000 K. W. hours per month by adding the service for the passenger station at Dresden Altstadt, where seventy more arcs, a great many glow lamps and five motors for elevators will require current.

In this plant the extensive motor service is of special interest by reason of the great variety of work performed, as well as by the scattered nature of this service over a large territory.

In the circuit belonging to the workshops there are now forty-four motors, from 1 to 20 H. P. each, and aggregating a total output of 183 H. P.

These motors are the regular Siemens & Halske three-phase motors as built for ordinary Drehstrom service, and are all provided with a starting resistance which is introduced into the armature circuit until the machine has acquired its normal speed under load.

One of the many uses that electricity has been put to is for thief catching, and it has just served to relieve the employees of a large factory on the west side of Chicago of much uneasiness in regard to the missing of articles of raiment and money from the dressing room of the girls' department. A trustworthy girl was taken into the confidence of the management, and a double wire was sewn into the lining of her cloak, connecting a spring jaw in the pocket with the two hooks on which the cloak hung. From these connecting wires were carried under a molding through the floor to a single cell battery, and a bell placed in series was hidden in the room where the girls were at work, 50 feet away. A purse was put at the bottom of the pocket, which could not be molested without sounding an alarm, and the trap was set. In about three hours the bell rang and the owner of the cloak, hurrying to the dressing room, found one of the factory girls in the act of rifling her purse.

LOCATION OF GROUNDS IN ARMATURES, FIELDS, ETC.*

BY CLARENCE E. GIFFORD.

This paper presents no novel scientific principles. The methods herein described are but simple adaptations of the principle of the Wheatstone bridge. They have been in use by the writer for several years, and he, having devised them for his own use, and found them very rapid, accurate and simple, is led to believe that they may be of considerable service to others. The *Electrical World* "Digest" of March 16 notices a slightly similar, but evidently less perfect method, published by Mr. Bronsson in the London *Electrical Review*. The insufficiency of Mr. Bronsson's method in cases where two grounds at some distance apart exist is admitted. The methods herein described deal successfully with such cases.

If the work can be performed in a very quiet room, two or three cells of battery, a telephone receiver and connecting wires comprise the necessary apparatus. In some cases two "table binding posts" and a foot or two of No. 18 or No. 20 bright iron wire will be a convenient addition. Where noise will not permit the use of a telephone, a dead-beat reflecting galvanometer, a millivoltmeter, or some other form of delicate and rapid working visual indicator must be used instead. If an armature is to be tested without removing it from the machine, connection with the battery may be made through the brushes, first making certain that the short-circuiting switch is opened, if dealing with an arc machine. The points of connection with the battery need not be diametrically opposite, and may be made by the wires being firmly pressed against the commutator by an assistant, if more convenient.

Good electrical contact between metallic surfaces can better be secured by cleaning the same thoroughly with kerosene, which removes foreign matter, and is so fluid that it will in no way interfere with perfect contact when moderate pressure is applied. Especially when making measurement of resistance of armature sections, it is even advisable to have the surface of the commutator quite wet with kerosene during the operation, as this avoids trouble from grease or dirt which might get on the surface from handling subsequent to cleaning, and it also prevents the contact points becoming oxidized by any sparks which may occur at the moment of breaking contact. True, the oil is an insulator, but we use it in this case as a detergent simply.

Returning to the armature: connection being made between battery and commutator, first determine whether the armature circuit is complete throughout. If the circuit is complete, a click will be heard in the telephone when the two terminals of the same are brought in contact with any two contiguous bars of the commutator, or when contact is broken. If an open circuit exists on either side of the circuit, of course no sound will be heard in the telephone when used on that side, except when connection is made or broken by it between the bars lying on opposite sides of the break. See Fig. 1.

Close any open circuit temporarily by bridging between the two bars with a drop of solder. Two or more breaks can evidently be located by suitably shifting the battery contacts and searching as before. Open circuits will, of course, when an armature continues in work, soon cause burns between the bars that will indicate unmistakably their location. Having closed any open circuits, and the battery being connected to two points of the commutator approximately opposite each other, one terminal of the telephone is connected to the armature shaft, or frame of the machine, and the other terminal is drawn completely around over the surface of the commutator, while the telephone is held to the ear. If only one ground exists, two balancing points, or points giving the least noise in the telephone, will be found.

In an armature of ordinary construction, one of the points so found will be on the bar nearest the real ground, while the other balancing point bears what might be termed a "bridge relation" to the first, being at practically the same potential; the armature itself forming in reality a veritable Wheatstone bridge.

Now, shift the points of battery contact a few bars either way and the true ground, if but one exists, will be indicated in precisely the same position as before, while the other balancing point will shift every time the battery contacts are shifted. See Fig. 2.

If two grounds exist, two balancing points will be found, as before, but both points will shift more or less when the battery contacts are shifted, provided the grounds lie on opposite sides of the same battery contact. This case will be considered later.

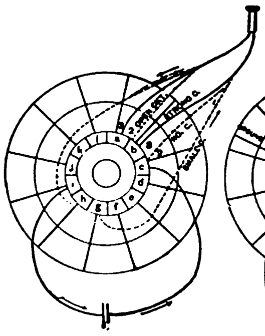

FIG. 1.

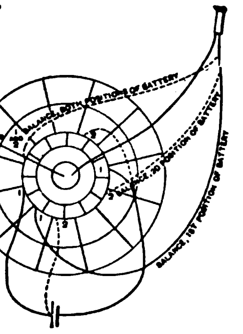

BALANCE, BOTH POSITIONS OF BATTERY
BALANCE, 2D POSITION OF BATTERY
BALANCE, 1ST POSITION OF BATTERY
1
2

FIG. 2.

In the case of one ground, having determined its location approximately, fix it as closely as may be by making and breaking contact with the telephone terminal on each of the more quiet bars, separately, until by comparison the two giving the faintest clicks are determined. If your hearing has served you correctly, these two bars lie nearest the trouble, the fainter one being the nearer. Prove the non-existence of a second ground by placing one of the battery contacts on the first bar to the right of the apparently permanent balancing point just found, and then on the first bar to the left of said point, the other contact being nearly diametrically opposite. This balancing point should still remain unchanged if no other ground exists.

The next step is to connect the battery to these two bars just fixed upon as lying nearest the trouble. The armature still forms a "bridge," the portion included between the two continuous bars to which the battery is now connected forming the one side, and the remainder of the armature the other side. See Fig. 3.

One of the telephone terminals is now connected to the shaft as before, and the other terminal again drawn around the commutator. If the balancing point is found, say one-sixth to one-half the long way around from one battery contact to the other (these contacts being on two contiguous bars), the trouble lies in the coil between those two bars, and the point of trouble divides the coil in the same ratio as the balancing point divides the remainder of the armature, the ground and the balancing point being respectively nearest the same battery contact. If the balancing point falls on the same bar as one of the battery contacts, the ground is located on that bar or on the lead between it and the armature, provided the balancing point is found to be upon the same bar when the battery con-

---

[*] A paper presented at the Twelfth General Meeting of the American Institute of Electrical Engineers, Niagara Falls, N. Y., June 25, 1895.

tacts are both shifted one bar to the right or left of their original position. See Fig. 4.

If the balancing point appears to be found within three or four bars from one of the contacts, the precaution should be taken to test its correctness by moving both battery contacts one bar toward the balancing point. If the trouble was between the battery contacts when in their previous position, this shifting of the contacts will now throw the balancing point clear around onto the contact which was in the previous position farthest away from the balancing point. If, on the contrary, the balancing point remains unmoved by this shifting of the battery contacts, it shows that this balancing point is the point nearest the real ground, and that the ear was deceived in its first supposed approximation, which, with due care, however, is not likely to occur.

If such error has been made, the new point, as indicated, together with first the bar on one side of it and then on the other, must be tried as points of battery contact; or, much better, make a new start with the contacts nearly at opposite sides of the commutator, and proceed as before. A single 20,000 ohm ground on a one ohm armature should be located accurately in not over three minutes, in a quiet room. Higher resistance grounds require more battery and more care. Armatures of very low resistance also offer greater difficulty.

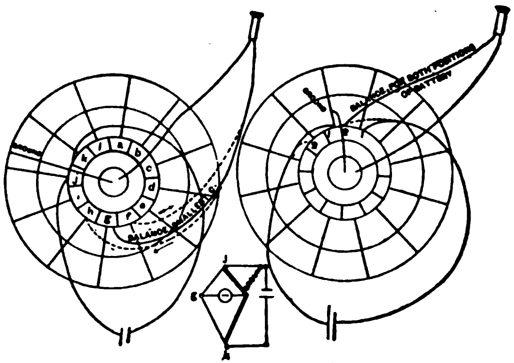

FIG. 3. FIG. 4.

Where two grounds are found to exist, as indicated by the change of location of both balancing points, under the conditions before stated, when the battery contacts are shifted, the following mode of procedure will answer the purpose well, and is simple. Fix the battery contacts at any two points of the commutator nearly opposite each other, preferably at points to be determined by trial, that will cause the balancing points to fall nearly diametrically opposite to each other, and determine and mark the two balancing points, as then shown. Now place the battery contacts on the balancing points just found. If only one ground exists, the two balancing points and one battery contact will all be coincident in one point. If two grounds exist, both balancing points will be shifted from their former position. Open the armature circuit by unsoldering one of the ends of a coil connecting with the lead of the bar that is marked in the first part of this test as one of the balancing points. Place one of the battery contacts on the armature shaft, and the other on the marked balancing point that is farthest from the point where the circuit has been opened. Next place one telephone terminal on the first bar to the right of the opened wire, and draw the other terminal from the same point, toward the right, over the surface of the commutator. The telephone will be absolutely silent until the moving terminal has just passed the ground nearest to it, and strikes the first bar beyond the same, when it will click. This ground lies in the coil between this first bar giving a click and the one passed just previously, or else in the said previous bar.

The other ground is obviously to be located in a similar manner, by placing one telephone terminal on the bar just to the left of the open wire, and from that point searching toward the left with the other terminal. Only in places where one ground is of very low and one of very high resistance will any difficulty be experienced in locating both accurately before either is removed.

The coils thus indicated may have their terminals unsoldered, when it can be readily ascertained with each, whether the ground be in the coil or in the bar just preceding it.

If scientifically inclined, or if otherwise preferable, the circuit may be opened at a point somewhere midway between the two indicated coils instead of disconnecting those coils, and the exact location of each ground determined as follows: Take a piece of "broom wire" about 18 inches long, new and clean, screw the ends firmly into two clean, brass table binding posts, and into the other holes of the same posts screw the battery terminals. Have an assistant press the corners of the bases of the binding posts into very firm contact with the two bars that lie at the ends of the indicated coil, observing the directions previously given for securing clean contact. Place one telephone terminal in contact with the shaft, and with the other find the balancing point on the wire. This point will indicate the relative position of the ground in the coil, or commutator bar, as the case may be. If more than two grounds were suspected, the two lying the farthest apart would be approximately located by the first part of the two-ground process, and if these coils were not disconnected before proceeding farther, it would be well to make two openings in the circuit, close to and lying between these outer grounds, then locate definitely these two extreme grounds, and proceed with the remaining section somewhat as with a complete armature, except that you would commence by connecting the battery to the terminals of this section, and would then bridge the telephone from the shaft to the different portions of the section, and would complete the process by applying the remainder of the two-ground test.

In dealing with a cross connected gramme ring, an obvious change would be made in the points of application of the battery, and as many points of apparent trouble would be indicated as there were series of cross-connections.

After location of these points it would be necessary to use the auxiliary wire loop as before described, between these points, to determine which is nearest the trouble. This fact being determined, it would in case of a single ground (indicated by the permanency of the balancing point) become necessary to remove the cross-connections from two bars before proceeding farther. The auxiliary wire loop would properly be used to complete the process.

The ordinary "closed coil" ring or drum armatures are types to which these methods are directly applicable.

The sections of open coil armatures would receive the same treatment as field coils.

Familiarity with any special forms of armature will doubtless suggest to the ingenious mind modifications of these methods suited to those forms, but it would be improper to attempt here to deal with specialties whose names are legion.

Where wet grounds exist it will always be better, when practicable, to dry them out before making the final test, as certain sections may show faults which will not be permanent. Wet grounds will of course give a click in the telephone when bridged from the commutator to the shaft when no battery is attached, owing to galvanic action of the water on the copper winding and iron core.

Whenever necessary to deal with wet grounds in testing, it is better to make at least four tests, reversing the battery after each test, and taking the mean of the four determinations.

Field coils, also any wires of uniform cross-section, the extremities of which are accessible and within a reasonable distance of each other, can of course be easily tested for grounds by soldering or firmly clamping a bare wire of suitable size between the extremities of the conductor to be tested, applying a battery to the junctions, and bridging with a telephone between the bare wire and the object upon which the conductor is grounded This will give only the location of a single ground, or the "resultant" of two grounds. A "T. H." rheostat should have the battery connected to the two extremities, and the point of apparent ground determined by bridging with a telephone between the frame and the several contact plates. Then apply the battery to the frame and point of apparent ground, connect one terminal of the telephone with each extremity successively, and search from it toward the center with the other terminal, as in the case of searching for two grounds in an armature.

In determining the location of grounds that are of very low resistance, a good induction coil similar to that used in the Blake transmitter may be used with advantage in connection with the telephone receiver. The receiver is placed in circuit with the secondary of the coil, and the "bridging" is done with the primary. With high resistance grounds the best results are obtained by using the receiver only.

EARTH CURRENTS AND THE EARTH DYNAMO.*

BY JAMES S. LANG.

With the advent of modern electrical transmission, there has come to inventors and scientists in general a partial realization at least of the tremendous waste of energy continually going on around us. Those more sanguine and less practical would harness the tides which roll against our coasts and compel the moon herself as she swings on in her path, a corpse among worlds, to drive our factories and light our streets.

And yet such visions are not wholly illusions, but are capable of being developed to a certain degree, by careful study of the conditions, with proper discrimination between the practical and the impractical.

One class of phenomena worthy of more attention than it has received is that relating to earth currents. This is not to be wondered at, as investigation flows in well defined streams, and the attention of investigators has been turned to subjects of more immediate pecuniary value.

The theory of their cause which I present here, and which is a result of the action of what I designate as the Earth Dynamo, appears to be borne out by the facts and phenomena observed.

It has been known for many years that there was an intimate connection between the sun spots, the magnetic needle and earth currents. This connection is so well marked, and its action is so certain, that it would indicate conclusively that magnetic polarity is possessed to an intense degree by the sun That the magnetic poles of the sun coincide very nearly with its geographical poles is shown by the fact that in the absence of spots no changes in the terrestrial magnetic state occur which have a periodicity equal to the time of solar rotation. The sun, then, we are forced to conclude, may be considered as a magnet, in the same way that we look upon the earth as one, and as such possesses its lines of force, which after having passed from pole to pole inside the sun, envelop and pass the earth at a distance of 91,000,000 miles on their return course. Far beyond our farthest planet these lines spread out in gigantic ellipses, bringing planet and asteroid alike into magnetic touch with the seething monitor of our solar system. And our planetary system is again and again permeated with weaker lines of force having their origin in other suns than ours, and our sun himself as he whirls ceaselessly onward, feels with his magnetic nerves the influence of the sidereal system of which he is a single atom. The milky way stretching across our sky points to our minds the direction of lines of force which have hurled together suns, stars and systems. Multiply the range of our telescopes by infinity and you would see other galactic belts, around, beyond and parallel to our own, stretching away into endless space—indices of lines of force—the handiwork of an infinite creator, the harmony of whose productions exceeds our wildest flights of imagination.

---

* From the Year Book of the Society of Engineers, University of Minnesota.

Thus we see that one factor of the magnetism of the earth is due to the lines of force passing through the sun, which penetrate the earth on account of its superior permeability.

That the magnetic poles of the earth are not stationary is shown by the constant diurnal variation of the magnetic needle. Their virtual traces on the earth's surface revolve in small circles around the traces of the main pole, and the angle between the two tangents to these circles drawn to a magnetic needle gives the amplitude of diurnal variation of that needle under normal circumstances.

It is plain that if a wire be suitably placed[*] on the surface of the earth, it cuts this revolving component of the earth's magnetism and we have earth currents as a result. We may consider the earth as a typical spherical armature, familiar to all, in the conductors of which, at times when the equatorial component grows large, we have high voltages.

We see, then, that earth currents may be due to the revolution of this earth armature in a magnetic field of which the sun is the immediate inducer. We are, then, led farther—why not wrap our earth with a suitable system of conductors and wrest from our mother earth an amount of power equal to that wasting at every tide on every sea.

It is easy to determine its feasibility, for we know that the intensity of the revolving equatorial component is equal to the sine of half the angle of the diurnal variation of the compass, times the intensity of the earth's magnetism. A difference of potential of one volt being produced in every conductor which cuts 100,000,000 lines of force per second, if we surround the earth with a coil of 100 wires, it may easily be shown that a difference of potential of upwards of 60,000 volts would be produced under normal conditions.

For wires extending both above and below the equator with turns connected in series, the following method of application will apply. Selecting such a position on the earth's surface that data applicable to that place will be approximately a mean for the whole surface, we may say that the actual intensity of the earth's magnetism is equal to the horizontal component times the secant of the angle of inclination of the dipping needle.

Taking horizontal component equal to .20 of a line per sq. cm. and inclination equal to 60°, we have for the intensity of the earth's magnetism .40 of a line per sq. cm.

The revolving equatorial component of this will be equal to .40 times sine 7′, when diurnal variation is 14′, which equals .0008144 of a line per sq. cm. The area swept over by a single wire placed as designated will be 2 × 48,375,360,000 sq. ft. or 2 × 44,940,709,440,000 sq. cm.

Therefore the voltage induced will be $\frac{44940709440000\text{x}2\text{x}0008144}{100000000}$ which equals 742. This multiplied by 100, the number of turns of wire used, equals 74,200 volts.

If the difference of potential was 60,000 volts in round numbers, and No. 0000 wire used, one-eleventh of an ampere would flow, and the total power produced would be 5,454 watts or less than 8 H. P. Although the amount would rise into hundreds of horse-power at those times when earth currents become abnormal, the enormous cost of the plant would forbid its practical application.

Thermo-electric Properties of Pure Metals.

Herr K. Noll, in *Ann. Phys. Chem.*, states that owing to considerable differences between the observations of different workers on the thermo-electric properties of metals, he redetermined the E. M. F. for various combinations, employing metals in as high a state of purity as was obtainable. In the first series of experiments the second metal was in all cases mercury and the temperatures of the junctions 100 deg. and 0 deg. The E. M. F. was determined by Du Bois Raymond's modification of Poggendorf's methods, Clark cells being employed as the source of the constant E. M. F. The results of these researches (expressed in microvolts) are contained in the following table, + values indicating a current from mercury to metal at the hot junction :

Bismuth	— 6,705.4
Nickel	— 1,664.2
Cobalt	— 1,522.2
Nickel silver	— 1,035.2
Platinum	+ 4.59
Aluminium	+ 362.4
Magnesium	+ 391.84
Tin	+ 396.03
Lead	+ 402.5
Brass	+ 433.3
Carbon rod	+ 662.88
Silver	+ 710.25
Gold	+ 713.35
Copper	+ 725.58
Zinc	+ 692.71
Cadmium	+ 875.09
Carbon filament	+ 1,452.
Iron	+ 1,601.4
Piano wire	+ 1,732.8
Antimony	+ 3,379.6

In many cases the effect of small quantities of impurities was very great. Thus platinum gave values as high as + 593.88 and copper as low as + 684.29 when the metals were not chemically pure. The state of aggregation had also a marked effect in some cases—for instance, silver (710.25; 671.51), zinc (692.71; 735.2), iron, brass, nickel. The second series of experiments was performed at various temperatures between 217 deg. and 0 deg., a number of experiments being made in each case. From the results the value for 100—0 deg. was calculated, good agreement with the observed value being in all cases obtained. The junctions were in some cases formed with mercury, in others with copper. The E. M. F. is given according to Gaugain by formula $\varepsilon = (t_1 - t_2) \{ b \pm c (t_1 + t_2) \}$. The values for b and c are deduced from two experiments, and the results calculated by their aid compared with the observations. The agreement is perfectly satisfactory. The value $\frac{d\varepsilon}{dt} = b \pm ct$ is then calculated, and as this can be expressed as $b \pm (k_2 - k_1)\, t$, where k_2 and k_1 are the constants for the different metals of the junctions, the numbers are referred to lead for which $k = 0$. The values thus obtained for the thermo-electric power $\frac{d\varepsilon}{dt}$ are compared with those of other observers. The difference in the result may be explained by the effect of impurities which, as is evident from the numbers, produce considerable variations.

Effects of a Recent Lightning Flash in Ben Nevis Observatory.

The following are some of the particulars sent to *Nature* by Mr. William S. Bruce, with regard to the effects of the recent lightning flash which struck Ben Nevis Observatory :

"Whenever a thunderstorm passes the summit of the Ben, there occurs almost invariably a discharge from metallic bodies in the Observatory as the cloud is passing away. A flash of greater or less extent is given off the stoves, accompanied by a sharp crack. In January, 1890, there was an exceptionally severe flash ; 'one of the observers was almost knocked down when sitting writing, and the telegraph wire was fused and all communication stopped for five days.' But more destructive than any previous flash was that which occurred this year on June 19, when the Observatory narrowly escaped being destroyed by fire. Between two and three o'clock that afternoon, repeated clicks on the telegraph instrument were heard by one of the assistants who was sitting in the office ; he had been carefully noting the times at which the clicks occurred, when suddenly the whole office was filled with a brilliant flash and deafening roar. A pillar of smoke was discharged from the telegraph instrument and from the stove-pipe, filling the room. A second slighter discharge took place immediately after, when the writer had entered the office to commence the 15 hours' observations. The discharge hurled two boxes and a small picture, that were in the vicinity of the lightning protector, across the kitchen, and blew off the button and outer casement of the electric bell in the visitors' room. The solder on the kitchen chimney outside, a copper fastening of the lightning conductor, and many portions of the telegraphic wire and apparatus were fused, and the woodwork of the Observatory was scorched in several places. The great flash occurred at 14h. 57½min., and the hourly barometric reading was taken at 15 hours, as usual. There was a very heavy fall of snow at the time, equivalent to 0·470 in. of rainfall for the hour, but in the confusion the writer omitted to take the rain gauge with him, and had to return for it. This was a fortunate incident; for it was only on leaving the office for a second time that he observed smoke and flame issuing from behind the panelling between the kitchen and the office. Assistance was secured, and the fire—which was in a very awkward and dangerous place—was overcome in good time, and the damage done was very slight. The damage done to the telegraphic apparatus, however, was serious. The lightning protector was badly fused, the plates showing a patch of fusion as large as a sixpence. All connecting wires within the building were rendered useless. The majority were so heated as to melt the insulation off, and in one or two cases the copper conductors were melted by the discharge. In one case the fusion set fire to the woodwork. The coils of Neale's sounder were fused and rendered useless. The keys suffered worst of all. The vacuum protector at Aslimtee, the base of the cable, also the plate protector in Fort William post office, were fused, but only slightly, the main discharge having expended itself on the summit. The low level Observatory instrument and protector were unimpaired, and communication between there and Fort William postoffice was carried on as usual after the removal of the fault in the post office protector. The registering aneroid shows a slight upward kick at the time, but the curve is otherwise fairly steady; the temperature was 31·7° F., the wind south-south-east and light. Heavy snow was falling at the time, which, with a fall on the 17th, made a total depth of nine inches on the summit. St. Elmo's Fire was very strongly felt and heard until after seventeen hours"

London Notes.

(From our Special London Correspondent.)

LIVERPOOL ELECTRIC LIGHTING SYSTEM TO BE BOUGHT BY THE CORPORATION.

From time to time controversies are carried on in the technical press as to whether local governing bodies or private individuals are the better able to carry on electric lighting installations. So far as practical experience goes, there has not yet been sufficient opportunity to judge from actual working which of the two parties can do the work more profitably. Most of our electric lighting concerns are even now too young for such comparisons to be fairly made. There have been instances in different parts of England of corporations and limited companies which have after a year or two realized excellent profits.

In some towns municipal bodies who let the electric lighting powers drift into the hands of private individuals are regretting the step and conducting negotiations for purchasing the systems; the experience of the companies has led to a decided move among local authorities to keep the work in their own hands.

The Liverpool Electric Supply Company Limited, which has for a few years supplied a certain area in Liverpool, has worked very successfully. Some months ago the Corporation began to consider whether it would not be worth its while to buy up the concern and run it itself before the value became greater than it then was. The result of these considerations was that negotiations were entered into with the company, Parliament's sanction was obtained, and £400,000 is to be paid by the Corporation for the entire undertaking. These terms will pay the company very well.

THE LIGHTING OF ECCLESIASTICAL BUILDINGS.

A short time ago I reported that experiments for the electric lighting of St. Paul's Cathedral had been carried out by Major-General Webber, and that the detailed results of these experiments were to be published in a paper by the Major before the Society of Arts. Owing to pressure of other work the paper has not yet been read, but will doubtless come on early in the next session. I now learn that similar experiments are to be carried out at Westminster Abbey. The organ-loft, which at best is a dismal place, is to be first treated. The organ-loft is situated within the screen and is at present lighted by gas. If the experiments in the loft are successful, it is probable that the interior of the entire building will be so lighted.

ISLE OF MAN ELECTRIC TRAMWAYS.

Twelve months ago there was opened in the Isle of Man a line of electric tramways running from Douglas to Laxey, a distance of a little under seven miles. There was a power station at either end and an accumulator station containing about 240 chloride cells about two and one half miles down the line.

This line has been worked so satisfactorily in every way (particularly financially, as this is a tourists' resort) that extensions were soon decided upon and have now been completed. The line was extended from Laxey to Mount Snaefell. Messrs. Mather & Platt have supplied five pairs of 150 H. P. compound engines and four boilers for the generating station. The line was opened for traffic on August 17th.

The Trolley in Suburban Traffic.

The Philadelphia *Press* predicts that the trolley or electrical street railway will eventually become more of a help than a hindrance to the prosperity of the main railroad lines. It says:

> Thus far the trolley has been the rival of the railroad in suburban traffic. In five years and after it will be its feeder. Thus far it is reducing railroad revenue. In five years it will increase it.
>
> Hitherto, after six miles or so from a city center is reached, for fifteen miles further suburban traffic has been necessarily drawn from a strip two miles wide each side of the track from station to station. Practically no one who takes a train over six miles from the city cares to live more than a mile from it. A few do, not many. This limits suburban traffic to a strip of residence territory two miles wide and fifteen miles long—say from six miles out to twenty one—or thirty square miles.
>
> The rural trolley, when it is developed, is going to make it possible to live five miles from a station and still make a train as easily as one once could a mile off with no trolley. The strip which feeds suburban traffic will be as before, from six to twenty one miles out, fifteen miles long; but it will be ten miles broad instead of two. It will be 150 square miles instead of thirty square miles.
>
> The area from which a railroad will draw its great flood of suburban traffic will be as large as the area of all Philadelphia. The railroad will carry it in mass. The trolley will collect it in detail.

Personal.

The many friends of Mr. L. Levy, of the Anthony Company, Cincinnati, have learned with deepest regret of the sudden death of Mrs. Levy.

Mr. J. J. Gates, general manager of the Perkins Electric Switch Manufacturing Company, Hartford, Conn., visited New York this week.

Tidings from Europe bring the information that J. W. Godfrey is thoroughly enjoying his sojourn there. When last heard from he was with his family at Baden-Baden, the Saratoga of Germany. During the east-bound passage of the Atlantic, Mr. Godfrey was, as is his custom, hail fellow well met with Hon. C. F. Crisp, Murat Halstead and other distinguished fellow-voyagers. At a concert given aboard the New York, Mr. Godfrey's abilities as an entertainer were brought into use, he having had the honor of starting the entertainment with an exhilarating overture, "Throw Him Down McCloskey," the rendition of which was received with hearty manifestations of approval.

General News.

What is Going on in the Electrical World.

Laurel, Md.—The electric light plant at the Keeley Institute in this place was destroyed by fire on the 16th.

Escanaba, Mich.—At the special election held here on the 17th, the people voted in favor of purchasing the electric light plant for $70,000.

Dallas, Tex.—The Rapid Transit Railway Company will issue $150,000 bonds, the proceeds to be applied to the improvement of their road.

Wilmington, Del.—The indications are that the Elsmere and Wilmington Electric Railway will shortly be built; the route has been surveyed.

Medford, Mass.—The International Lard and Oil Refining Company of New York intends, it is said, to erect a factory here and will put in an electric plant.

Dawson, Ga.—$10,000 of the $35,000 bonds authorized by the voters of the city have been sold in New York and that amount will be expended for electric lights.

Lynchburg, Va.—The Bedford City electric plant was sold on the 15th, under a decree of the court, to J. A. Clarke, for $10,050. The original cost of the plant was $33,000.

Hicksville, O.—A gentleman from Washington, D. C., representing Eastern capitalists, has been looking over the route for an electric road from Bryan, O., to Fort Wayne, Ind.

Greenbush, N. Y.—The trustees have granted a franchise to the Albany, Greenbush and Bath Railway Company to build and operate an electric street railway line in Greenbush.

Marion, O.—The project of building an electric railroad from Marion to Marysville by Prospect, Richwood, Magnetic Springs and Pharisburg is meeting with favor all along the line.

Frederick, Md.—The directors of the proposed Frederick and Middletown electric railway state that they now have only $5,000 to raise and expect to begin work on the road at once.

Newburg, N. Y.—The Homer Ramsdell Transportation Company are said to be behind the syndicate which proposes to build an electric railroad from this city to New Paltz via the Orange Lake road.

Niagara Falls.—Both of the 5,000 horse-power dynamos were tested a few days ago to full capacity in the presence of a number of experts who expressed themselves well pleased with the performance of the machines.

Van Buren, Ark.—It is stated that Colonel Sheldon is organizing a company to establish an electric light plant, and also that H. J. Isbell, of Parsons, Kan., is making preparations for erecting an electric plant in Van Buren.

Scranton, Pa.—The West Side board of trade have given favorable consideration to the plan of erecting an electric light plant in the operation of which the culm piles at the Oxford or Mt. Pleasant mines could be utilized as fuel.

Fort Wayne, Ind.—The electric railroad from this city to Lake Everett is now assured, as the commissioners have granted Mr. Everett a franchise; work on the road must begin within ninety days and the road be in operation within a year.

Shamokin, Pa.—The Schuylkill Traction Company and the Shamokin and Mount Carmel Electric Railway Company will build a connecting line from Ashland to Centralia, and then there will be a complete line from Shamokin to Mahanoy City.

Los Angeles, Cal.—The injunction against the sale of the Consolidated Electric Railroad was dissolved on the 17th inst. and the property was immediately bought by a syndicate representing the majority of bondholders. The bid was $1,500,000.

New Brunswick, N. J.—It is reported here that the Pennsylvania Railroad Company intends to convert its branch road from New Brunswick to Millstone into an electric railroad, on the plan of the branch road from Mount Holly to Burlington, N. J.

Peoria, Ill.—Congressman J. Frank Aldrich, of Chicago, has accepted the franchises granted by the council and will begin work at once on his new gas and electric light plant in this city. Mr. Aldrich is backed by a syndicate of which the leading member is John R. Walsh.

Lee, Mass.—Lee capitalists and mill owners are considering the project of establishing an electric plant to furnish power to various mills on the river from Lake May which depend on water and steam power. A stock company may be formed to push the thing through.

Eaton Rapids, Mich.—At the special election on the 19th, to consider the proposition of bonding the city in the sum of $35,000 to erect and maintain waterworks and an electric light plant, the waterworks was defeated while the electric light branch was carried by 151 majority.

Mifflintown, Pa.—The ordinance granting the Patterson Electric Light Company the right to erect a plant and furnish light in the borough of Patterson, Pa., has been published. The borough authorities have entered into a contract with the company for five years' public lighting.

Brooklyn, N. Y.—After a test of naphtha and electric lighting on about a mile and a half of Ocean Parkway for a month past, Mayor Schieren has decided on lighting the Parkway with electricity. Ninety large arc lights are to be erected and bids will be opened on the 31st inst.

Foxboro, Mass.—The Van Choate Electric Company's plant in this town is nearing completion. The gentleman who gives its name to the company promises to introduce to the world some electrical productions of a startling character—something as startling probably as the Keely motor.

Portland, Me.—It is not yet decided when work on the Portland and Yarmouth Electric Railroad will begin, but efforts are being made towards getting grants of location in Deering, Falmouth and Yarmouth and also in this city. If these result favorably, no time will be lost in constructing the road.

Youngstown, O.—The Park and Falls Company, which is building an electric railroad from this city to the southern part of Mahoning county, will increase the capital stock from $50,000 to $200.000 and will run the road into the North Lima coal field. The company also intends to do a general freight business.

Washington, D. C.—The next convention of the National Brotherhood of Electrical Workers will be held in this city October 11 to 17, inclusive. The leading men of the order throughout the country are discussing the topics of general interest which will be brought up for consideration during the convention.

Knoxville, Tenn.—The Citizens' Railway Company, which has filed an application for a charter, proposes to build and operate an electric line in Knoxville, West Knoxville, North Knoxville and Knox county. The incorporators are: W. G. McAdoo, Jr., F. K Huger, Geo. W. Henderson, R. H. Sanson, E. T. Sanford and T. H. Heald.

Wooster, O.—The Wadsworth Electric Railroad Company has been chartered to build a road from Wooster to Cleveland. It is privileged to carry passengers, baggage, express goods, United States mail and freight, and at proper distances spurs will be thrown out where cars can be left for farmers, dairymen, and others to load their products.

Syracuse, N. Y.—The Consolidated Street Railway was sold on the 17th inst., under foreclosure proceedings, to Frederick Strauss, of New York, for $865,000. Mr. Strauss bought the property for the majority bondholders. The only other bidder was H. Clark Ford, of Cleveland, who bid for the Syracuse Street Railroad Company $864,000.

Baltimore, Md.—Mayor Latrobe is in favor of an independent lighting plant for the parks. —The rumor that the Baltimore Traction Company and the City and Suburban Company are to consolidate seems to have some basis in the fact that representatives of the two systems have been in conference recently, and have, it is understood, agreed upon some of the details.

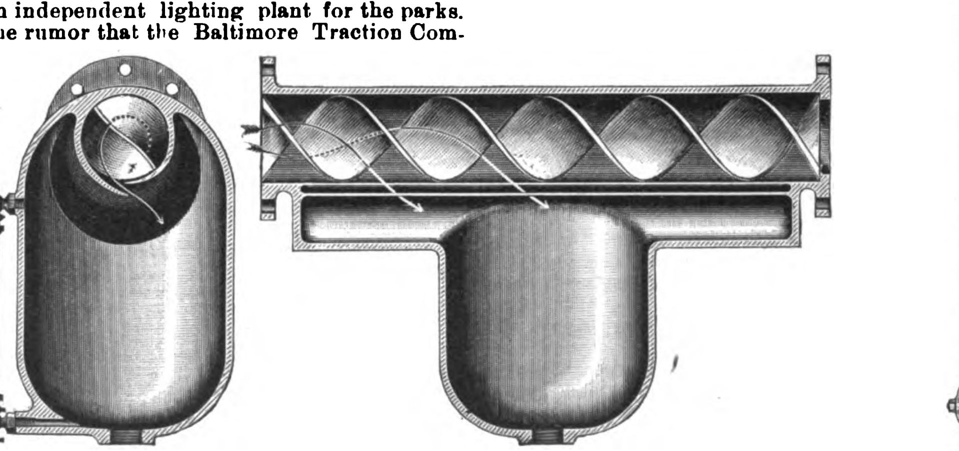

FIG. 1.—MOSHER SEPARATOR, LARGE COLLECTING CHAMBER.

Millbury, Mass.—Millbury and Sutton have granted a franchise in their limits to the Blackstone Valley Electric Railroad and Grafton will probably do likewise. Northbridge declines to let the road in, but the people are said to be in favor of the road and at the next election will choose a board of selectmen more favorable to progress than the present board.

Louisville, Ky.—It is now almost certain that the electric railroad between Louisville and Fairfield will be built. The $9,000 necessary to secure a charter has been subscribed, and articles will be prepared without delay. Among those interested are Judge W. H. Ellaby and F. H. Carrithers of Mt. Washington; Judge W. B. Hoke, L. De Witt, Stephen Lloyd, James McKenna and Robert Mills of Louisville.

St. Joseph, Mo.—The property of the St. Joseph Lighting and Traction Company, including all the street railway lines in the city and the electric light plant, was sold at auction on the 21st inst., to satisfy a mortgage of the Central Loan and Trust Company of New York. The property was bid in by A. Harriman, of Portland, Me., and O. P. Harriman, of New York, acting as trustees for the stockholders.

Boston, Mass.—It is possible to go by electric cars from Boston now as far north as Marblehead, Beverly, Wenham, Danvers, Reading and North Woburn; as far west as Waltham, West Newton, and Newton Upper Falls; and as far south as Dedham, Stoughton, Brockton, Whitman, Rockland and Weymouth. The Gloucester, Essex and Beverly Street Railroad was opened last week, and a line is running to Ashland from Newton Lower Falls.

Alton, Ill.—The stockholders of the Alton Electric Street Railway Company have authorized the directors to sell and dispose of all franchises whatsoever belonging to that company to the Alton Railway and Illuminating Company in consideration of the latter assuming all indebtedness of the company, and issuing stock to the stockholders of the old concern to the amount of $100,000. This completes the transfers incidental to the consolidation of the lighting and street railway companies.

Staten Island, N. Y.—The Staten Island Midland Railroad has been sold. The new purchasers are experienced electric railroad men, who will proceed at once to rebuild and electrify the present lines and make extensions. The company has been reorganized with the following officers: James C. Hincliffe of Paterson, N. J., president; Benjamin E. Throop of Scranton, Pa., vice-president; W. B. Rockwell of Scranton, treasurer and general manager; E. G. Wightman of Middletown, N. Y., secretary, and M. J. Wightman of Scranton, electrical engineer.

Richmond, Va.—A long and bitter fight for a franchise has just come to an end through the common council's voting to give the Richmond Traction Company, a new corporation, the right of way for an electric line in Broad street. The Richmond City Railway Company had for weeks been making extraordinary efforts to obtain the franchise, and the committee on streets had reported in their favor, but they were defeated in council by two votes. The winning company agrees to give the city five per cent. of the gross receipts, to sell six tickets for 25 cents, and to let school children and working people (during certain hours) ride for half fare.

Tonawanda, N. Y.—The Ely Railroad between Buffalo and Niagara Falls is about completed. In length the new line is 16 miles. The date for the formal opening of the road has not yet been set, but it is thought by the middle of September cars will be running regularly over the line.—The location for the test of electricity as a motive power on the canals has been fixed within the limits of this city; the date is September 25. The cable or traction system will be used and both preliminary and official tests will be made. The experiments will be made with eight or ten canalboats lashed together, which it is expected to move at a rate of about six miles an hour.

Albany, N. Y.—The promoters of the proposed Albany, Helderberg and Schoharie Electric Railway have elected the following officers: President, John W. Van Valkenburg; vice-president, Jonas S. Brooks; treasurer, Theodore Little; secretary, W. H. Erwin. Directors: Jonas H. Brooks, Benjamin M. Secor, L. C. Warner and John W. Van Valkenburg, of Albany; Dr. O. C. Snyder and Jacob Kelsch, of Gallupville; C. E. Dietz and T. J. Wood, of Berne; J. M. Ervin, of New Salem; Dr. C. J. Crounse, of Clarksville; Harrison Tinkle, of Greenbush; E. Twichell and C. Kromer, of Schoharie. The capital stock of the company will be $350,000. According to the articles of incorporation the road may be operated by compressed air, electricity or steam.

Milwaukee, Wis.—The stock of the Milwaukee Arc Light Company has been bought up by the parties interested in the Milwaukee Street Railway Company, it is said, and if this is the case the latter company gets control of all the lighting plants in the city with the exception of the Pabst plant The Arc Light Company is capitalized for $100,000 and its service is confined to residences and business establishments.—The Calumet Club gave a trolley party here on the night of the 15th, and caused as much excitement and enthusiasm as the "Greatest Show on Earth" ever did by its flaming pageants. There were ten trolley cars in the procession carrying 400 persons including a band of music, and the streets through which they passed were made radiant by incandesent lights and crimson fires. After the trolley ride, which occupied about two hours, lunch was served at the clubhouse and this was followed by a dance.

The Mosher Steam Separator.

In the Mosher Steam Separator, illustrated in the accompanying cuts, it will be observed that the utilization of centrifugal force is the principle of operation, acknowledged to be the only successful method of separation. The construction of the Separator is extremely simple. The steam conduit consists of a slightly enlarged section of the main steam pipe in which is located a worm or twisted plate. The wall of this conduit is of spiral form with one lip below the other, thus forming a slot through which all moisture is thrown to the collecting chamber below. Thus the steam is acted on many times in its passage around the twisted plate, and the heavier particles being thrown outwardly by centrifugal force are shaved off and deposited in the isolated chamber below from which it may be returned to the boiler.

The Separator is also made with small collecting chamber, rendering it more compact and adapted to places where other styles would be excluded on account of limited space. This style is peculiarly adapted to the extraction of oil from exhaust steam, rendering a considerable saving in oil and preventing destruction of roofs; on exhaust pipes when steam is used for heating purposes, to keep pipes and radiators from becoming clogged with oil; between cylinders of compound engines to extract water of condensation; between low pressure cylinder and condenser to avoid the clogging up of condenser by oil from cylinders; also in ice and refrigeration plants to extract the oil from ammonia gas, thus providing against the pipes becoming coated on the inside by oil. In the last-named capacity the Mosher Separator is the only device that has successfully accomplished this extremely difficult problem of separation.

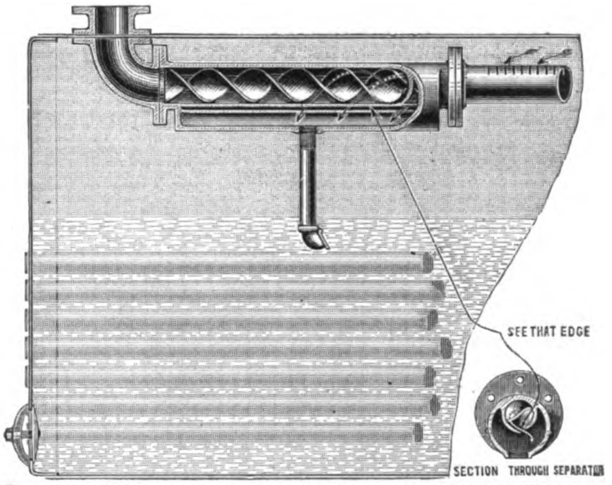

FIG. 2.—MOSHER SEPARATOR APPLIED INSIDE OF BOILER.

Many boilers are subject to violent priming or foaming during which a considerable amount of water is carried out of the boiler. In such cases the trouble may be entirely avoided by the introduction of a Mosher Separator inside the boiler, as shown in Fig. 2. The Separator, which by reason of its small size may be introduced through the ordinary manhole and connected between throttle and a perforated dry pipe, will prevent any possibility of wet steam leaving the boiler due to primage and therefore furnish dry steam at all times regardless of how severe the boiler may "foam" or "prime."

The Mosher Separator is built in sizes from one and one-half inches to any size required. Separators are tested for 200 pounds working pressure per square inch. These re built by Charles D. Mosher, 1 Broadway, rho will be pleased to send his "Treatise on eparator" to all who desire it.

Large Sales of Beacon Lamps.

n Lamp Company has closed a contract with lectric Light Company for 9,000 lamps, to be eek in the Knight Templar decorations in so for 1,000 special lamps for Keith's Theater purpose. Another good award is a Governt for 10,600 lamps to be used at the Boston

MERCIAL PARAGRAPHS.

l Lead Company, 1 Broadway, New York, amphlet entitled "Concerning Babbit and Metals," which the users of these metals will resting.

Conduit and Insulation Company of New e that they have secured the services of Noll, late of the firm of Noll & Sibley. Mr. been well known in the electrical trade of y for the last fifteen years, will manage the ior Conduit, Motors, Dynamos, Fans, etc., politan district of the Interior Conduit and mpany.

INCORPORATIONS.

The Buena Vista Light and Power Company, Buena Vista, Va.—to manufacture light, power and heat. Capital stock, $25 000. Promoters: S. E. Egolf, R. B. Embree, H N. Egoff, E. L. Embree, Buena Vista, Va. Thos. Bohman, Philadelphia, Pa.

The McGregor Electric Light and Power Company (incorporated in Iowa), La Crosse, Wis.—to construct, maintain and operate a plant for the generation and distribution of electric light, etc. Capital stock, $10,000. Promoters: Clark W. Thompson, H. W. Thompson, Charles F. Speed.

The Texas Telephone and Telegraph Company, Galveston, Texas. Capital stock, $100 000. Incorporators: M. M. Levy, J. Lobet and S. Blum.

The Spirit Lake Telephone Company, Spirit Lake, Ia.—to operate a telephone exchange. Capital stock, $10,000. W. W. Pritchard is president; L. H. Farnham, vice-president; H. E. St. Clair, secretary, and F. W. Barren, treasurer.

The American Signal and Power Company, Minneapolis, Minn.—to manufacture electrical and other instruments, devices, apparatus, appliances, novelties, etc. Capital stock, $100,000. Promoters: Henry B. Higgins, Charles M. Wilkinson, Charles J. Traxler, Minneapolis.

Mineral Point Telephone Company, Mineral Point, Wis. Capital stock, $1,500. Incorporators: N. H. Snow, W. R. Smith, Phil Allen, Jr., and others.

The Richmond Standard Telephone Company, Richmond, Va.—to promote, establish and maintain the business of a telephone company. Capital stock to be not less than $100,000, nor more than $300,000. The following officers have been elected: John C. Robertson, of Chesterfield County, president: R. H. Smith, of Richmond, secretary and treasurer. The above with the following form the board of directors: A. B. Guigon and Thomas R. Marshall, of Richmond; James F. Bradley, of Manchester, and George W. Cross, of New York.

The Ohio Automatic Telephone and Switch Company has filed articles of incorporation. The company will begin business with a capital of $250,000, and will have its start in Elizabeth, N. J., with an office in Cleveland, O. The incorporators are Col. William K. Fogg and William S. Thyng, of Roselle, N. J.; John W. Lovell, of New York, and Lewis H. Allen, of New Rochelle, N. Y.

The California Light and Fuel Company, Los Angeles, Cal.—to acquire, construct, lease, sell gas works, gas, electric light, fuel and power works, etc. Capital stock, $3 0,000. Promoters: Thaddeus S. C. Lowe, Leon P. Lowe, H. C. Brown, all of Pasadena, Cal.; G. W. Cochran, J. M. C. Marble, Los Angeles.

The Portland and Western Railway Company, Portland, Ore—to build and construct numerous electric and cable street railroads in the suburbs of Portland and other cities, and do numerous other things. Capital stock, $25,000. Promoters: S. Z. Mitchell, W. F. Nelson, Frederick V. Holman, all of Portland.

A charter has been applied for by a number of citizens of Jefferson, Ga., who desire to be incorporated as the Jefferson Telephone and Telegraph Company. They will build a telephone system from Jefferson to Harmony Grove, Athens, Winder, Mayesville, Pendergrass and Hoschton.

Articles of incorporation have been filed for the Saugatuck and Ganges Telephone Company, Saugatuck, Mich. The incorporators are: E. E. Brunton, Fred Wade, H. H. Hutchins, Charles E. Bird and H. Bird, Jr. The capital stock of the company is $10,000. It is proposed to build and operate about one hundred miles of line, connecting some dozen or more towns. Work on the first section, to extend from Holland to South Haven, has already begun.

The Western Union Telephone Company, Chicago, Ill.—to manufacture telephones and apparatus. Capital stock, $100 000. Incorporators: Arthur Dixon, Wilfred Massey and Samuel B. Foster.

Articles of incorporation of the Standard Telephone Company, Lansing, Ia., have been filed at Waukon. The capital stock is $25,000. The company intends to first build a local county system and then extend to Southern Minnesota points and La Crosse, Wis.

An application is to be made to the Governor of Pennsylvania by M. R. Thomas, Robert Augustine, Dr. T. J. Jacobs, G. W. Umbel, Wm. A. Frey and others, for the charter of the Somerfield Telephone Company, the lines of which will connect Petersburg, Somerfield, Harnedsville, Confluence, Ursina, Listenburg and other towns in Somerset County, and Markleysburg, Uniontown and other towns in Fayette County, Pa.

The Allegheny and Chartiers Railroad Company—to build an electric railway to connect Carnegie, Idlewood, Crafton, Ingram, Sheraden and Beltzer with Allegheny, Pa. Capital stock, $150,000. Directors: George H. Browne, T. W. Seimen and W. D. Uptegraff.

The Franklin and Oil City Rapid Transit Company, Venango County, Pa.—to operate an electric road between Franklin and Oil City. Capital stock, $70,000. William J. Welsh, of Franklin, is president of the company, and the principal stockholder is Charles W. Mackey.

The City Electric Light Company, Danville, Ill. Capital stock, $15,000. Incorporators: Frank Lindley, Daniel Gregg and Robert Holes.

The Wooster, Medina and Cleveland Street Railway Company, Wooster, Ohio—to operate an electric railway through counties of Wayne, Medina, Summit and Cuyahoga, Ohio. Capital stock, $10,000. Promoters: L. P. Ohlinger, F. H. Harding, J. R. Zimmerman, C. W. Kenke, A. Cunningham, C. V. Hard, W. J. Mullins, Chas. W. Fawcett, A. D. Metz, A. M. Parish.

The International Electric Company, St. Louis, Mo.—to manufacture incandescent lamps, etc. Capital stock, $25,000. Promoters: J. M. Davey, H. B. Russell, H. E. Chandler, H. C. Ferguson, St. Louis; Geo. De Lisle, St. Charles, Mo.

The Leroy Hydraulic Electric Company—to manufacture and supply electricity in Leroy, N. Y. Capital stock, $65,000. Directors: Charles F. Prentice, D. Howard Prentice, Calvin N. Keeney, John P. Sampson and Wm. F. Huyck, of Leroy.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED AUGUST 20, 1895.

ELECTRIC RAILWAYS AND APPLIANCES.

544,677. Trolley-Arm and Attachment Therefor. George Maag, Newark, N. J.; Joseph Ayers administrator of said Maag, deceased. Filed Dec. 12, 1894.
544,6?5. Electric Locomotive. Edwin H. Porter, Radford, Va. Filed June 22, 1894.
544,7 4. Automatic Safety Trolley. James B. Scranton, New Haven, Conn. Filed March 10, 1895.
544,794. Trolley-Arm and Wire-Finder. Frederick W. Riess, Philadelphia, Pa. Filed June 10, 1895.
544,862. Electric-Railway. James F. McLaughlin, Philadelphia, Pa. Filed April 18, 1895.
544,863. Electric Railway. James F. McLaughlin, Philadelphia, Pa. Filed May 3, 1895.
545,009 Trolley. George W. Biddle, Chattanooga, Tenn. Filed Feb. 2, 1895.

DYNAMO ELECTRIC MACHINERY.

544,654. Plant for Generating Electricity. George R. Bowen, San Antonio, Tex., assignor of one-half to William Warren Gibbs, Philadelphia, Pa. Filed Feb. 21, 1895.
544,696. Dynamometric Governor. William N. Smith, Chicago, Ill. Filed Aug. 16, 1894.
544,749. Electric Motor. Benjamin P. Remy, Peru, Ind. Filed Nov. 24, 1894.
544,768. Electric Elevator. Nils O. Lindstrom, Union Course, assignor to the A. B. See Manufacturing Company, Brooklyn, N. Y. Filed May 4, 1895.
544,780. Electric Elevator. John C. Winters, Mount Morris, N. Y. Filed Dec. 3, 1894.
544,844. Carbon-Brush Holder for Dynamo-Electric Machines. Alexander J. Churchward, Brooklyn, N. Y. Filed May 14, 1894.
544,861. Applying Power at a Distance by Means of Electricity. James F. McLaughlin, Philadelphia, Pa. Filed Oct 8, 1891.
545,005. Multiple Electric Circuit and Mechanism for Maintaining Same. Timothy K. Ames and Elbert A. Parker, Peterborough, N. H. Filed Oct. 10, 1894.

BATTERIES.

544,6?2. Secondary Battery. Frank King, London, England. Filed April 5, 1895.

TELEPHONE AND TELEGRAPH APPARATUS.

.41,711. Telephone Switch and System. Ernest C. Wilcox, Meriden, Conn. Filed May 13, 1895.
541,876. Ship's Telegraphic Apparatus. Johannes K. Adelsberg, Liverpool, England, assignor to the Walker's Engine Speed Indicator and Recorder Company, Limited, Durban, Natal. Filed March 16, 189 .
544,890. Magneto-Electrical Telephone. Max Frank, Munich, Germany. Filed June 30, 1894.
544,901. Telephone-Exchange Apparatus. Joseph J. O'Connell, Chicago, Ill., assignor, by mesne assignments, to the American Bell Telephone Company, Boston, Mass. Filed April 29, 1893.

SIGNALS AND SIGNALING APPARATUS.

544,617. Automatic Electrical Railway-Signal. Charles R. Alsop, Middletown, Conn. Filed Oct. 22, 1894.
544 802. Railway-Signal. William B. Vansize, New York, N. Y. Filed July 18, 1895.
544,937. Electric Train-Signal. Francis C. E. von Sternberg, Brooklyn, N. Y. Filed April 13, 1895.

MISCELLANEOUS.

544,745. Electrically-Controlled Weighing Apparatus. Lorenzo H. Nutting, Davenport, Iowa. Filed Nov. 13, 1894.
544,747. Manhole for Electric-Cable or Other Subways. Ernest L. Ransome, Chicago, Ill. Filed Jan. 11, 1895.
544,778. Insulator for Electric or Other Wires. Clinton Sproat and Edward N. Tarr, Taunton, Mass. Filed Jan. 2, 1895.
544 781. Electric Switch. Thomas H. Brady, New Britain, Conn. Filed May 8, 1895.
544,847. Apparatus for Insulating Electrical Conductors. Louis W. Downes, Providence, R. I. Filed April 6, 1895.
544,868. Apparatus for Training Horses or Other Animals. Albert H. Simpson, Leeds, England. Filed April 11, 1895.
544,894. Fire-Extinguisher William Harkness, New York, N. Y., assignor to the General Fire Extinguishing Company of New York. Filed Aug. 13, 188 .
544,959. Insulator. Reuben G. Collins and Frank W. Foley, Dollar Bay, Mich. Filed Feb 25, 1895.
545,020. Electrically-Controlled Winding Mechanism for Time-Locks. William H. Hollar, Philadelphia, Pa.; George L. Weaver, Boston, Mass., and Anthony Kennedy, Charlestown, W. Va.; said Weaver and Kennedy assignors to said Hollar. Filed April 1, 1895.
545,021. Electric Winder for Time-Locks. William H. Hollar, Philadelphia, Pa.; George L. Weaver, Boston, Mass., and Anthony Kennedy, Charlestown, W. Va.; said Weaver and Kennedy assignors to said Hollar. Filed April 17, 1895.

THE TELEPHONE WORLD.

Telephone Litigation.

Text of Bill of Complaint in Bell vs. National Telephone Manufacturing Company.

The following is the full text of the bill of complaint in the suit of the American Bell Telephone Company vs. the National Telephone Manufacturing Company:

I.

1. On or about June 4, 1877, Emile Berliner, then of Washington, in the District of Columbia, being theretofore the original and first inventor of certain new and useful improvements in electric telephony (sometimes known and herein spoken of as the variable-pressure contact telephone or microphone), made application, in due form of law, to the Commissioner of Patents of the United States for the grant of a patent securing to him the exclusive property in his said improvements, which had not been known or used by others in this country, nor patented or described in any printed publication in this or any foreign country before his invention thereof, and which had not been in public use or on sale for more than two years prior to his said application. And subsequently, and before the grant of the patent herein sued on, the said Berliner, by an instrument in writing, duly assigned unto the American Bell Telephone Company the said invention and the said application, and the patent to be issued thereon, which assignment was duly entered of record in the Patent Office before the grant of the patent herein sued on.

2. Thereupon, after due proceedings in all respects according to the requisitions of the statutes in such case made and provided, letters patent of the United States numbered 463,569, dated the 17th day of November in the year 1891, signed by the Secretary of the Interior and countersigned by the Commissioner of Patents, were issued under the seal of the Patent Office and delivered unto the said American Bell Telephone Company, as assignee of said Emile Berliner; whereby was granted to it, its successors or assigns, for the term of seventeen years from the said date of the same, the exclusive right to make, use and vend the said invention throughout the United States and the Territories thereof; as will more fully appear by the said patent, or by a copy of the same duly certified from the records of the Patent Office, and in this court to be produced. And your orator avers that it has given sufficient notice to the public that any article patented in and by said letters patent, and made or vended by your orator, is patented, either by fixing thereon the word "patented" together with the day and year the patent was granted, or, when from the character of the article this could not be done, by fixing to it, or to the package wherein one or more of them was enclosed, a label containing the like notice.

3. Ever since the grant of said patent the sole and exclusive right to make, to sell, and to authorise others to use telephones embracing the invention of said patent, has been and it still is invested in your orator, the American Bell Telephone Company. The only rights possessed by other persons thereunder have been licenses limited as to territory or use, or both, to use telephones procured from your orator, the American Bell Telephone Company, upon payment of stated royalties according to the nature and duration of the use. By means of which the American Bell Telephone Company and its various licensees as aforesaid long have been and are now engaged in the business of furnishing such telephones to the public within that territory, and are at all times ready so to furnish them to all persons upon the terms, conditions and price uniformly established for all users. Extensive lines and plants have been established by them for that purpose; and any infringement of your orator's rights in the premises is a cause of great, serious and irreparable injury and interference with the said business and business interests so established as aforesaid.

II.

4. The art of electric speaking telephony was first known to the public in the spring of the year 1876, Alexander Graham Bell's first speaking telephone patent being dated March 7, 1876; and electric speaking telephones first went into commercial use in the spring of the year 1877, in the form of the magneto telephone invented and patented by said Bell by his patents of March 7, 1876, and January 30, 1877. Emile Berliner's said application of June 4, 187, was preceded by a caveat filed by him in the Patent Office on April 14, 1877, which described the invention on which this suit is brought.

5. As early as the year 1878 it was publicly and generally known, especially to those interested in the art and business of telephony in connection with the American Bell Telephone Company or its predecessors in interest, and to those interested adversely to them, that Emile Berliner claimed that he was the true, first and original inventor of the variable-pressure contact telephone, that he had filed an application for a broad patent thereon, and that the American Bell Telephone Company or its predecessors had become the assignees and owners of his said invention and rights growing out of it or resting upon it, and were prosecuting his application. In and before the year 1879 speaking telephone transmitters embodying and known to embody that invention went into extensive and general public and commercial use throughout the United States and in other parts of the world; and the great superiority of transmitters which embodied this invention over those which did not embody it was known and recognized; and at said time and ever since, it was known and recognized that the patent sought for by the American Bell Telephone Company, as assignee of Emile Berliner as aforesaid, if granted with the broad claims asked for, and which are contained in the patent as granted, would, so far as could be seen, if valid, practically control commercial telephony. The effect and importance of the patent so sought by the American Bell Telephone Company, as assignee of Berliner, and on his said application, were thus generally and publicly known and understood both to the officials of the Patent Office and to all persons interested in telephony, and to and by the general public, in 1880 and before.

The invention of the speaking telephone and the principal forms of it, including the variable-pressure contact telephone, were also the subject of much controversy both in public discussions, in the Patent Office, and in the courts.

6 The controversy and litigation which thus began in the year 1878 or before, was of such a nature as to lead and induce all persons who had, who thought they had, or pretended to have, any claims or pretensions to be original inventors of the electric speaking telephone or its principal members, including the microphone as one form of it, to make them publicly known and to assert them; and to induce and lead persons interested adversely to the American Bell Telephone Company to search for publications which, and for persons whose work, could be supposed to embody any early important inventions in telephony. Thus for many years before the issue of the Berliner patent in suit, in 1891, the history of the art and the work of all those by or on behalf of whom any pretensions were made in respect of telephonic discoveries earlier than Berliner's said caveat, had been thoroughly explored and studied by those whose interests were adverse to the American Bell Telephone Company.

7. In the legal controversies which arose in the Patent Office and in the courts under the said Bell patents and otherwise, all the publications and alleged work of such persons were set up for judicial investigation, and such of them as were thought by their advocates to offer any possibility of success were made the subject of earnest and protracted litigation, so that the early history of speaking telephony and the scientific principles upon which that art depends were litigiously and thoroughly investigated with great and extraordinary fulness.

8. The persons and publications so investigated and considered, for the most part claimed and pretended, or it was on their behalf claimed and pretended, that their early instruments and those on which they relied were speaking microphones. And thus the decision of the Patent Office and the courts in said controversies involved and adversely disposed of the pretensions of the alleged inventors of the microphone other than Berliner, as, for example, the pretensions of Daniel Drawbaugh, James W. McDonough, William L. Voelker, Philip Reis and others. The principal of these suits were before the Supreme Court of the United States in 1887, and are reported in Vol. 126 of the United States Supreme Court reports, to which report, and the reports of the same cases in the various circuit courts, in this court to be produced, reference is hereby made for fuller and greater certainty.

9. In the year 1892, the attention of the Attorney-General of the United States was specifically called to the importance and controlling effect of the variable-pressure telephone invention described and covered by the said Berliner patent 463,569, and particularly by claims 1, 2, 4 and 6 thereof, and it was alleged to him that the said patent, and especially said claims, granted to the American Bell Telephone Company the sole and exclusive right to an invention which in fact and in law the whole people of the United States had a right freely to use; and that said patent was unlawful, illegal and void. Thereupon, with the aid of special counsel and experts and persons skilled in the art, the Attorney-General and his associates examined and caused to be examined the subject, and on February 9, 1893, filed a bill in equity in the name of the United States of America, in the Circuit Court of the United States for the First Circuit, in the District of Massachusetts, against the American Bell Telephone Company and Emile Berliner. In and by said bill he alleged that the said patent was an illegal grant; that it was void; that it unlawfully abridged the rights of the citizens of the United States; that it ought of right to be annulled; and he prayed the Court to repeal and cancel the same, in whole or in part.

10. In and by said bill he averred that the American Bell Telephone Company gave out and claimed that the exclusive right vested in it by said patent, if valid, would secure to it the practical control of commercial telephony in the United States. He also in said bill described the invention in question as operating upon the principle of variations of pressure between electrodes in constant contact, and averred that the said patent, particularly by the said claims, which he styled "broad claims," covered "the feature of constant contact during operation between the electrodes." He said of it that "the feature of constant contact between the electrodes in a telephonic transmitter proved immediately, upon the practical introduction of the art of telephony, to be of great value; that so far as is now known, while other forms of transmitter are practicable for use on very short lines, the constant contact transmitter, or microphone, as it is sometimes called, is the only instrument capable of successful use in the transmission of articulate speech by electricity over such distances and in such situations as those for which the telephone is practically most useful and has hitherto been chiefly used."

11. It further appeared, partly from said bill and more fully from the testimony on both sides, that the transmitters so referred to as the successful and usual transmitters in commercial use, were chiefly or entirely of the forms, styles and specific structures known as the "Blake" or single-contact microphone, in which the contact is composed of two electrodes; and the multiple contact transmitter, in which carbon powder is employed to produce a multitude of contacts as in some forms of the "Edison" style in public use in 1878, and with the powder in a granular form in the "Hunnings" or "Long Distance" style, the latter of which was at and before the filing of the Attorney-General's bill in universal use by the American Bell Telephone Company for the transmission of speech over long distances. Thereupon the Attorney-General's bill averred that "the broad claims of said patent 463,569 cover in their scope every form of constant contact telephonic transmitter which it is possible to make."

12. Among the alleged reasons for the alleged invalidity of the patent the said bill averred that Berliner had never made the invention therein described and claimed by said broad claims; that if he had made it, he was not the first to make it; that neither the instruments of the application nor of the patent were operative for the purposes set forth, or for any useful purpose; that the description in the application was insufficient; that the description in the patent was insufficient; that the right to a patent had been abandoned and lost; and that the proceedings in the Patent Office, and the conduct, both of Berliner and the Bell Co., relative thereto, were of such a character, particularly as regards the length of pendency of the application and the making of amendments thereto, that the Commissioner had no right to issue the patent and should not have done so, and that the grant of it was an illegal, unlawful and void grant. And he also alleged that the patent 238,969, issued on November 2, 1880, to Emile Berliner, and by him assigned to the American Bell Telephone Company, was in fact and in law a patent for the same invention as that for which the patent in suit 463,569 was issued, and exhausted the power of the Commissioner and made the patent 463,569 here in suit unlawful and void.

13. For all which and other reasons more fully set out in said bill a copy of which is here in court to be produced, he prayed for a repeal of the said patent 463,569 in whole or in part.

14. To said bill the American Bell Telephone Company and Emile Berliner duly filed answers declaring the scope of the said Berliner patent to be as in said bill was alleged, denying the alleged invalidity of the patent and the allegations set forth as the grounds thereof, and asserting that Berliner was in fact and in law the true, first and original inventor of said invention, and that the patent was a good and valid grant in the hands of the American Bell Telephone Company and ought to be respected as such.

15. Thereupon evidence was taken at length on both sides and the case was argued and was finally decided against the United States and in favor of the American Bell Telephone Company and Emile Berliner by the Circuit Court of Appeals of the United States for the first circuit, by a decision on the merits, made on May 18, 1895, directing that the bill be dismissed; as will more fully appear from the opinion of said court bearing that date, here in court to be produced.

16. It is a fact and it also appeared by the record in said suit that the attorney-general or his representatives were, when said bill was filed and before the evidence was concluded, fully aware of all the grounds of attack against said patent which in the course of many years of conflict have ever been seriously suggested, and with the preten-

sions of all those who have ever been suggested or alleged as having invented the variable-pressure speaking telephone prior to Berliner. They duly investigated the same, and such of them as were not specifically alleged in said bill nor attempted to be proved in the evidence were so omitted because upon investigation it was believed, concluded and judged by him or his representatives in the case, in the exercise of their official functions and under their official responsibility, that the same were false and unfounded and not worthy of further attention.

17. In said suit (among other matters) it appeared and was either expressly found by the court or admitted by the attorney-general's special counsel at the argument to be matter too clearly proved to be capable of dispute, that Berliner made the invention in controversy before he filed his application; that he was the first to make it; that the description in his original application and the description in the patent were, each of them, sufficient both as regards the structure and the operation of the variable-pressure telephone; that the American Bell Telephone Company and Berliner were lacking in no duty and guilty of no fault in the prosecution of the application; that the invention of the contact transmitter and the invention of the contact receiver were two inventions each capable of supporting a patent; and that said patent either in whole or in part ought not to be cancelled or repealed.

18. It also appeared and was found by the Court that the question of the effect of patent 233,969 on patent 463,569 (the patent in suit) was duly, carefully and elaborately considered by the proper superior officers of the Patent Office, and that, after argument pro and con it was by them adjudged that the patent 233,969 did not destroy or impair the right to the patent 463,569 here in suit.

19. And so the complainant says that the Berliner patent here in suit is and must be taken to be, for the purposes of a preliminary injunction and for all other purposes, a patent the validity of which has been sustained upon a full judicial investigation of its merits.

III.

20. It is a fact, and is stated in the attorney-general's said bill, that down to the date of the filing of said bill no electric speaking telephones of any kind had been used to any considerable extent by any person in the United States except under license from the American Bell Telephone Company and its predecessors in interest, because all other users had been enjoined by the courts in suits brought under the two Bell patents, herein before mentioned, both of which were in force at that date. Subsequently to the expiration of said Bell patents, the defendants herein jointly made, used, offered for sale and sold to others for use variable-pressure constant contact telephone transmitters, embodying the invention, the sole and exclusive use of which was granted to the American Bell Telephone Company by the Berliner patent 463,569 here in suit. They did this, knowing the existence and the said scope of the said Berliner patent, and the pendency of the attorney-general's said suit, but asserting to their customers that they believed that no suit would be brought by the American Bell Telephone Company on the Berliner patent until there had been a decision in the attorney-general's suit, and that, in their opinion, the attorney-general's suit would result in the defeat of the Berliner patent.

21. But since the decision of said suit as aforesaid they still continue to make, use and sell to others to be used such transmitters as aforesaid, falsely giving out and pretending that the result of said suit decides nothing, and asserting that they will not respect said patent and that it ought not to be respected.

22. The defendants, well knowing the premises, but designing and contriving to injure your orator and to deprive your orator of the benefits and advantages arising and accruing from the exclusive possession, exercise and control of the invention and improvements patented in and by the patent No. 463,569, to which your orator has been and is justly and lawfully entitled, have jointly, without the consent and against the will and protest of your orator, within this district and elsewhere within the United States, since the seventeenth day of November, 1891, unlawfully and wrongfully used and furnished to others for use, and caused to be used and to be furnished to others for use, electric speaking telephones, each of which embraces and embodies the inventions and improvements or substantial and material parts thereof described and claimed in the said Berliner patent No. 463,569, and particularly those claimed in each of the claims designated 1, 2, 3, 6, respectively, in the specification of that patent; and still are using and furnishing to others for use such electric speaking telephones, and are causing the same to be used and to be furnished to others for use, in violation and infringement of your orator's exclusive rights in the premises, and threaten and offer to the public to continue so to do; but precisely how long the defendants have used or furnished to others for use such infringing telephones, or caused the same to be used or furnished to others for use, or what number of said infringing electric speaking telephones the defendants have so used or furnished to others for use, or caused to be used or furnished to others for use, your orators are ignorant or want of a discovery, and pray that the defendants be required to disclose and set forth these matters in their answer hereto.

23. Your orator further shows that the telephones so made and sold by the defendants in violation of your orator's rights in the premises, are sold by them to go into all parts of the United States, and into the territory of several and of all of your orator's licensees; that they are small instruments and easily used in private, usually only a few by one person, and easily transferred from one person tô another; that unless the defendants shall be enjoined from further infringements it will be exceedingly difficult and practically impossible for your orator to prevent their infringing use; and further, infringements by the defendants will irreparably damage and injure your orator, and depreciate or destroy the value of the exclusive franchise to which your orator is entitled under the patent aforesaid, and will grievously injure both your orator and its licensees in their said business and will deprive each of them of benefits and advantages for the loss of which there exists no adequate legal remedy.

24. Your orator further shows that, in addition to the relief herein sought against the defendants, they are likewise entitled to restrain each and every user of any infringing telephone or telephones which have been or shall be furnished or disposed of by the defendants in violation of your orator's exclusive rights in the premises, and to recover and collect from each user thereof a suitable sum of money, as and for damages and profits in consequence and growing out of such use; and your orator, notwithstanding any proceedings in this cause, does not waive any rights or remedies which it may have against each and every person who has or shall have used any of the said infringing telephones, but wholly insists upon its said rights and remedies, and avers and asserts that it intends to pursue and enforce the same against every such user; but your orator further avers that the defendants are also liable to pay to your orator other sums of money as and for profits by them actually realized, and as and for damages by them directly caused to your orator by reason of their said infringements and unlawful acts.

25. The principal and substantially the entire business of the defendant corporation since March 7, 1893, has been the manufacture and sale of telephones which embody the said Berliner invention patented by the patent in suit, and it is pecuniarily irresponsible and unable to respond to a decree for damages in favor of the complainant in this suit.

During all the time of the infringements herein complained of, the defendant Emery has been and now is the president and a director of said company, and the defendant Leatherbee has been and now is the treasurer and a director of said company, and the said two defendants during all said time have been and now constitute a majority of the directors of said corporation and have been and are its managing and controlling officers; said Roberts has also been and is a director thereof. Said Boardman has been and now is the "electrician" of said company, and has personally devised some of the details of said infringing instruments, and has personally constructed them or supervised and directed their construction.

Each of them is also largely interested in the infringing business carried on by said National Telephone Manufacturing Corporation, and in the profits thereof, and has personally and actively committed, caused, promoted, maintained and participated in the said infringements upon the exclusive rights secured to your orator by said Berliner patent as aforesaid, and has shared and intended to share in the profits and benefits arising and accruing therefrom.

IV.

26. To the end, therefore, that the defendants may, if they can, show why your orator should not have the relief herein prayed, and may, according to their best and utmost knowledge, remembrance, information and belief, but not under oath, which is hereby expressly waived, full, true, direct and perfect answer make to the matters hereinbefore stated and charged, and more especially may answer, discover, and set forth whether during any and what period of time, and whether within this district or elsewhere, and when and where they or either of them used the said improvements or either of them, and how the said telephones made or used or sold by them and the several parts of the same are constructed and used.

And that the defendants may be decreed to account for and pay over to your orator all such gains and profits as have, and shall have, resulted and accrued to them from the said unlawful using or furnishing to others for use of electric speaking telephones embracing or embodying the invention and improvements or any material and substantial part thereof, set forth and claimed in said patent No. 463,569; and that, in addition to the said profits to be so accounted for, the defendants may also be decreed to pay your orator the damages which your orator has sustained by reason of the said violation and infringement of its exclusive rights aforesaid, and which this Honorable Court may assess or cause to be assessed, together with such increase thereof as your Honors may see fit to adjudge.

And that the defendants, their attorneys, agents, workmen, servants and confederates may be perpetually enjoined and restrained by the decree of this Honorable Court from directly or indirectly making, using, furnishing to others for use, or selling any electric speaking telephones or telephonic apparatus whatsoever embracing and embodying the invention and improvements, or any material and substantial part thereof, set forth and claimed in said patent No. 463,569.

And that the defendants may likewise be restrained and enjoined to the same effect while this cause is proceeding to final order and decree.

And that the defendants may be further decreed to pay the costs of this suit.

And that your orator may have such other relief as the equity of this case may require, and as your Honors may deem to be just and right.

27. May it please your Honors to grant unto your orator a writ of injunction conformable to the prayer of this bill, and an injunction *pendente lite* to the same effect, until further order, and also a writ of *subpœna* directed to the said defendants, the National Telephone Manufacturing Company, at Boston, Massachusetts, James D. Leatherbee, of South Braintree, Massachusetts, Woodward Emery, of Cambridge, Massachusetts, Stillman K. Roberts, of Malden, Massachusetts, and Arthur F. Boardman, of Somerville, Massachusetts, commanding them and each of them to appear and answer unto this bill of complaint, and to do and to receive what to your Honors shall seem meet in the premises.

THE AMERICAN BELL TELEPHONE COMPANY,
By JOHN E. HUDSON, President.

James J. Storrow; Fish, Richardson & Storrow, Solicitors and of Counsel for Complainant.

The Citizens' Telephone and Electric Company, recently organized at Hoboken, N. J., with William H. Ellis president, John Ryan secretary, has applied for permission to construct subways and conduits in certain streets. If the franchise is granted, the company will reduce telephone rates to less than one-half the present charges.

A telephone line is being put up between Atlanta and Rome, Ga., which when completed will connect that city with nearly all the large cities in that State, among them Macon, Columbus and Augusta. The line will be completed by September 1. It is probable that it will be extended to Chattanooga very soon.

The Pennsylvania Telephone Company has been granted a franchise at West Bethlehem, Pa., conditioned upon the maintenance by the company of a fire alarm system and free telephones for the borough's use.

The Spartanburg Telephone Company, a local company which has been organized at Spartanburg, S. C., to compete with the Bell Company, is now arranging to put up poles and wires. The capital stock is placed at $10,000. The company has already secured 165 subscribers on five-year contracts.

The Central Bell Company has been notified to remove its telephones from the county offices in Toledo, Ohio. A contract has been made with the Harrison Company for local exchange service.

State Senator Rourke, of Rawson County, N. D., is interested in the proposed constructon of a telephone line from Lisbon to Fargo, that State, to make connection with the Fargo and Grand Rapids line of the Northwestern Telephone Exchange.

The Rahway Telephone Company, lately granted franchise at Norfolk, Va., is canvassing for subscribers.

Fred Kraus, of Milwaukee, has asked for a telephone franchise at Menasha, Wis.

The Southern New England Telephone Company has applied for underground privileges at Willimantic, Conn.

A telephone line is to be constructed between Morrison and Sterling, Ill.

The telephone line between Galesville, Wis., and Winona, Minn., will be extended to Ettrick, Wis., at an early date.

Fairfield and Mount Erie, Ill., are to be connected by a new telephone line eighteen miles long.

Underground rights have been granted to the Southeastern Telephone Company at Brockton, Mass.

The Phœnix Interior Telephone Company, 131 Liberty street, New York, has closed contracts during the past week for upwards of 400 telephones.

A company with a capital stock of $10,000 is being organized at Scranton Pa., to install a telephone exchange system in that city.

Herman de Laguna has applied for a telephone franchise in Los Angeles, Cal., offering to build underground conduit system in a restricted district; to pay 1 per cent. of his gross receipts to city annually and to furnish to the city departments fifty telephones free of charge during the life of his franchise.

ELECTRICITY.

VOL. IX. NEW YORK, SEPTEMBER 4, 1895. No. 8

ELECTRICITY

Published every Wednesday by the
ELECTRICITY NEWSPAPER CO.
S. E. GREENE, PRES'T. L. J. MONTGOMERY, SEC'Y.

PUBLICATION OFFICE:
6 Park Place - New York

EDITORS: { NELSON W. PERRY.
BURTON E. GREENE.
R. H. WILLOUGHBY.

BUSINESS MANAGER, - - JOHN L. GANS.

SUBSCRIPTION RATES:

UNITED STATES,	$2.50
IN CLUBS OF FIVE OR MORE,	$2.00
FOREIGN COUNTRIES,	$4.50
SINGLE COPIES,	10 CENTS

ADVERTISING RATES:

As ELECTRICITY reaches all classes interested in electrical work, its value as an advertising medium can be readily appreciated. Rates will be sent on application.

Changes for advertisements should reach the office not later than the Saturday preceding the date of publication.

ENTERED AT THE N. Y. POST OFFICE AS MAIL MATTER OF THE SECOND-CLASS.

TRADE SUPPLIED BY

EDITORIAL NOTES.

There are still left in this trade a large number of men who have entered into it for their life work. They may be disheartened, but they have not given up. It is for them that we write. To them we present our argument, and to them we must all look for the re-establishment of business principles, the reinforcement of the doctrines of common sense.

It is for these men to consider just why wrong has temporarily triumphed over right, why it was possible for the tricksters and adventurers to bring the industry to its present condition.

And when these questions receive careful thought the only answer possible is that the electrical press has not done its duty.

If the "Electrical Engineer," the "Electrical World," the "Electrical Review" and the "Western Electrician" had faithfully done their duty by the trade they claim to represent, whose best interests they claim to guard, the present situation would never have confronted us.—" ELECTRICITY," June 5, 1895.

The Problem of the Brake Upon the Trolley Car. Our esteemed contemporary, the *American Machinist*, in reply to an editorial in a recent issue of this paper, says that the question at issue is *not* whether the electrical journals have published anything on "brakes," but "the perplexing problem of *how to operate* the brake upon the electric car so that an electrically propelled car shall be as safe as any other so far as the stopping of it is concerned." . . . "It would be a great relief to our minds, and a great assurance of safety to the general public, if any one would assert and prove that it is not true, as we asserted, that an electrically driven car upon a street railway, a trolley car. either an overhead trolley or an underground trolley, and especially and for an additional reason, a car operated by a storage battery, cannot either of them, *with safety to itself*, be stopped as quickly as any other car of the same capacity, and running at the same speed."

The burden of our contemporary's argument seems to be that the brake on an electric car is purposely made slow to avoid injury to the car; and after making the assertion that it is, asks us to disprove the assertion. This is indeed begging the question, for the burden of proof certainly lies with the "allegator." It has never occurred to us, nor do we believe that it has ever occurred to any of the manufacturers of electric cars, that the brakes were made slow-acting to save the machinery of the cars. Such an idea is to us absurd in the extreme, and if the *American Machinist* has any valid reason for thinking that this is true it seems to us high time that it should declare its reasons. They are necessarily somewhat slow of action for the same reason that the old hand brakes on the steam roads were and are slow acting—solely and simply because they are hand brakes, and not for the purpose of saving the machinery. The air brake has largely supplanted the hand brake on steam roads, and was also employed on the Intramural, but has not found favor on street cars, either cable or electric, for various reasons—but the one suggested is certainly not one of them.

One of the chief virtues of the air brake is that it can be applied almost simultaneously to all the wheels of a long train. Where there are but four wheels, as in the ordinary street car, and these can be braked simultaneously from one point, the requirements are fairly well met by the present hand brake. Not very long ago a paper was read by Mr. Elmer Sperry before the Institute on an electric brake. This and other electric brakes have been assiduously exploited in the market but have failed of general favor—not so much because they failed to accomplish what was claimed for them as because there has not yet arisen any apparent need for them. We believe that it has been very fairly demonstrated that a four-wheeled car, for instance, can be brought to a standstill within a space so short by the hand brake that neither the air brake nor the electric brake could do much better. and that the difference in favor of the two latter is more than counterbalanced by certain disadvantages inherent in them. A cable car is by no means as heavy as a motor car, nor is there a cable line anywhere in the country running at as great a speed as electric cars are habitually driven. We think also that there is no question at all but that an electric car, notwithstanding its greater weight, can be stopped more quickly than can a cable car, and that all it requires with its present braking facilities is that those facilities should be applied intelligently. A cable car cannot back out, nor rely upon anything to stop its course but the adhesion of the wheels on the track. With the electric car as with the steam locomotive the wheels may be reversed as soon as the speed is reduced so that this may be done without skidding. The storage battery car is more difficult to stop than the trolley if both are at the same speed, simply because the storage battery car weighs just about twice as much as the heaviest cable car.

The greatest trouble, in our opinion, with the braking facilities of our electric cars is that the motorman has too much to do already. He has the controlling lever in one hand, the brake lever in the other, a reversing switch, which we suppose he is expected to control with his teeth while he blows a whistle with his mouth, a bell push to occupy one of his feet and the pawl on the brake ratchet which his other foot is in, tended to control and a sand valve thot must be operated somehow. There is a canopy switch also which, if he be very tall and sprightly, he might work with the top of his head. Now, supposing we add an emergency brake or two, as the *American Machinist* would have us do, that would have to be controlled in the same way that the one-armed fifer held his fife while passing his hat for alms, and this, we think, would not be an effective method of control.

* * *

Grand Transmission Scheme at Goose Pond. High among the forest-crowned hills of western Massachusetts lies a pretty sheet of water of about 250 acres area, bearing the romantic appellation of Goose Pond. It feeds a little trout-stream which tumbles somewhat precipitately over a stony bed for a distance of three or four miles, and finds its way into the Housatonic in the town of Lee, furnishing along its course somewhat uncertain water power to half-a-dozen small manufacturing establishments. A few days since the local newspaper of the vicinity came out with startling headlines, followed by a column article containing many interesting particulars respecting "a great scheme" which was on foot for developing the almost limitless resources of Goose Pond in the way of power, to be distributed by electric motors to the manufacturers of Lee. "The plan," says the local reporter, "was suggested by a Mr. Upton, who was here in the interest of the Standard Thermometer Company which manufactures arc lamps. In conversation with the manufacturers on the Goose Pond stream he suggested the advantages of the above plan." The water, we are told, is to be carried three miles in a pipe and then delivered through an inch-and-a-half nozzle to a 15-inch Pelton wheel, under a head of 600 feet, "furnishing at a low estimate 2,000 horse power night and day during the entire year." Mr. Upton estimates that a plant of 2,000 horse power capacity might be furnished for about $75,000, or of half that power for $50,000, and that it could be operated at an expense of about $10,000 per annum, including fixed charges. As steam power is estimated to be worth $40 per horse power per year in Lee, "it can easily be seen," says the reporter, "that the scheme, if successfully carried out, would prove enormously profitable"—possibly as profitable as the local electric light plant established by the Thomson-Houston Company, respecting which Electricity gave some interesting statistics a few weeks since. "To those who know what has been accomplished in harnessing the mighty forces of Niagara, and what science is doing in other directions," continues the reporter, "this can hardly appear incredible. If the statements above can be relied upon, and they undoubtedly can, as Mr. Upton is thoroughly conversant with the subject, there is certainly no apparent reason why the plan cannot be carried out."

Some account of this project having been published in the *Springfield Republican*, Mr. F. L. Pope, who appears to be familiar with the topography of the Goose Pond district, in a letter to that journal calls attention to the fact that the water-shed of Goose Pond has an area of only some four square miles, and says that if all the water that falls on that area during the year were stored and utilized (a thing which is probably impracticable), the utmost amount that could be utilized for consumption in a dry year would be about 261 horse power, instead of the 2,000 reported to have been figured out by Mr. Upton. The manufacturers of Lee, it appears, have held a meeting and have appointed a committee to consider the matter. They had better go slow; if they should decide to invest $75,000 in a transmission plant and then find that they could only get 261 horse power, they might, after due consideration, be disposed to think that the time-honored appellation of their storage reservoir had not been bestowed wholly without prophetic significance.

Under the Searchlight.

Views and Opinions on Timely Topics.

Lost, Strayed, Stolen or Skedaddled—A Street Railway Company.

While in the Northwest recently, a member of the staff of Electricity made some effort to find the St. Cloud Street Car Company, but learned at once that the search was not likely to be successful, as several other interested parties have been looking for it since January last. The affairs of this company were recently reviewed in Electricity. There was $100,000 stock and $100,000 bonds issued, but out of the proceeds no power house was provided, the power having been rented from the local lighting company. One of the stockholders of the latter company, a substantial citizen of St. Paul, Chas. S. Benson, has been manager of the street railway property, being engaged by Mr. Byllesby. The street railway company now owes the lighting company upwards of $4,000 for power. In January of this year, when the General Electric interests fled from St. Paul in the night, Mr. Benson was told to apply the receipts to operating expenses, and to go ahead and run the system, as there was no one to remit to. The receipts have been just about enough to pay the wages account. In June the main part of the property of the company, located in St. Cloud, Stearns Co., was sold for taxes, and was purchased by interests friendly to Benson. A director of the lighting company has visited the East, and been informed by Messrs. Coffin, Byllesby, Levis and others that they do not know who owns the stock of the company. This stock was all issued originally to the Northwest General Electric Company. Early this month the St. Paul Title Insurance and Trust Company, as trustee of the bonds, applied for a receiver, and asked that Mr. A. S. Huey be appointed. They refused to give up the names of the owners of the bonds. Mr. Huey, being an employee of the General Electric Company, was not acceptable to the lighting company in St. Cloud. They, therefore, asked the Court to appoint Mr. E. E. Clarke, Assistant Cashier of the First National Bank of St. Cloud. The Court granted their request on August 9. So far Mr. Clarke has received nothing, and it is doubtful if he ever will. The lighting company refused to turn over the property until their claim is paid, and the man who bought it in for taxes also thinks he has a pretty good claim on it, but either of these parties would willingly give up the system if they could get their pay. In fact, if they do not find the owners, they are likely to run the cars into the river and sell the track as junk, because the ownership of the system, if it also entails the expense of operation, would be a positive misfortune to anyone. The company owns six cars, three of which are sick. If this notice shall attract the attention of the actual owners of the system, we hope they will come forward and claim their property.

* * *

The Fort Clark Street Railway (Peoria, Ill.) Company's property has just been sold by the receiver to the Central Railway Company of the same place. The city of Peoria has a population of 41,024. The aggregate capitalization of the two systems was $1,550,000, as against $615,000, the limit allowable according to the ordinary rules of honesty. The Ft. Clark property was entirely a General Electric enterprise. There was an authorized issue of $500,000 stock, of which $177,750 is held by the General Electric Company as an asset. Of the $250,000 bonds, $50,000 were turned over to the Street Railway and Illuminating Properties and the remainder sold to other investors.

* * *

Financial News.

The *Electrical World* sustains the reputation it has made in discussing electrical finances from week to week. A few months ago, it will be remembered, the *World* announced in behalf of its master, the General Electric Company, that the loss of the Edison feeder and main patent was offset by a great victory over the Universal Electric Company of Cleveland on incandescent lamps about two weeks before the Edison lamp patent was declared to be expired by the United States Supreme Court.

Last week our abject and servile contemporary said:

> Electric Storage Battery continues strong and active; on Thursday the stock reached its highest point this year, selling up to 46. Later on, however, selling to realize profits, by those who had previously picked up some of the stock at low figures, caused a reaction to 45. The stock appears to have come into marked favor on the Philadelphia Exchange for both speculative and investment purposes, probably owing to the rather advantageous position of the company as regards volume of business and control of patents.

Will Mr. W. J. Johnston, the proprietor and editor of the *Electrical World*, explain just what is meant by the last sentence in the above paragraph?

Does he know—

1. That the capital stock of this concern is $13,500,000?

2. That about half of this amount is represented by "patents"?

3. That there has not been, in the history of the storage battery business, one year in which the gross business done in America amounted to $200,000?

4. That the best informed storage battery men in this country state with positiveness that the gross annual output can scarcely reach $250,000 in the next five years?

This is just about one-fiftieth part of the business the company need to do to pay dividends on their stock, unless, indeed, they pay dividends out of the proceeds of the sale of more stock—a plan not entirely unknown to the promoters of the Electric Storage Battery Company.

Would Mr. W. J. Johnston invest one dollar of his own money in this scheme?

If not, does he consider himself an honest man, or his paper an honest paper when it assists the promoters to gather in the money of investors not so well informed?

* * *

On August 25 a meeting of various heads of departments, etc., was held at the Harrison lamp works, to glorify Lieut. Ayres for his magnificent conduct of that establishment. The general tone of the comment was that the Lieutenant had dropped down at Harrison as a special dispensation of Providence. Especially was his great "system" praised. The next day an order came in for a few thousand lamps of a certain voltage, which could not be filled though the Lieutenant had reported that there were 300,000 of them in stock.

* * *

News comes from Washington that the law officers of the Government have decided to prosecute further the case of the Government against the Bell Telephone Company, recently decided in favor of the Bell Company. So far as we can learn, the only telephone company in America which wants the Government to continue this litigation is the American Bell Telephone Company.

* * *

Another Fixture Combine.

Not satisfied with the knockout he received two years ago in a similar attempt, Mr. C. M. Biddle, of Philadelphia, is trying to form another combination in the fixture business. The corporate name is the Gas and Electric Light Manufacturers' Association, and the officers are: President, John H. Selmes, of the Mitchell-Vance Company; vice-president, H. C. Beck, of the Vosburg Manufacturing Company, of Brooklyn; secretary, A. M. Thackara, of the Thackara Manufacturing Company, of Philadelphia; treasurer, J. A. Cunningham, of the Brooklyn Gas Fixture Company.

"*As a voltage of* 10,000 *has proved to be entirely practicable, a territory within a circle of* 100 *miles diameter can be as easily served from a central point as can one town from its own plant employing the usual voltage.*"—Electrical World.

* * *

An Appreciative Contemporary.

"Electricity's" Special Merits as an Advertising Medium.

(From the Electrical Engineer.)

ELECTRICITY has been called upon in innumerable ways by the enterprising advertiser to catch the eye of the public, and invariably with success.

* * *

A ST. LOUIS paper tells of a horseless vehicle which has been seen on the streets of that city "in the still hours of the night." It is the invention of a 21-year-old boy named Perry Lewis. "It flew up Lucas avenue at the rate of 15 miles an hour, and when it struck a big hill it climbed it with ease."

The contrivance is a high two-seated rig. Under the seats are 30 storage batteries, which are loaded through a chloride accumulator. The motor is an invention of Lewis's. He calls it a quadrupler. It consists of a big armature surrounded by four secondary coils. With this is connected a ratchet wheel that fits into a large cogged wheel, built solid with the axle. It takes 10 hours to store the batteries and they are then capable of running the vehicle at a speed of 12 miles an hour for 4 hours.

* * *

Who Knows Anything About This?

To the Editor of ELECTRICITY.

DEAR SIR: Why don't you make inquiries about the collections made of poor working people at Schenectady to pay for the street which the General Electric Company wants? Poor working girls are told to give so that they may not lose a chance to make a living. It's rotten.

* * *

THE *Electrical World* had last week 32 pages of advertising matter, exclusive of its own, 15 per cent. of which was from concerns unable to pay their bills. The *Electrical Engineer* had 23 pages. This is an average drop for both papers of 50 per cent. from the time when they were called upon to do their duty by the trade which they falsely claim to represent.

What Mr. Coffin Never Forgot.

(From the Washington Star.)

"Now, John," said Mrs. Porque to the new gardener, "I hope you will remember all that I have told you. And whatever you do, don't forget to water the electric light plant."

The Electropoise.

Methods of the Promoters Abroad.

(From Science Siftings, London.)

On December 14, 1893, an auspicious visit was paid to the office of *Science Siftings* by a person who expressed the desire to interview the editor, and whose business card described him as being "Mr. R. Bourne," the representative of the Electropoise Company, of London and Brighton. Bourne was forthwith gratified, inasmuch as he stated that he called at the suggestion of Mr. T. E. Gatehouse of the *Electrical Review*—a gentleman who, as our readers well know, has rendered yeoman's service in the exposure of "electric" quackery.

Bourne explained that his mission was to obtain a thoroughly reliable scientific opinion upon what he described, with unfeigned zeal, as a most marvellous appliance (not electrical) for the cure of disease—to wit, the "Electropoise." Curiosity is largely ascribed to the gentler sex, but be it confessed that the editorial chair immediately became vacant when a small box was produced by Bourne containing the latest candidate for public favor in the field of quackery.

The "Electropoise," which is priced to the public at five guineas, was produced for inspection, and its appearance is thus described without color or disparagement: A nickeled metal cylinder about three inches in length by one inch in diameter. The head of the cylinder has alength of about twelve feet of scarlet cord (the color is sometimes varied), through which run some strands of tinsel. At the end of the cord is a piece of elastic webbing, and attached to this is a small metallic buckle, so that the webbing may be utilized as a wristlet or anklet. The patient is to recline in a reposing position and place the webbing round the wrist or ankle and thus attain perfect health.

The most elementary knowledge of science makes it apparent that such a construction could not permit of the generation of any known force, be it electrical or otherwise, there being but *one* attachment to the cylinder.

It would be puerile to detail the testimony volunteered by Bourne as to the "efficacy" of his appliance, even when it was pointed out that his assertions could not possibly be well founded. It was patent, however, that the agent of the Electropoise Company had been gulled by his principals, and that Bourne was simply an ignorant, enthusiastic subordinate—at once a dupe and an instrument. He admitted that he had no knowledge of either science or pathology, although his duty was to see and examine patients. When further questioned he stated that he obtained from the patients the diagnosis of their doctor, failing which he expressed himself as possessing the knack of arriving at the nature of the diseases or disorders with which the patrons of the "Electropoise" were affected. Bourne handed over the "Electropoise" for inspection, together with a pamphlet and a book of directions for using it, for perusal, and departed, observing that *Science Siftings* would receive a further communication from his principals.

This is the story of the man whose functions are to advertise and sell the "Electropoise" in this country and advises upon the treatment of cancer, Bright's disease, cholera, diphtheria, ovarian tumors and a host of other fearful and often fatal maladies. The wickedness and fraud of the employers of Bourne have no bounds, for in plain type the intervention of a medical man is inhibited. The "Electropoise" alone is to decide the issue of life or death Forsooth it *cures without medication*. This fraudulent instrument bears everything on its surface save the contents of the cylinder; clearly the cord and webbing are pure negations. The cylinder has been broken and examined—its contents analyzed. It is loaded with plumbago mixed with sulphur. This combination has been chosen probably because it is one of the cheapest forms of ballast that could be poured into the cylinder when in liquid or molten form. Observe the language of "Electropoise" charlatans, who thus describe their crude and impertinent imposition: "It consists of a cylinder, called a 'Polarizer,' filled with imperishable materials, combined, after *years of study and experiment*, to produce the best possible results."

A scarlet pamphlet expatiates on this device vended at £5 5s. 0d., and which has been thus assessed by a well-known fancy goods dealer in the City of London: "If this article were *amusing* or *useful* I would price it in my establishments as a shilling line." The pamphlet referred to on its blushing cover thus announces the utility and capability of the "Electropoise":

THE NEW ERA.

The
ELECTROPOISE
CURES

Bright's disease,
Chronic catarrh,
Constipation,
Consumption,
Diphtheria,
Dropsy,
Dyspepsia,
Heart disease,
Insomnia,
Locomotor Ataxia,
Nervous prostration
Paralysis,
Rheumatism,
Varicose veins,

And all other Curable Diseases,
Without Medicine or Electricity.

Electropoise offices, 263 Oxford St., W. (close to Oxford Circus), *4 North St., Quadrant, Brighton.*

What we assert is that these are tissues of deliberately and wickedly false representations. The "Electropoise" never has cured nor will it ever cure or affect any ailment which has ever befallen mankind; and no one is better aware of the fact than its scheming promoters that it is an impudent juggle of expert American sharpers, who imagine that the English Press has its price for aught and everything. Interleafed in this pamphlet containing a variety of Press notices is a lithograph of a letter written on four sheets, bearing a crest and purporting to emanate from the Rev. J. Edmond Long, Incumbent of Holy Trinity, New Charlton, S.E.

Are those responsible for the Press notices to which we refer or is the reverend gentleman we name aware that puffing a fraudulent quack remedy of the vilest description even innocently, or rather ignorantly, is conduct which cannot commend itself to any thoughtful man? Think of perchance a poor cancer-stricken woman with slender purse being led by her paper or the reference of the man of God to visit 263 Oxford street. We know where the responsibility begins, but the question is where does it end.

The most efficacious manner of unmasking the authors of the "Electropoise" fraud is to publish the following extract from a letter received by *Science Siftings*, headed "1405 New York Avenue, Washington, D. C." (we commend this address to the American Police), and dated January 4, 1894. . . . "The past seven years of my life have been devoted to the introduction and sale of the Electropoise. . . *Not being a scientific man*, I have been content heretofore, having my hands full of business, to know that the thing would cure disease, and with it to effect cures heretofore unknown to men. The time has arrived that we are anxious to know the scientific basis for this action. . . I shall be glad to give you all the information in my power and am sure that a *fair* investigation will show you that it is what we claim and open the way to an arrangement by which both of us can make some money.—Awaiting your favors, I am, yours truly, JOHN N. WEBB, President."

What does this letter of grammatical gaps mean? Can there be any doubt whatever about the fact of John N. Webb's barefaced attempt to bribe *Science Siftings*, knowing the part it has taken in the unveiling of Quacks. *Science Siftings* replies not by letter but by this article, respectfully declining to make some or any money in conjunction with a man who seems to be a candidate ripe for the felon's dock.

To pretend that diphtheria, cancer, or heart disease can be cured by wearing an elastic wristlet attached by a cord to a piece of metal is surely criminal, when the pretence is made with intent to obtain money. Further than this, can a parallel be found to the heartless villany that suggests that this device will resuscitate a drowning man, when the precious moments thus lost would certainly render recovery impossible? One can readily appreciate the existence of lynch law in the Far West, but the astute Mr. Webb spins his web in Washington, where we sincerely trust he may remain and cure snake bites and small-pox, as set forth on page 232 of his interesting literary production, bearing the title of "Plain Directions for Using the Electropoise." John N. Webb has at least played one meritorious part in his life story, for he has contributed a moral lesson of no mean value as a weapon in the Quack Crusade.

WATER-POWER APPLIED BY ELECTRICITY TO GOLD-DREDGING.*

BY ROBERT HAY.

In many mining districts there are deposits of gold which cannot be worked owing to the difficulties of transport and the dearth of fuel. The application of water-power transmitted to a distance by electricity is, therefore, a subject which may well command attention in well-watered countries like New Zealand, where a plentiful supply of power is obtainable, for intervening hills and valleys form no obstacle to its transmission, there being few districts through which light wires and poles cannot be easily carried.

The plant described in this paper is the first of its kind constructed in New Zealand. It was designed by the author for gold-dredging on the River Shotover, at a point about 30 miles from its confluence with Kawarau River and 2 miles from Queenstown, a small town situated on Lake Wakatipu, which lies about 1,000 feet above sea-level. The Shotover runs through rugged and inhospitable country, generally in precipitous rocky gorges, and is only accessible by tracks cut down the leading spurs and gullies. Since the dredge commenced operations, however, a mountain road has been constructed at a considerable elevation above the river, and extends some 20 miles towards the Upper Shotover dredging-ground, opening up to some extent the interior of that part of the country.

All the bucket-grab and suction dredges hitherto employed in New Zealand have been actuated by steam power; bituminous coal, lignite or firewood usually being fairly plentiful, and accordingly moderate in cost. In the case referred to, however, fuel could only be obtained at prohibitive prices, as it would have been necessary to transport it to the dredge for long distances over the mountain tracks on the backs of horses. Water power in a convenient form was found to be available at a branch creek, but for many reasons it could not be applied directly to dredging. It was therefore decided to transmit the water-power by electricity to the dredge in whatever part of the river it might be working.

The water was obtained from a creek 1½ miles distant, and was brought, by a race cut in the side of the hill, or, through places where the ground was too precipitous or loose to carry the race, by a timber flume, to a pressure-tank situated at a point 524 ft. above the generator-house. The race is 2 ft. 6 in. deep, and 3 ft. wide at the bottom, and the sides are cut with slopes of 2 in 1. The flume is rectangular in cross-section, 2 ft. deep and 3 ft. wide, and in places where it could not be wholly set in a cutting along the side of the hill, is carried upon trestles standing about 6 ft. apart. The pressure-tank is 20 ft. long and 12 ft. wide at the bottom, and has sides with slopes of 1 in 1 and 2 in 1. The water passes from the pressure tank through a bell-mouth covered by a wrought-iron grid, and is carried in steel pipes to the generator-house.

The pipes are of rolled steel of 16 and 11 B. W. G., with double-riveted longitudinal seams and single-riveted circular seams with 1½ inch lap. The pipes are each 19 ft. 6 in. long over all, and are jointed with wrought angle-iron flanges riveted to the pipes. The internal diameter of the main pipe is 14½ inches.

The quantity of water available in ordinary seasons is 240 cubic feet per minute; but in dry weather, after a fine winter, when the snowfall has been light, the supply falls to about half that quantity. This, however, is sufficient to develop the necessary power.

The generator-house is situated about midway between the ends of the portion of the river to be worked, which is about 4 miles long. The prime mover at the generator house is a 4-foot Pelton water wheel, on the buckets of which the water impinges from a 1½ inch nozzle at a pressure, in the pipes outside the station, of 228 lbs. per square inch. The Pelton wheel drives by belt two Brush-Victoria series wound dynamos which, when working at their normal speed of 700 revolutions per minute, give each an electromotive force of 650 volts and a current of 40 amperes, or together a total electrical output of nearly 70 H. P. The two dynamos are coupled in series. A Buss-Sombart tachometer, driven from the armature shaft of one of the dynamos, indicates their speed, while a Soames-Nalder amperemeter and a Cardew voltmeter (the latter reading up to 1,400 volts) indicate the current and electromotive force respectively. The Pelton wheel has no automatic regulator, as the work required of it is fairly constant. It was necessary, however, to provide against the possibility of an abnormal increase of current, due either to accidental short-circuiting of the line wired or to the sudden arrest of one of the motors, which might result in damage to the generator armatures, and to provide also against racing of the Pelton wheel and dynamo, which would take place if the circuit was broken or the load suddenly thrown off one of the motors by a belt leaving the pulley. This has been accomplished in the following manner. Two electro-magnetic switches are placed in circuit with the dynamos and motors, and are so adjusted that, in the event of the current increasing to three amperes above its normal amount, one of them, and in the event of it decreasing to three amperes below it, the other one, disconnects the line and motors from the circuit and throws into it in their place a set of iron-wire resistance coils, constituting an artificial load of the normal amount. If anything occurs to the line or motors to cause an abnormal increase or decrease of current, the dynamos are therefore automatically protected, and continue to work as if nothing unusual had occurred. When either of the switches comes into action, an electric bell calls the attention of the attendant. The contrivance has been found to answer well in practice, and has on several occasions saved the dynamos from the risk of damage.

The conductors between the station and the dredge form a completely metallic circuit, and consist of bare copper wire of No. 4 S. W. G., supported upon Johnson-Phillip fluid insulators. The supports are old 40 lb. rails, with a short hard-wood cross-arm bolted to each about 2 ft. from the top. This arm carried the insulators for the conductors, while a third insulator, bolted to the top of the rail, carried a telephone wire connecting the generator-house with the dredge, the length of line being about two miles. Between the ends of the conductors on the bank and the motors in the dredge, the two cables consist of seven No. 16 copper wires, and are heavily insulated with vulcanized indiarubber. The shore ends are clamped to the conductors near to one of the poles, a supplementary pole having to be used occasionally when the river bed is too wide to admit of a single span to the dredge. The other ends of the cable pass over insulated pulley-blocks, and are coiled upon a drum so that they can be drawn in or slacked out as the dredge moves towards or from the shore.

The electric motors, of which there are two, are also arranged in series, and are exact duplicates of the dynamos; the object being to make the various parts of the machinery interchangeable and to avoid a multiplicity of spare apparatus. A spare armature and field magnet are provided which will fit any one of the machines. One motor drives directly, through a belt, a centrifugal pump, whilst the other, geared to an intermediate shaft, drives the buckets, winches, and revolving cylinder of the dredge. As it is sometimes necessary to vary the speed or to stop the motor that works the buckets, a variable iron-wire resistance is provided by which its field-magnet coils can be shunted. The motor that drives the pump acts as a current regulator, for, when the bucket motor is switched off, or its speed varied, the pump motor absorbs the surplus electrical energy—revolving faster and causing the pump to throw more water, which, however, does not cause inconvenience. By this means great simplification in the working of the plant is attained—an important factor when electrical apparatus is placed in the charge of unskilled hands.

The frames and plating of the dredge, which is 80 ft. long and 20 ft. wide, are entirely of steel, and where possible all the framing, ladders, buckets, etc., are made of the same material. The buckets, which have each a capacity of 3½ cubic feet, are filled and discharged at the rate of about twelve a minute. This gives a lifting capacity while dredging to depth of 20 ft. of more than 90 cubic yards per hour, which is as large a quantity as can be economically treated on the tables for gold-saving purposes. The winches have separate barrels for the quarter, head, and hoisting lines, which are of steel wire, and each barrel is driven by a large worm-wheel. A vertical shaft carrying a worm-wheel is connected with bevel-wheels below the neck, which are provided with friction clutches so arranged that the barrels can be thrown in or out of gear by moving the winch handle to one side or the other, all the winches being driven by a shaft below the deck. The dredgings, boulders and gravel are delivered into a revolving cylinder 10 ft. long, constructed of bars set ½ in. apart. Through these bars the gold and finer sand pass on to the tables, the stones and debris being retained and afterwards discharged direct into the river through the stone-shoot. The tables are set at an inclination of 1 in 12, and are covered with baize upon which the gold is caught. The cloths are washed in tubs at intervals of eight hours, and are then replaced on the tables. A 16½ in. centrifugal pump, driven at a speed of 600 revolutions per minute, and with a lift of 16 ft. from the water-level, supplies about 2,000 gallons of water per minute to the revolving cylinder.

The dredger is lighted by two 10-ampere Brush arc-lamps, included in the power circuit in multiple series with the motors. They are controlled from a small switchboard on the vessel. A resistance-coil to take 20 amperes is arranged as a shunt on the lamps, while the remaining 20 amperes are divided equally between two circuits, in each of which an arc-lamp is placed. The switches are arranged so that if one of the lamps is switched off an equivalent resistance is thrown into the circuit in its place, the current in the circuit of the other lamp remaining unaltered. When the lamp is switched off it is entirely disconnected from the power circuit, so that it may be touched without danger of unpleasant shock. A third switch disconnects the resistances and lamps from the power circuit during the daytime, when the lamps are not required.

The full available output of the plant is not utilized, and a reserve of power is always maintained. The working duties of the plant as observed are:

Pressure of water in the pipes	228 lbs. per sq. inch.
" " at the valve	195 lbs. " " "
" " at the nozzle	188 lbs. " " "
Speed of the Pelton wheel	447 revs. per minute.
Water used per minute	108 cubic feet.
Power of the Pelton wheel	81 H. P.
Total electromotive force of the dynamos	1,170 volts.
Total current	30 amperes.
Total electrical output	47 H. P.
Loss of power transmitted through two miles of line	5·2 H. P.

The cost of the entire installation was:

	£
Dredger	2,600
Race and flume	500
Intake, pipes and valves	600
Electrical plant	2,500
Cartage of material to the site of the works	800
Total	£7,000

The cost of working the machinery with three shifts of eight hours each, as obtained from the results of three years' work, has been:

	Per Week. £	s.	d.
Wages, including dredge-master and electrician	25	0	0
Renewals, maintenance, oils, brushes, etc.	5	0	0
Management, office, rates and taxes	5	0	0
Total cost	£35	0	0

GENERAL ELECTRIC'S FINANCING POLICY.

Northwest General Electric—The Scheme, the Companies Financed, the Facts and Figures from the Official Record

HOW BONDS ARE MANUFACTURED FOR NEW ENGLAND INVESTORS.

CHAPTER IX.

The Mitchell Plant and the Mitchell Electric Company.

It seems almost needless to remark that in working the stock-and-bond scheme in connection with electric lighting stations in small towns the sums involved were, in general, of necessity much smaller than in those cases in which electric railways were exploited. The amount of money involved in the case we are about to discuss is trifling compared with the instances we have already dealt with in the street railway swindles. If, however, the Mitchell operation is somewhat lacking in interest from want of magnitude of the financial part of the scheme, we believe it will be conceded that it justifies giving enough space and time to its consideration to fully exhibit and demonstrate the amount of depravity and dishonesty these exploiters were capable of even in comparatively little things.

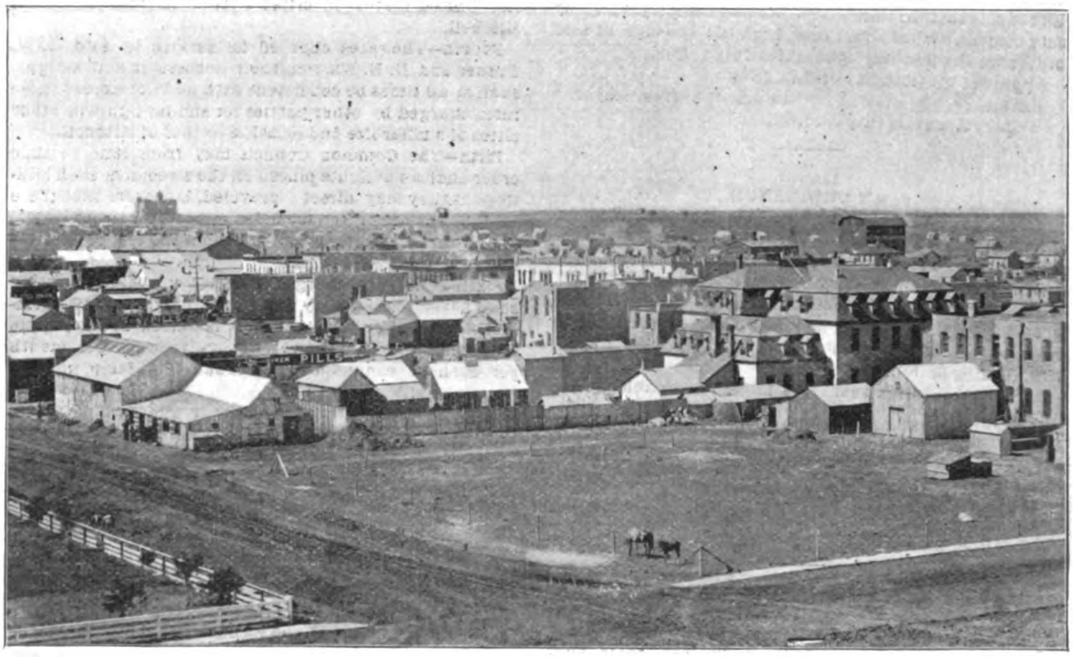
In the introductory chapter to this series of articles, published in last week's issue, we presented a general outline of the plan of conducting what Mr. Coffin has termed "exploiting work" in connection with establishing and operating local electric lighting stations, and we briefly described by what means and in what manner the Thomson-Houston Electric Company "was enabled to expand its business" by the aid of its thrice-christened, thrice-organized and thrice-capitalized sub or sub-parent company in the Northwest. It is now our duty to furnish conclusive evidence of the correctness of the statements made in the introductory chapter; and this we propose to do by citing many specific instances of local electric lighting plants which were established and run under the conditions described, and upon which plants companies were subsequently founded for taking them over and operating them in precisely the manner set forth.

One of the number of properties referred to as being carried as an asset upon the books of the Northwest Electric Construction Company at the time Mr. Byllesby was sent by Mr. Coffin to St. Paul, with instructions to re-christen, re-capitalize, re-organize and conduct the business of the re-organized Northwest sub-company, was known as the "Mitchell plant," and was located in the little town of Mitchell, Davison County, South Dakota.

For the benefit of those of our readers who are unfamiliar with the character of that section of South Dakota, and with its climate, population and resources, and who may not have conveniently at hand the means of obtaining such information, we shall give a few facts bearing on these points.

Davison County, of which Mitchell is the county seat, has a total area of 435 square miles, and its entire population at that time was only 5,449. The density of the population was therefore very low, being only 1.25 per square mile, and it has changed but very slightly since. The soil of the region it includes is quite rich and is very fertile in good seasons, but the frequent, long-continued droughts make the raising of crops and cattle extremely uncertain, and the financial condition of the principal part of the population equally uncertain, and, at times, very precarious. During seasons unfavorable to raising fair crops the inhabitants become, of necessity, relatively quite heavy borrowers. Very bad seasons are not infrequent, and when they occur the demand for money becomes relatively very great, it not being at all unusual, under such circumstances, for money to command interest at the rate of 2[illegible] per cent. per annum, the great risk of making loans on farming property in a country in which the climate is so uncertain justifying this extremely high rate of interest.

The whole State of South Dakota covers an area of 77,650 square miles, and the total population in 1890 was 328 808. The density of the population of the entire State is therefore only 4.28 per square mile. The frequency and severity of the droughts, the intensity of the heat in summer, accompanied with the extreme dryness of the atmosphere, often make the summer climate of this section of the country suggestive of the interior of a baker's oven, and the destructiveness of the intensely dry heat on vegetation can only be fully appreciated by those who have been in the country during a period of long-continued dry weather. The intensity of the heat in summer is more than equalled by the severity of the cold in winter, and the change in temperature in a few weeks is often something very startling, the difference in temperature being frequently as much as 140° F., the changes ranging from 40° below zero in winter to over 100° above in summer. To add to the discomfort and dangers of the inhabitants, the plains are often swept by the most frightful hurricanes and cyclones, which destroy everything in their path.



TOWN OF MITCHELL, S. D. (POP. 2.205.)

The town of Mitchell is located on the line of two railroads—the Chicago, Milwaukee and St. Paul, and the Chicago, St. Paul, Minneapolis and Omaha. At the time the plant was installed it had a population of 2,205. It has one main business street upon which there are a few brick buildings, but most of the structures are of wood. Almost the entire business section of the town is confined within the limits of about 1,400 feet of this street, and very nearly equidistant from the two ends of the street. There are a few side or residence streets, in which are a number of cheap frame buildings, a goodly portion of these being single-story structures. The town has no manufacturing or other industrial enterprises of any kind, except a small steam grist-mill. The town is situated in a prairie district, and its inhabitants are dependent for their trade and support almost entirely upon the agricultural pursuits of the very small population of the surrounding country; and its prosperity and prospective growth rest entirely on the prosperity and growth of the farming interests of the outlying district, and upon the degree of success the farmers meet with in raising their staple crops of corn and wheat, and in cattle raising.

A fair estimate of the very limited capital and business resources of the town and outlying district can be formed from the fact that the combined capital of the three banks in Mitchell is only $125,000, made up as follows:

First National Bank capital	$50,000
Mitchell National Bank capital	0,000
Security Bank capital	25,000

Such was the character, population and condition of what was to be the scene of the operations of some of Mr. Coffin's *exploiters*. We will now devote our attention to the details of how this "exploiting" work was carried on, and to a study of the methods employed in doing it, and to the final results of it so far as it relates to this "Mitchell plant."

At the time we are now dealing with, Mr. E. R. Gilman was the president of the Northwest Electric Construction and Supply Company, and the company had in its employ a Mr. H. W. Turner and a Mr. H. B. Warren. The latter named persons were deputed to make the customary overtures to the town authorities for obtaining a franchise for establishing an electric lighting plant and for securing a contract for furnishing the town with a certain number of lights for lighting the streets. In this they were successful. The nature and terms of this franchise and of the contract can be fully understood from the following transcript of copies of the official documents:

[COPY.]

ELECTRIC LIGHT ORDINANCE.

An ordinance granting to H. W. Turner and H. B. Warren the right to erect and maintain electric works.

Be it ordained by the City Council of Mitchell:

SEC. 1. That there is hereby granted to H. W. Turner and H. B. Warren and their successors and assigns, the right to establish, erect and maintain the necessary buildings, erect poles, posts, lamps, lines, wires, conductors and cables or other appliances or apparatus that may be necessary for the proper generation, conveyance and distribution of electricity for the purpose of illumination, heat and power.

Sec. 2. That for said purposes they may enter upon any of the streets, alleys or public grounds of said city, and make such excavations therein as may be necessary for erecting said posts or poles, or for laying said conductors, wires or cables, provided that such excavations shall be properly protected while open, shall remain open no longer than necessary, and shall be so filled and repaired as to leave the street or alley in as good condition as before the excavation was made. All main lines of wires or conductors shall be erected or laid upon the alleys as far as practicable, and no main line shall be constructed upon any streets except to make connections with some lamp or consumer, or to cross said street, from alley to alley, without a special permit from the City Council, and in no event shall any wire or conductor be allowed to extend over or be attached to the roof of any building.

Sec. 3. That said parties shall begin the construction of said works and lines within two months, and shall have the principal line ready for operation within six months from the passage of this ordinance, unless prevented from doing so by legal proceedings, and in case the provisions of this section are not strictly complied with, all rights of said parties, their successors or assigns, hereunder shall cease.

Sec. 4. That nothing herein shall be construed as exempting said parties, their successors or assigns, from any liability arising from the erection or maintenance of said works or lines, or from negligence of said parties or their employees, or imposing any responsibility upon said city therefor.

Sec. 5. That no exclusive right or privilege is granted hereby to said parties.

Sec. 6. That the privilege herein granted shall continue and be in force for the term of twenty years from the passage of this ordinance.

Sec. 7. This ordinance shall take effect and be in force from and after its publication, which publication shall be without expense to the city.

Sec. 8. If after six years it is found practicable, and is directed by ordinance by the City Council, all lines, wires and cables shall be taken down and laid underground by said company within one year from the passage of said ordinance so directing. [Repealed July 1, 1889.]

Approved this 15th day of May, 1889.

Attest: GEO. A. JOHNSTON, Mayor.

J. F. KIMBALL, City Auditor.

[COPY.]

AN ORDINANCE

To repeal certain portions of an ordinance entitled "Ordinance granting to H. W. Turner and H. B. Warren the right to erect and maintain electric light works."

Be it ordained by the City Council:

That the portion of the ordinance entitled an ordinance granting to H. W. Turner and H. B. Warren the right to erect and maintain electric works, and approved May 15, 1889, reading as follows—

"Sec. 8. If after six years it is found practicable, and is directed by ordinance and the City Council, all lines, wires, cables shall be taken down and laid underground by said company within one year from the passage of said ordinance so directing,"

is hereby repealed.

Approved this 1st day of July, 1889.

Attest: GEO. A. JOHNSTON, Mayor.

J. F. KIMBALL, Auditor.

[COPY.]

AN ORDINANCE

Containing the contract between the city of Mitchell and H. W. Turner and H. B. Warren, their successors and assigns, for the lighting of the streets of said city by electricity, and defining the rights and privileges of said H. W. Turner and H. B. Warren, their successors and assigns, upon the public streets and highways of said city.

Be it ordained by the Common Council of the City of Mitchell:

Sec. 1. That in consideration of the benefits to be derived by the inhabitants of the city by the establishment of a system of electric works, and for the purpose of lighting the streets, alleys, public grounds and buildings of said city by electricity, there is hereby granted to H. W. Turner and H. B. Warren, their successors and assigns, the exclusive right to establish, erect, maintain and operate a system or systems of arc and incandescent lighting, power and heating circuits in the city of Mitchell, for a period of twenty years from and after the passage of this ordinance.

Sec. 2. That for the purpose of erecting the necessary poles, posts, lamps, lines, conductors and cables, they may enter upon any of the streets, alleys or public grounds of said city, and make such excavations therein as may be necessary for the erection of said posts or poles, or for laying said conductors, wires or cables, provided that such excavations shall be properly protected while open, shall remain open no longer than necessary, and shall be so filled and repaired as to leave the street or alley in as good condition as before the excavation was made.

Sec. 3. That nothing herein contained shall be construed as exempting said parties their successors and assigns, from any liability arising from the erection or maintenance of said system, or from negligence of said parties or their employees, or imposing any responsibility upon said city therefor.

Sec. 4. In consideration of the sum of eighty-eight dollars per month, to be paid to said H. W. Turner and H. B. Warren, their successors and assigns, by the city of Mitchell, on the first day of each and every month, for a period of twenty years from and after the date of starting said electric system, the said H. W. Turner and H. B. Warren, their successors and assigns, shall furnish to the said city, upon its public streets, in such locations as the Common Council may direct, eight (8) arc lamps of twelve hundred (1,200) nominal candle-power each, and said lamps shall be kept in operation from the hour of starting the lights of said system until the hour of midnight each and every night in the year; provided, however, that should said lights be out during lighting hours, owing to accidents to the machinery or apparatus of the said H. W. Turner and H. B. Warren, their successors and assigns, then, and in that case, they shall be liable for no damages other than a reduction of the revenue for the period the lights remain so out.

Sec. 5. The rights and privileges granted to the said H. W. Turner and H. B. Warren, their successors and assigns, are granted upon the following condition, a violation of, or a failure to perform, any of which will forfeit all the exclusive privileges contained in this ordinance:

First—The electric system shall be in operation on or before the first day of January, A. D. 18[illegible]0.

Second—That said H. W. Turner and H. B. Warren, their successors and assigns, within two weeks from and after the date of the passage of the ordinance, file with the City Clerk of Mitchell their written acceptance of the ordinance in lieu of one passed May 15, 839, granting them certain privileges.

Third—The said H. W. Turner and H. B. Warren, their successors and assigns, shall at all times during the term of this grant keep their lights in good condition, and furnish at all times as high degree of light as is furnished by the best approved machinery in general use throughout the United States in cities similar in size to that of Mitchell.

Fourth—The rates charged for service by said H. W. Turner and H. B. Warren, their successors and assigns, shall at all times be consistent with and not exceed those rates charged by other parties for similar lights in other cities of similar size and location to that of Mitchell.

Fifth—The Common Council may from time to time order additional lights placed on the streets, in such locations as they may direct; provided, however, that there shall be one arc or ten incandescent lamps, either public or private or both, for every one thousand feet of wire required for such extension.

Sixth—The price charged the city for street lighting shall never exceed forty cents per arc light of 1,200 nominal candle-power per night until 12 o'clock, or sixty cents all night, or one dollar and twenty-five cents per month per each 16 candle-power incandescent lamp until 12 o'clock, or $1.50 all night.

Seventh—That said H. W. Turner and H. B. Warren, their successors and assigns, shall be required to supply the existing demand for electric light at all times.

Sec. 6.—This ordinance shall take effect and be in force from and after its passage and approval by the Mayor and its publication, which publication shall be without expense to the city.

Sec. [illegible]. This ordinance shall have the effect of and be a contract between the city of Mitchell and the said H. W. Turner and H. B. Warren, their successors and assigns, and be the measures of the rights and liabilities of the said H. W. Turner and H. B. Warren, their successors and assigns.

Approved October 8, 1889.

Attest: GEO. A. JOHNSTON, Mayor.

J. F. KIMBALL, Auditor.

Armed with these privileges and the contract, the next step was to make preparations to comply with the conditions imposed, and to make arrangements for erecting and running the plant.

It was decided not to erect a station and not to install an engine and boiler for furnishing power to run the dynamos, but an arrangement was made with the owners of the Monmouth Merchants Mill Company (the steam grist-mill previously referred to) for the rental of sufficient room in which to place the three dynamos which were to be used and for the rental of sufficient power from that company for running them. The three dynamo machines referred to consisted of one 30-light 1,200 candle-power K 12 Thomson-Houston arc dynamo, one 500 sixteen candle power light, old style Thomson-Houston alternating current dynamo, and one D 3 Thomson Houston exciter dynamo, for exciting the field of the alternator.

The plant was erected under these conditions, and poles, circuits and lamps placed in position, and was run at a loss for a number of months. All the apparatus, machinery and supplies used in its construction was charged on the books of the Northwest Electric Construction Company as an asset, and during the existence of that company it owned and operated the plant, making good all losses incurred.

Under the terms of the contract the parties to whom the franchise was granted were bound for a period of 20 years to furnish *eight* arc lights for the sum of $88 per month, which is almost exactly 36 cents per light per night for an all-night arc light. This service was planned to be done with hired power and hired room, and in a town in which the demand for arc lights, both public and private, has never exceeded sixteen, and in which the average price of coal is about $5.50 per ton. All additional lights furnished to the town they were bound to furnish at the rate of 40 cents per light per night up to 12 o'clock, and for 60 cents per light per night for all-night service.

Under these circumstances it was of course impossible to realize any returns from the plant, either by its operation or by its sale, for who wanted to purchase and operate a plant which could not earn enough to pay interest on the investment, to say nothing of providing for its depreciation and continued maintenance?

Trifling as was the actual investment in the three small dynamos, instruments, lines, poles, lamps, etc., comprising the plant, the enterprise was not in such shape as to invite the manifestation of sufficient public spirit on the part of local capitalists, or on the part of the town authorities, to purchase the plant, and thus save to the town whatever benefits, advantages and prestige might be derived from the use of a system of electric illumination.

Some months after starting the plant under the conditions described the owners of the grist-mill notified the Northwest Company that they could no longer continue to furnish room or power for the electric machinery, and it became necessary to make provision to house it elsewhere and to secure steam power from some other source. There was, however, no other source of power in the town, and it was finally decided to purchase a piece of property, erect a building thereon and install an engine and boiler, and to continue the operation of the plant. On the outskirts of the town there was a small plot of land with a very cheaply constructed frame building or shed on it. This land and shed were for sale and were purchased by the Northwest Company for about $350. The wooden shed already on it was remodeled and enlarged to accommodate the proposed plant. In this building was placed one 16′ x 66″ Atlas horizontal tubular boiler with 64 four-inch tubes, the capacity of which was 100 horse power, and the value of it, with fixtures, was about $1,000. The boiler was furnished with an iron smoke-stack, feed pump, etc. The total cost of the steam generating plant, including setting, foundations, piping, heater, feed pump, gauges, etc., should not have exceeded, and ought to be less than $2,100. The engine installed was a second-hand 80 horse power Atlas, and its cost set up, connected to boiler and ready for running should not have exceeded and ought to have been less than $1,500. The building and land cost less than $1,000. Making a total for building, steam generating and power plant, at the highest possible values, $4,600.

The electrical equipment of the station was as follows:

Arc light plant.	Approximate value.	
One 30-light 1,200 c. p. T.-H. dynamo, K 12, with regulator and controller....	$850.00	
20 arc lamps @ $25..........................	500.00	
One buckle switch..........................	10.00	
One lightning arrester....................	7.00	
One arc cut-out..........................	3.00	
		$1,370.00
Incandescent light plant.		
One 500-light T.-H. alternating current dynamo..................................	$1,000.00	
One D 3, 110 volt exciter dynamo........	132.50	
One 34 ampere current indicator........	20.50	
One 64 volt potential indicator..........	30.00	
One S. T. switch..........................	4.50	
One lightning arrester....................	7.00	
One ground detector.......................	15.00	
One rheostat, type 65. D 3, exciter......	20.00	
One station transformer.................	20.00	
Foundations for dynamos, freight and setting..................................	150.00	1,399.50
Belts for transmission of power to dynamos about..............................		130.00
The line equipment consisted of:		
About 6½ miles No.6 wire, worth about	$1,009.00	
" 1¼ " No. 2 wire, "	310.00	
" 110 poles, cross-arms, insulators, set @ $6..................................	660.00	
		1,979.00
Consumers' incandescent light equipment:		
500 lamps and sockets @ 70 cents......	$350.00	
Wiring and connecting @ $1.60..........	800.00	
About 34 transformers @ $2 per light (600 lights)..................................	1,200.00	
About 34 meters at average of $15.......	510.00	
		2,860.00
Consumers' arc light equipment:		
15 hoods and lamps, boards and pole irons..................................	$48.00	
One ceiling board..........................	3.00	
One cut-out box..........................	3.00	
		54.00
Fixtures and tools, about................	$180.00	
Office fixtures, furniture & books, about	75.00	
Extras for small supplies, supervision, engineer, etc..................................	450.00	705.00
Total electric plant......................		$8,497.50
Add:		
Building, steam plant, etc..............		$4,600.00
		$13,097.50

The prices given are in excess of rather than below the actual value.

It needed no trial to convince any competent person that in a town having so few inhabitants, and with so little demand for lights, the property was about as valueless, as an investment, after these changes as it was before. But if trial and absolute proof of this fact were necessary to convince the people who exploited this plant, it came, and we know that the managers of the N. W. Company were notified of the situation by an outsider, through the medium of a document now in our possession, the story of the origin, nature and date of production of which we will now briefly relate.

A little while before Mr. H. M. Byllesby was delegated by Mr. Coffin to take charge of the affairs of the Northwest Company, Mr. J. B. Tarbox, a wealthy stockholder of the Northwest Company and a member of the opulent firm of Tarbox, Schliek & Company, shoe dealers in the city of St. Paul, was induced to take the position of treasurer of that company, and about that time a Mr. Robertson was directed to make a thorough examination of the affairs of that company and its methods of doing business, and to investigate the condition of the local properties owned by it, and to submit the results of his labors in a written report to Mr. Tarbox. This was done and a typewritten report was submitted to Mr. Tarbox in January of 1891, an exact copy of which is in our possession. In this report Mr. Robertson made the following remarks:

"Mitchell Plant. Ordinance issued to H. W Turner and H. B. Warren, their successors and assigns. No record of assignment to this company. Ownership of plant in Northwest Thomson-Houston Electric Company. Hardly pays operating expenses. No prospective increase of business; town losing population, without any possible future. Has been some talk of city purchasing plant, but authorized bonded indebtedness at present beyond limit, and no immediate prospect of sale of plant. Recommend that plant be shut down, which might bring the people to time, and if this will not, advise that the plant be taken out and removed. Investment about $12,000, value about $6,000."

In the paragraph quoted from Mr. Robertson's report there is a most complete confirmation of the substantial correctness of our estimate of the first cost of the plant. The investment he names is, however, quite a little below our estimate, but he *knew* what had actually been expended in *installing* the plant up to that date, and further knew that, owing to a quite serious injury to the boiler, and the unsuitable character of the engine, and depreciation of the property from various causes, the actual value was much below the original cost; and with all these facts before him, he estimates the value of the plant in January, 1891, at $6,000, or considerably less than half of our estimate of its original cost. His report also fully confirms our views as to the worthless character of the plant as an investment.

With Mr. Robertson's report actually on file in the office of the Northwest Company, and easily accessible to, if not actually read by Mr. Byllesby, it might be fairly expected that in this case at least some doubt might have arisen concerning the wisdom of attempting to found a company on such a worthless property as this Mitchell plant had actually proven itself to be, and it might be hoped that no one could be so destitute of honor, so completely devoid of conscience, so thoroughly unscrupulous as to endeavor to capitalize it for $35,000,—$15,000 in stock and $20,000 in bonds—and to finally decide to issue $15,000 of stock and $15,000 of bonds on it.

(*To be continued.*)

Straightening out the Central Station Load Line.

There is nothing which concerns central station men more intimately than the question of levelling out their load line, and suggestions in this line are always read with interest. Practical results expressed in definite figures are still more sought after and harder to find, and whenever we come across them we are glad to give them space. In the issue of *Lightning* for July 23, Mr. C. H. Wordingham, chief engineer of the Manchester Corporation Electricity Works, contributes a letter on this subject which is as follows:

To the Editor of LIGHTNING.

DEAR SIR: We have here two alternative rates, either an ordinary rate of 6d. per unit as measured by meter, or a fixed charge rate. It is this fixed charge rate which provides a sliding scale. In this latter rate we make a charge of £12 per annum for every 1,000 watts in the maximum demand, and in addition to this 2d. per unit as measured by meter. If you work out several cases you will find that this gives a diminished rate per unit as the number of the hours of burning is increased. I enclose two tables which show this very clearly.

Table A shows the average cost to a consumer for different hours of burning during the year. Take the case of a consumer using current about 1,200 hours a year, or rather over three hours per day, the fixed charge is £12, the meter charge £10, a total of £22; the average cost is 4.4d. Take now the case of an underground restaurant where current is consumed for ten hours per day, or 3,500 per annum, the fixed charge remains the same, but meter charge is increased to £29 3s. 4d., and the average cost works out to 2.8d. per unit. Taking the extreme case, which would never, or very rarely, arise, of a consumption extending for twenty-four hours per day throughout the whole year, or 8,760 hours per year, the fixed charge is £12 as before, and the meter charge is £73, giving an average of 2.33d. per unit, which is the lowest price possible with our present fixed charge. It will thus be apparent that our charge for current varies from 6d. per unit down to 2⅓d. per unit, and that it does so absolutely continuously; that is to say, there are no breaks, nor is it possible for a consumer to diminish his account by burning a few more units, as is the case with many systems of discounts.

In the second table, which is practically only a variation of the first, there is shown a number of hours during which the current must be consumed in order to attain a certain average price per unit. Thus, if a consumer would get current at 5d. per unit his hours of consumption must reach 960 per annum, and if he would get it at 3d. his hours must be 2,880.

I do not suppose that this matter would be of sufficient interest to your readers to warrant any lengthy description, but if it would, I should be happy to furnish you with an article on the subject. Yours truly,

C. H. Wordingham, Chief Engineer.

Table A.

Showing the number of hours' burning during which a consumer must consume current in order to obtain it at different average rates.

Price per unit in pence.	No. of hours of burning per year.	Price per unit in pence.	No. of hours of burning per year.
8	480	5	960
7½	523	4½	1,160
7	576	4	1,440
6½	640	3½	1,920
6	720	3	2,880
5½	823	2½	5,760

Table B.

Showing the average cost per unit with the fixed method of charge, the charge being £3 per quarter per unit of maximum demand, and the meter charge being 2d. per unit consumed.

Hours of burning per year	Average price per unit in pence.	Hours of burning per year.	Average price per unit in pence.
100	30.8	2,500	3.15
200	16.4	3,000	2.96
300	11.6	3,500	2.82
400	9.2	4,000	2.72
500	7.8	4,500	2.64
600	6.8	5,000	2.58
700	6.1	5,500	2.52
800	5.6	6,000	2.48
900	5.2	6,500	2.44
1,000	4.9	7,000	2.41
1,200	4.4	7,500	2.38
1,400	4.1	8,000	2.36
1,600	3.8	8,500	2.33
1,800	3.6	8,760	2.33
2,000	3.4		

Note.—One unit of maximum demand signifies that when all lamps are alight one unit is consumed per hour. One unit will maintain fifteen lamps of about 16 c. p. alight for one hour.

London Notes.

(From our Special London Correspondent.)

For some months past there has been in progress a system of electric tramways which is to run between two West of England towns, Kingswood and Bristol. The overhead wire system is to be used.

A central station was opened at Salford, near Manchester, the other day, the cost being just under £35,000. The high pressure alternating current system has been adopted.

The Cost of Niagara Power.

In *Cassier's Magazine* Mr. F. L. Stetson discusses the cost of power from the utilization of Niagara, and arrives at the extraordinary conclusion that in Buffalo, where coal is only $1.50 per ton, it would be cheaper for the good people of that city to employ the electrically transmitted power from the Falls than to use coal even if it were furnished free at the furnace door. If his general deductions are made on such a basis as that which follows, we tremble for those who have invested money in the Niagara scheme: "When in England in 1890, I was told by an eminent gentleman that it was useless to discuss the profitable employment of water-power, for, as he said, 'You can produce steam-power from coal at a cost of a farthing an hour' (1 h. p. hour we presume—Eds. *Electrical Review*), to which I answered: 'Very well, let us work on the problem. Coal, at a farthing an hour, would, in America, represent 5 cents for a day of ten hours, or 12 cents for a day of twenty-four hours, which is, for 300 days in the year, $15 for the short day, and $36 for the long day for fuel only. At Niagara we will gladly furnish continuous 24-hour water-power for $15 a year, in any considerable quantity.'" Of what avail is it to be able to furnish 1 horse-power per year for $15 at Niagara, if to get the same amount in Buffalo it is necessary to pay for more than double that power to make up for losses in transmission. More persuasive arguments than these are necessary, Mr. Stetson, to convince engineers of the economy of electrically transmitted power (even if the source is water) over coal at $1.50 per ton at the furnace door; and so far as the public is concerned, such writing is altogether misleading.—*Electrical Review* (London).

THE CHOICE OF TRANSFORMERS.*

BY D. C. JACKSON.

The public data which are available for forming an opinion of the comparative economy of transformers are very meager. The little which is obtainable is to be found in a great measure in the advertising circulars of manufacturers, and while these results, being tests of their own and of rival makes, are often entirely reliable, such *ex parte* data are unsatisfactory to a careful purchaser. In order to place before you independent data representing all the American transformers of moderate capacities, I will give the results of a long and carefully carried out series of tests made by A. H. Ford in the laboratory of the University of Wisconsin. For these tests transformers of 1,500 watts capacity, as nearly as possible, were procured directly from the manufacturers within about a year from this date, so that the tests may be presumed to represent the latest and best designs which are now supplied. These transformers are from the most prominent makers and in fact include all important makes of American transformers with two or three exceptions.

The results of the tests are given in the attached table :

Number.	Watts capacity.	Open circuit current.		Watts (iron) loss.		Watts (copper) loss at full load.	Total pressure drop.	Efficiencies at full load.		All day efficiency.	
		F = 125	F = 60	F = 125	F = 60			F = 125	F = 60	F = 125	F = 60
1	1250	.043	.066	37	48	30	2.5	95	94	85	83
2	1500	.076	.124	50	71	45	3.5	95	94	85	81
3	1500	.052	.1.0	34	46	38	4.0	96	95	89	85
4	2500	.230	.540	135	230	44	2.5	92	89	77	65
5	1800	.076	.600	53	109	67	5.0	94	92	85	75
6	2000	.055	.091	42	56	55	5.0	95	94	89	86
7	1000	.028	.064	24	28	33	3.0	95	94	87	86
8	1500	.073	.11[illegible]	37	76	31	2.5	94	93	83	79
9	1500	.077	.144	43	55	28	3.0	95	95	86	84

These results, I find, do not differ very widely from those published by the Fort Wayne Electric Corporation in a small blue-printed pamphlet which, however, contains tests made by the company upon only a few of the makes of transformers included in my table.

The data for each transformer are given for tests upon two frequencies, 125 and 60 periods per second respectively. Efficiencies have been calculated and are given in the table for each transformer when operated upon each frequency continuously at full load and also when operated at an assumed load which may be taken as an approximation to the average load found on good stations operating 24 hours. The latter are called "all day" efficiencies and are calculated as though the transformers ran 19 hours out of the 24 on no load and 5 hours on full load.

A comparison of the losses of the different transformers and their efficiencies shows in most cases that the transformers with the smallest iron losses give the highest "all day" efficiencies. The effect of the iron loss on the working efficiency depends upon the length of time the plant runs. The waste of power due to the iron loss in the transformer continues as long as current is fed to the primary circuit, consequently a plant which only runs 6 hours per day will only waste one-quarter of the power by the iron loss of its transformer that it would if operated 24 hours per day. The actual number of watt hours used by the customers of the plant might not differ very greatly in the two cases, yet the output of the station when run 24 hours might be much greater than when run 6, the difference being due to the difference in the amount of power wasted in the transformers. It is therefore evident that extreme care in the selection of the best transformers to be used on an alternating plant which runs all day may be of the greatest advantage. The lower the frequency of the alternating current which is used the greater are the returns coming from this care likely to be.

Let us compare transformers Nos. 3 and 4 as given in the table. These are both made by well known manufacturers. The copper losses at full load do not differ very much, what difference there is being in favor of No. 4; at average loads there being considerably less difference in these two points.

The iron losses, which go on regardless of the load as long as current flows in the primary winding, differ very greatly even if we take three-fifths of the losses in No. 4 as the losses of a 1,500 watt transformer of that type. Let us suppose that these transformers are placed on a plant which supplies current 24 hours each week day and 12 hours on Sunday, which makes a total of 8,136 hours per year that current would flow in the primary winding of the transformers, and the total number of watt hours wasted by the two transformers is shown below.

F = 125

Transformer No. 3.........8,136 × 32 = 260,300
Transformer No. 4.........8,136 × 80 = 651,000

F = 60

Transformer No. 3.........8,136 × 46 = 374.800
Transformer No. 4.........8,136 × 140 = 1,140,000

In a station which turns out a kilowatt hour for each eight pounds of coal burned (and this in Wisconsin requires the station to be well arranged and the use of coal that costs $2.50 or more) transformer No. 4 requires the buying of about a ton and a half of extra coal every year when operated at a frequency of 125; therefore it costs, other things being equal, upwards of $4 per year more to operate than No. 3. It would therefore pay well, if other things were equal to buy transformer No. 3, even if its first cost were many dollars greater than that of No. 4. The difference between the transformers is even greater when the frequency is 60.

For every hundred transformers of the types here compared, the generator plant that supplies current to No. 4 must be of five kilowatts greater capacity than that required for No. 3, which means an increase of 3 per cent. in the generating plant; that is, a plant of a given size which uses transformer No. 4 must have a capacity for supplying current greater by 3 per cent. than if transformer No. 3 were used.

The difference between these two transformers is largely due to differences in the relative amounts and arrangements of the iron and copper in the cores and windings, and the magnetic quality of the iron core. The standing of the manufacturers renders it probable that the transformers are of equal durability and reliability, but the regulation of No. 4 is better. The regulation question, which should be carefully considered, makes a serious deduction from the claims of No. 3 to first place in the comparison.

Differences sometimes occur between transformers of the same size and same make which are not as great as the differences here shown to exist between Nos. 3 and 4, but are sufficiently great to seriously affect their economy. In order to husband the capacity of a plant and to save in operating expenses, it is therefore of importance not only to test transformers of different makes which are presented for sale, but to test each transformer which is put on the line. This may be easily and expeditiously done. To test the iron losses the secondary coil of a transformer should be connected to the regular lighting circuits, with an ordinary wattmeter included, and the circuit of the primary coil should be left open. The reading of the wattmeter shows the number of watts which are wasted by the iron loss.

A wattmeter such as is required for these measurements costs from $40 to $70, and is an instrument that, like the steam engine indicator, pays to have at hand for proper use. However, if the regular wattmeter is too expensive to buy, an ordinary Thomson recording wattmeter, provided a sufficiently sensitive and reliable one is at hand, may be used in place of it, and the record reduced to the basis of one hour. It is needless to say that instruments which are used in such tests as are here proposed must be fairly reliable.

To test the copper losses in a transformer the quickest and easist method, which is approximately accurate, is to connect the primary coil of the transformer in series with some resistance (iron wire or lamp) to the alternating incandescent circuit, and short-circuit the secondary coil of the transformer through an amperemeter. The resistance should be adjusted until the full load current of the transformer flows through the amperemeter. The reading of a wattmeter so connected in circuit with the primary coil gives the copper loss approximately.

The drop in pressure in a transformer may be measured by connecting the transformer to the lighting circuits and reading the primary and secondary pressures by voltmeter. The transformer may then be loaded by lamps and the pressures again read, when the drop is at once seen. One voltmeter may be used for this, but two are more convenient.

For the testing of individual transformers as they are delivered and before they are put on the lines, all the instruments which are required are already in the possession of the electric station, with the exception of a wattmeter, and this is not a serious deficiency since, if necessary, a Thomson recording wattmeter may be used instead. The testing need take but little time and is likely to result, in average stations, in the saving of considerable wastes.

Proper records of his transformer tests enable a station manager to determine at once the amount of saving that he may make by replacing certain small transformers by one large transformer. If tests are not made, such changes may not bring the results expected, since a number of first-rate small transformers may be replaced to no advantage by a large transformer if the latter is not a good one, but usually a large transformer, if one of the best, is more desirable than several small ones, whether they are good or bad.

For your guidance in selecting transformers, I will give you the following data, contained in a table made out by Prof. Ryan. The table gives the largest currents which should flow in the 1,000 volt primary of good transformers when the secondary circuits are open :

Watts capacity.	Leakage current.
1,000	.055
2,000	.080
6,500	.100
17,500	.200

When the low pressure coil is connected to a 100 volt circuit the leakage currents may be expected to be ten times as great.

For intermediate capacities, intermediate values of the open circuit or leakage current may be expected. I shall add to this the values of the iron loss, which should not be exceeded in thoroughly good transformers.

Watts capacity.	Iron loss.
1,000	30
1,500	40
2,000	50
2,500	60
4,000	80
6,500	100
17,500	150

The copper losses in transformers of all sizes should never exceed 3½ per cent. at full load, and ought to be between 1½ and 2½ per cent. The total drop in secondary pressure, due to loading a transformer, if the primary pressure is kept constant, ought not to exceed 3½ per cent.

---

* Read before the Northwestern Electrical Association, Chicago, July 19, 1895.

BOOK REVIEWS.

Electrical Engineers and Students' Chart and Handbook of the Brush Arc Light System. By H. C. Reagan, Jr. 8vo, cloth, 48 pp. New York; Norman W. Henley & Co Price $1.00.

The object of this little book is to give to those connected with the Brush system of dynamos a clear and simple explanation, together with illustrations of the different parts of the dynamo, and to afford for students a non-technical description of this well-known machine. A unique feature of the book is a chart by which the Brush commutator is explained. This consists of a heavy card upon which has been engraved the fields with their various connections, and rotating in front of this is a transparent mica disk upon which have been drawn the armature ring and coils together with their connections with the commutator segments. Four mica brushes are also represented, so that as the disk is revolved the courses of the currents are readily traced out for any position of the armature and commutator. By means of ordinary diagrams this tracing of the currents has always been the most difficult part of the machine to explain, but by the means resorted to here it becomes exceedingly simple.

The other illustrations are of the usual kind, embracing both diagrammatic and perspective views of the various parts of the machine, including the Brush regulator, or dial, and are drawn to a sufficient scale to be easily followed.

The method of changing a machine from right hand to left hand is fully explained. Troubles and remedies are given due attention, and a table of dimensions of the various arc-light dynamos is added.

We think the book will be of great interest to all of those having this make of machine in their charge.

American Institute of Electrical Engineers —Applicant's Manual.

Mr. Ralph W. Pope, secretary American Institute of Electrical Engineers, 1,009 Havemeyer Building, New York, has just issued a little pamphlet entitled "Applicant's Manual," prepared to meet the demand for information regarding the work of the Institute and how to join it.

This is a very handy little brochure which should be productive of much good in extending the usefulness of the Institute by spreading more widely the information as to how membership may be acquired. The table of contents includes the following:

1. Instructions for Joining.
2. Fac-simile of Application Blank.
3. Form of Application for Transfer.
4. Rules of the Institute.
5. List of Members (geographical).
6. Classified List of Papers Published.
7. Definition of Electrical Units.

Copies will be supplied *gratis* by the secretary to all who apply to him for the same.

Personal.

Mr. A. S. Terry, of the Sunbeam Lamp Manufacturing Company, has returned to Chicago after a two weeks' vacation in the East.

Col. S. G. Booker, after a long absence, was a welcome visitor in New York and Boston last week.

Mr. L. B. Sherman, for many years connected with the *Railway Review* of Chicago, has been appointed Western manager for "The Official Railway Equipment Guide" and "The Pocket List of Railroad Officials."

According to a London writer the Brussels Electric Railway is an excellent example of international practice. The boilers are English, the engines German, the motors American, the chief engineer Italian and the clerks in the general office French.

General News.

What is Going on in the Electrical World.

Smithville, Tex.—A company is being organized here to put in waterworks and electric lights.

Elizabethtown, Ky.—An effort is being made here to organize a local electric light company.

Cynthiana, Ky—The Cynthiana Electric Light Company has been organized with a capital of $10,000.

Windom, Minn.—The city council has awarded the electric light contract to the Western Electric Company.

Topeka, Kan.—The city council are considering the purchase of new machinery for the city electric light plant.

San Diego, Cal.—George B. Kerper, purchaser of the cable road, will proceed at once to change the road to an electric system.

Dallas, Tex.—E. L. Wood, C. B. Gillespie and others are forming a company to build an electric line to Oak Lawn in the suburbs.

Greenport, L. I.—The stockholders of the Greenport Electric Light and Power Company have voted to sell the entire electric plant.

Allentown, Pa.—Work on the Allentown and Reading trolley road will begin as soon as the awards to the bidding contractors are decided.

Hawkinsville, Ga.—By a unanimous vote the citizens of Hawkinsville have decided in favor of a waterworks system and electric light plant.

Buffalo, N. Y.—The Proctor-Raymond Electric Company of Rochester, manufacturers of electric bells, annunciators, etc., will establish a plant in Buffalo.

McLane, Pa.—Hon. Emmet Wilcox visited this town lately for the purpose of securing right of way for a new electric road to run from Cambridge to Erie.

Saratoga, N. Y.—Proposals will be received until October 12 by James D. McNulty, clerk, for the furnishing of street lights, etc, for one or four years.

Cairo, N. Y.—The Cairo and Windham turnpike has been purchased by a number of capitalists who propose to build an electric railroad from Cairo to Prattsville.

Beeville, Tex—Messrs. Lowery and Wolf, of Temple, Tex., have made a proposition to the citizens of the town to put in an electric light plant and a telephone system.

Flushing, Mich—The contract for the dynamos and electrical equipment of the new electric light plant has been awarded to the Fort Wayne Electric Corporation.

Lockport, N. Y.—After many months of exasperating disappointments and broken promises, this city has an electric street car line that every one is satisfied with.

Petersburg, Va.—The right to build an electric railway between Petersburg and Manchester has been awarded to the company represented by John Robertson of Manchester.

Los Angeles, Cal.—The board of public works recommend that the council grant the franchise for an electric railway in Eighth street to the Los Angeles Traction Company.

New Orleans, La.—An application for a franchise by J. P. Loomis to erect and maintain an electric light plant in the city was referred to the council committee on franchises.

Phœnix, Ariz.—The Phœnix Light and Fuel Company has purchased the Gardiner electric light plant and will combine both plants at the power-house of the Phœnix Company.

Philadelphia, Pa.—The officials of the Southern Passenger Railway have determined to use an electric storage battery system to operate their cars as soon as the road is finished.

Richmond, Va.—The city council has concurred with the board of aldermen in giving to the Richmond Traction Company the right to establish a new street car line on Broad street.

Nevada, Mo.—The electric light and power franchise lately granted to Col. Geo. V. Dudley of St. Louis has been confirmed by a majority vote of 20 to 1 at the special election. The franchise runs for ten years.

St. Paul, Minn.—The business streets of St. Paul are to be electrically lighted if the assembly concurs with the board of aldermen in deciding to abolish the gas lamps and put in 2,000 c.p. arc lights at the street corners.

Hoboken, N. J.—The Hoboken Railroad, Warehouse and Steamship Company, of which Col. E. A. Stevens is president, has applied for a franchise for an electric freight railroad along the water front in Hoboken.

Little Falls, N. Y.—The trustees of Richfield Springs have decided to leave to a vote of the taxpayers the question of permitting the proposed Little Falls and Richfield Springs electric railroad to enter that nobby village.

Rockville, Md.—The Tennallytown and Rockville Electric Railroad Company's franchises, railroad tracks, cars and other equipment, and also the real estate of the company, are to be sold at Bethesda post office on the 25th inst.

Staten Island, N. Y.—The Edgewater trustees have passed a resolution that the Interior Electric Railroad Company must sign its contract with the village, file its bond and deposit $10,000 by September 10 or its franchise will be revoked

Mt. Morris, N. Y.—An electric light and power plant will be put in at Craig Colony for lighting the grounds. Power is obtained from a stream which runs through the Colony property, and an auxiliary steam plant will be put in, all costing about $20,000.

Topeka, Kan.—The city council has under consideration the purchase of new machinery for the city electric light plant. An electric company, it is said, has made the city a proposition to take the old machinery and put in complete new works for $10,000.

Georgetown, Mass.—At a special town meeting held here a few days ago to take action on the petition of the Haverhill, Georgetown and Danvers Electric Railroad Company for a location through this place, it was resolved to welcome the proposed road into town.

New York.—A scheme is in contemplation whereby the Eighth avenue line of horse cars may be superseded by an underground trolley system, to extend from Canal street to the Harlem river. The system in view is similar to but an improvement on that in use at Budapest.

Santa Cruz, Cal.—F. W. Swant n has made terms with Henry Cowell for the purchase of Cowell's water rights in the San Lorenzo River for the purpose of obtaining power with which to operate factories and electric light plants. A company is to be formed for the purpose of utilizing the power.

Keene, N. H.—A charter for an electric street railroad in Keene, N. H., was procured three years ago, and the subject of building is now being agitated. President Elisha Lane, Francis C. Faulkner and C. J. Woodward have been appointed a committee to receive propositions for construction.

Omaha, Neb.—A special election is to be held at Florence on the 17th inst. to get a vote on the proposition to issue $18,000 in bonds to aid the company that proposes to build an electric street railway between Omaha and Florence. V. G. L ntry, Walter G. Clark and Fred Parker are the leading men in the company.

Osborn, O.—Sealed proposals will be received to September 16 for furnishing all labor and material required for the construction of an electric light system and a water works system, according to plans, etc, on file Wm. G. Moler, consulting engineer, Bushnell Building, Springfield, O., can give information

Sea Cliff, L. I.—At a recent meeting of the board of trustees a resolution was adopted to place before the voters a proposition to light the village by electricity, the amount to be expended not to exceed $8.500. The clerk was also ordered to issue notices of the village election, which will take place September 10.

Bowling Green, O.- J. R. McKnight, president of the Bowling Green Electric Lighting Company, has been granted a franchise to build and operate an electric road in this city, and has secured the right of way from Bowling Green to Perrysburg where the road will connect with the Toledo and Maumee Valley belt line.

Detroit, Mich.—It is expected that work will begin very soon on the Detroit, Port Huron and

St. Clair River Railroad. The route of the road is from Detroit to Mt. Clemens, to Chesterfield, to New Baltimore, around Anchor Bay and up the lake and river to Port Huron. Freight as well as passengers will be carried.

Baltimore, Md.—An electric suburban railway is proposed, to extend from Powhatan to Harrisonville, connecting with the Gwynn Oak branch of the Baltimore Traction Company's system at Powhatan. It is understood that the Baltimore Traction Company will construct and equip the road provided the projectors subscribe $15,000 or $18,000.

Jersey City, N. J.--The street and water board has resolved to reorganize the street-lighting system of this city. The city for this purpose has been divided into districts. Some of these—the greater portion—are to be lighted by electricity, while in others gas or oil may be used, as the bids for same may dictate. The board will ask for a series of bids.

Sea Isle City, N. J.—John L. Burk, Wilson Banks, Mayor Frank Smith of Holly Beach, and Councilman George Ent of Anglesea expect to secure a franchise from the borough councils of Holly Beach and Anglesea to build an electric trolley road on Five Mile Beach, connecting Anglesea, Wildwood and Holly Beach. All of the towns will also be lighted by electricity.

Fort Wayne, Ind.—The Fort Wayne, Lake Everett and Columbia City Street Railway Company has completed its organization and the following officers were elected: President, C. E. Everett; vice-president, William Geake; secretary, W. E. Doud. The capital is $800,000 and C. E. Everett and W. E. Doud, of Fort Wayne, own all but three shares of the stock.

St. Helena, Cal.—The town trustees have granted L. Crothwell a franchise to build an electric road along the main streets of St. Helena; also to construct and operate an electric light plant. Mr. Crothwell already has franchises from the county supervisors and the Napa City trustees and proposes soon to begin work on the electric road from Napa to Calistoga.

Peoria, Ill.—The Fort Clark Electric Railroad of this city has passed into the hands of Columbus R. Cummings and Walter Barker, leading stockholders of the Central Railway, and the two systems, the only ones in Peoria, have been consolidated, with the general manager of the Central in charge of both. Both roads recently obtained new franchises from the city council.

Chicopee, Mass.—The commissioners appointed by the Supreme Court to set a value upon the plant of the Chicopee Electric Light Company report that the plant is worth $27,000. The date of transfer to the city was set for October 1. The board consisted of ex-Governor W. E. Russell of Cambridge, James Renfrew of Adams and Theodore C. Bates of North Brookfield.

Rome, N. Y.—Bids for the material and labor required in the erection of a boiler house and dynamo room, building conduits, electric wiring, etc., for the Rome State Custodial Asylum, will be received up to 12 o'clock, Sept. 11. Proposals must be for the whole work and addressed to E. Stuart Williams, president of the board of managers of the Rome State Custodial Asylum, Rome, N. Y.

La Porte City, Ia.—This town was "thrown wide open" when the vote on waterworks and electric lights was announced at the recent election; the majority in favor was overwhelming. The electric light and water plant will cost about $25,000 and will be installed by a local company comprising W. D. Wagoner, president; E. Duke Noven, vice-president, and H. Van Valkenburg, secretary and treasurer.

Syracuse, N. Y.--The Syracuse Street Railway Company has purchased the Consolidated lines from the bondholders, whose representative bid in the property recently for $865,000. The Street Railway Company at that time, it will be remembered, bid $864,000. What they paid in the later transaction has not been made public; the purchase, however, puts them in possession of the whole street railway system of the city.

Logan, Utah.—The Hercules Electric Power Company, at the head of which is Hon. L. L. Nunn, of Colorado, proposes to erect an electric plant on Logan River, a few miles from this town. At that point almost any power may be obtained from the stream. For the purpose of providing light, the company has decided to begin with 1,000 H. P., which may be increased as occasion requires. An electric railway is included in the scheme.

South Framingham, Mass.—The Milford, Holliston and Framingham Electric Railway Company has applied for a franchise to the towns through which it will operate its new road. The South Middlesex Company will furnish power for the new road to operate to Holliston, the Hopedale Electric Company to operate from Holliston to Milford. The Worcester Construction Company will build the line and the company expects to open up before January, 1896.

Washington, D. C.—The Eckington and Soldiers' Home Railway Company are likely to abandon horses in the operation of their line and adopt some other motive power.—The Washington and Great Falls Electric Railway Company has filed a deed of trust conveying its railway property, franchises, etc., to the National Safe Deposit Company to secure 1,300 coupon bonds aggregating $500,000. The purpose of the issue is to provide for the completion and equipment of the road.

Trenton, Ont.—The contract for lighting the town for ten years has been awarded to the Brush Electric Company of Cleveland, O., represented here by Col. W. S. Rogers. The magnificent waterpower, capable of producing 12,000 H. P., north of the town, on which a suitable power house was constructed last year, will be used for the purpose. Besides an incandescent system of lighting, the company will develop the power by putting in large generators, and distribute current through the town for manufacturing purposes.

Hamilton, O.—The city electric light and power plant is to be "dedicated" on the 19th inst. with a splendor calculated to make the event memorable. The programme is an elaborate one, and the celebration will probably last far into the night. "At 6:30 P. M. there will be a festive salute of fifty guns, followed by a grand band concert, dress parade, choral music and a specially arranged display of electrical pyrotechnics. Electrical fountains, similar to those in use at the Columbian Exposition will delight the eye, and the city at large will be lavishly decorated." Arrangements have been made for low rates over all the railroads leading into the city, and a large influx of strangers is expected.

Pittsburg, Pa.—The local papers announce the arrival in this city of R. B. Elwell of Sydney, New South Wales. Mr. Elwell is an electrical engineer in the employ of the New South Wales Government, and came here to study the electrical systems of this country. He is a member of the Society of Civil Engineers of London. He said that the Government in Australia had built and owned almost all the railroads with the exception of a few short lines. There are 2,500 miles of railroad in New South Wales. The freight is handled by Baldwin locomotives, but the passenger traffic is hauled by engines of English make. The Government is about to adopt electricity on the railway lines both for motive, automatic signaling and switching purposes. Mr. Elwell visited the Westinghouse plant at East Pittsburg and pronounced it far ahead of any shops of the same character in the world.--A scheme of electric railway extension involving about 200 miles of road is reported to be under consideration by the Second Avenue Traction Company and others. The road is to be extended along the Ohio River from Pittsburg to Wheeling, touching East Liverpool and Steubenville, and from Wheeling will pass through Washington to Brownsville, thence following the Monongahela to the present terminus near McKeesport, making a complete circuit.—Eugene Ingold has been appointed chief inspector of the new division of inspection in the city bureau of electricity.

Some Big Okonite Cables.

The Okonite Company is making two immense cables for the Metropolitan Telephone Company, to carry wires under the Hudson River. Each of the cables has twenty-four conductors and is over a mile long. The company recently manufactured two similar cables to connect New York with Brooklyn. Another piece of work just finished was a cable three miles long and covered with lead armor made all in one piece. It was shipped to Lenox, Mass., where it will be laid in a subway.

Standard Underground Cables at Buffalo.

The Police Commissioners of Buffalo have contracted with the Standard Underground Cable Company for 14,295 feet of cable to complete the police telegraph system.

International Electric Company.

It would seem that the incandescent lamp trade is improving, for there comes an announcement of the location of another factory in St. Louis. The style of the new company as incorporated under the laws of the State of Missouri is the International Electric Company. The location of their factory is 19th and Olive streets, St. Louis, being within three blocks of that city's new Union Station. Their factory building is modern in every respect, being five stories high and especially adapted to the work to which it is to be put. The manufacture of the incandescent lamps is in the hands of J. M. Davey, who, for some ten years has been identified with the incandescent lamp business. The business management of the company is in the hands of H. G. Ferguson, who has been actively identified with several large central stations in the West, and who is thoroughly familiar with electrical matters both theoretical and practical.

The object of the new company is to furnish a strictly high grade lamp that will appeal for approval alike with the central station, isolated plant and the trade in general. The new lamp, to be put on the market shortly, will be known as the "Davey High Grade."

Beacon Lamps at the Boston Conclave.

The Beacon Lamp Company of Boston met with flattering success with their 11,000 lamps used in the Knight Templar decorations. Mr. J. R. Masury, electrician of B. F. Keith's New Theater, reported that he used three makes of lamps in his Knight Templar decorations, that two-thirds of them were of the Beacon make, and in their four-hour test they lost but one Beacon lamp, and 40 and 200 of the other makes respectively. The conditions under which they were used were very trying, owing to intense heat due to close grouping of the lamps. The Beacon Lamp Company are justly proud of this result.

Catching Up With Orders.

After a continuous run, excluding Sundays, of a thousand hours, the Crocker-Wheeler Electric Company have almost caught up with their orders, which since the fire of last April have been nearly twice as large as ever before. The company have also nearly replaced their stock of parts and are therefore able to serve their customers with greater promptness than has recently been possible.

BUSINESS HINTS.

Public Buildings, Theaters, Residences, &c., Proposed or in Course of Construction.

[The following summary is prepared weekly for ELECTRICITY for the information of advertisers and readers who are dealers in apparatus and articles required in the electrical equipment of public and private buildings.]

Albany, N. Y.—It is reported that a hotel and theater building is about to be erected in Albany at a cost of nearly $1,000,000.

Ambler, Pa.—Dr. Mattison will erect a $75,000 house on the Reiff property.

Amesbury, Mass.—The directors and board of auxiliary of the Y. M. C. A. have voted to build a banquet hall at the new gymnasium, with all modern conveniences.

Beloit, Kan.—Sealed proposals will be received at the office of the State Industrial School for Girls, or by the Board of Public Works of the State of Kansas, until Sept. 19, for the completion of a system of electric lighting. Copies of plans will be on file at office of the Board of Public Works, Sol. Miller secretary, Topeka, Kan.

Boston, Mass.—A five story office and store building will be erected at 729-731 Boylston st., for John C. Haynes.... A. D. Puffer will erect a five story mercantile building at 104 Cambridge st.

Brockton, Mass.—At a meeting of the Palace Hall Corporation, it was decided to erect a $30,000 building at once.

Brooklyn, N. Y.—Senator Wm. H. Reynolds is having plans made by Architect J. B. McElfatrick & Sons, 1402 Broadway, New York City, for a $50,000 residence for himself on Vanderbilt ave., near the Eastern Parkway, which will be heated by steam and lighted by electricity.... James Lamb will build 2 four story double apartment houses, north side of Park Place, east of Classon ave.... Louisa Squire will build 2 four story double apartment houses, south side of 8th st., west of 4th ave.

Buffalo, N. Y.—Henry W. Sprague will erect a handsome building on Oakland Place from plans prepared by Architects Babcock & Willard, of New York.

Chicago, Ill.—Architect Charles H. McAfee, 34-36 La Salle st., has prepared plans for a seven story and basement manufacturing building, to be erected on West Van Buren st., near Halstead; heated by steam, lighted by electricity; one passenger and two freight elevators.

Cleveland, O.—H. C. Ford is interested in the erection of a fourteen story building, to be erected cor. Euclid ave. and the Public Square, to cost upwards of a half million dollars

Dobbs Ferry, N. Y.—A syndicate of New York capitalists have purchased the old Manhattan College grounds at Dobbs Ferry, and will erect a hotel and casino building. Colt, Trowbridge & Livingston, 287 4th ave., New

York City, will design the structure and superintend its construction.

Galveston. Tex.—A building, complete in all details, is to be erected here for the Y. M. C. A.

Kansas City, Mo.—The proposed public library building will be lighted by gas and electric lights.

Memphis, Tenn.—Chickasaw Lodge, I. O. O. F. has passed a resolution to erect a seven story lodge and office building at a cost of $100,000.

Milwaukee, Wis.—The plans of Ferry & Clas for the proposed masonic temple have been accepted; they call for a six story building, to cost $60,000.

Morristown, N. J.—The Babbitt Building is being torn down, to be replaced by a five story building with modern improvements.

New York City.—Plans have been drawn for a new playhouse to be erected on the site of the burnt H. R. Jacobs Theatre; Architect Wm. J. Fryer, 19 Broadway....Adam E. Fischer will erect a seven story mercantile building at 70-72 West Houston st ..Robert T. Hotcroft will build a seven story warehouse on east side of West Broadway, north of Grand st., which will be provided with an electric elevator, electric wiring and fittings, etc.; Architects Neville & Bagge, 215 West 125th st....Plans are nearly completed for the new building to be erected for the New York Life Insurance Company, on Broadway near Leonard st.; estimated cost, $1,250,000; Architects McKim, Mead & White, 160 5th ave....Albert Sichel, 209-217 East 22d st., will erect a six story factory, to be occupied by Lehmaier, Schwartz & Co.; Architect W. Wheeler Smith, 7 Wall st....John E. Kaughran will erect at 89 Walker st. a seven story mercantile building, to be equipped with elevators, steam heating appliances, electric wiring, etc.; Architect Richard R. Davis, 247 West 125th st....Architects Harding & Gooch, Postal Telegraph Building, will prepare plans for the eighteen story building to be erected for the Commercial Cable Building Company in Broad st., on the site of the old Delmonico building....It is reported that work on the new Astor-Lenox-Tilden Library Building will be begun November next; the trustees of the library fund have received from the heirs of Samuel J. Tilden $2,000,000 of the $6,000,000 bequeathed for a public library....Wm. W. Astor, 21 West 26th st, will build 4 five story dwellings at 721-723 5th ave., to cost $100,000; Architects Clinton & Russell, 32 Nassau st....Mrs. C. F. Schieffelin, 7 West 36th st., will build a five story dwelling at 5 East 76th st.; Architects Parrish & Schroeder, 1 Madison ave....Charles Buek will erect a row of private dwelling houses on north side of West 72d st., west of the Boulevard; Architect Henry F. Cook, 264 Columbus ave....Pinkus Nathan, 48 East 79th st., will build a four story brick dwelling at 31 West 86th st., to cost $45,000; Architect Albert Wagner, 67 University Place....Robert O. Connell and Edith L. Smith will build a five story brick store and flat cor. of Greenwich and Liberty sts.; Architect Cyrus L. W. Eidlitz, 160 5th ave.

Philadelphia, Pa.—Plans have been completed for the eight story addition to the wholesale department of the Sharpless Bros. stores, at 805 Jayne st.

Portchester, N. Y.—James W. Quintard is having plans drawn for a $100,000 residence in Portchester.

Providence, R. I.—Lloyd Tillinghast, the well-known restaurateur, has purchased the property bounded by Washington, Eddy, Wooster and Cove sts., and will probably erect a four story building, to cost not less than $100,000.

Somerville, Mass.—Designs for a new city hall on Central Hill, cost not to exceed $200,000 will be received until Oct. 16th.

St. Louis, Mo.—The 19th Century Building Co., 813 Chestnut st., will erect a ten story building on north side of Olive st., between 9th and 10th sts., for an office and theater building, to cost $1,000,000; passenger elevator, electric lighting, etc.; Architects Raeder, Coffin & Crocker, Chicago, Ill.

INCORPORATIONS.

The Elmira Safety Appliance Company, Elmira, N. Y—to manufacture electric engine stops, auxiliary governors, circuit breakers, etc. Capital stock, $5,000. Directors: Charles J. Langdon, George M. Diven, W. N. Eastabrook, James C. Miller and W. Mitchell Wood, all of Elmira.

The Lewiston and Youngstown Frontier Railway Company, Buffalo, N. Y.—to operate a street surface road by means of horses, electricity or any other motive power than steam, from the town of Porter, north of Youngstown, to Lewiston. Capital stock, $60,000. Directors: O. P. Letchworth, Frank M. Hayes, Henry C. Howard, A. J. Wheeler, Edwin T. Evans, L. D. Rumsey, F. R. March, Joseph L. Hunsicker, all of Buffalo, and A. H. Dutton, of Youngstown.

The Livonia and Lake Conesus Railroad Company, Livonia, N. Y.—to build a six-mile railroad from the New York, Lake Erie and Western railroad at Livonia to Conesus Lake, wholly within the County of Livingston. Capital stock, $60,000. Directors: Francis D. Hunter, David L. Gray, New York; William D. Blake, Tompkinsville; Walter E. Ayres, Harry H. Ward, Buffalo; Henry B. R. Potter, Edward F. Burns, Jersey City; Clarence P. Moore, Passaic; Chester C. Burritt, Bayonne, N. J.

The Bryant Zinc Company, Chicago, Ill.—to manufacture, buy and sell electrical and other articles. Capital stock, $2,500. Promoters: Geo. Bryant, W. W. Salmon, J. A. Wilson.

The Bethel Electric Light and Power Company, Bethel, Vermont—to furnish light and power for sale. Capital stock, $15,000. Promoters: W. H. Creamer, A. A. Brooks, R. M. Chase, M. A. Moody, Geo. H. Tupper, Bethel.

The Ascher Heating and Plumbing Company, Des Moines, Iowa—to engage in plumbing, gas fitting, electric light fitting, steam fitting, etc. Capital stock, $2[illegible],000. Promoters; O. K. Ascher, Will Scoville.

The Osceola Electric Light Company, Osceola, Iowa—to own, operate and maintain an electric light plant, sell, buy or lease real estate on which to put plant Capital stock, $20,000. Promoters: J. R. Harrison, A. W. Lewis, John W. Hall, D. Goldsmith, W. H. Hall.

The Hasbrouck Heights Light, Heat and Power Company, Hasbrouck Heights, N. J.—to make and sell gas for lighting streets, manufacture electricity for heat, light and power. Capital stock, $50,000. Promoters: Edward M. Anson, Geo. Broughton, Jr., Hasbrouck Heights, N. J.; Jules F. Vatois, New York City; David B. Mitchell, Brooklyn, N. Y., and John Q. Hanson, New York City.

The People's Electric Light, Heat and Power Company, Avoca, Pa.—to supply light, heat and power. Capital stock, $25,000 Promoters: Jas. Butler, Jno. A. Gillick, Michael J. McDonald, Moosic, Pa.

The Bryan, Hicksville, Mayville and Ft. Wayne Railway Company, Hicksville, Ohio—to build and operate an electric railway in Williams and Defiance Counties, Ohio, and Allen County, Ind. Capital stock, $50,000. Promoters: F. W. Horton, C. F. Swift, J. B. Colegrove, W. G. Deastman, John W. Winn, Geo. C. Serrill, John S. Hart, M. M. Hootman, W. H. Harter, J. J. Dorsey, R. M. Simons.

The Hermann Electric Light Company, Hermann, Mo.—to furnish electric lights, etc. Capital stock, $8,000. Promoters: H. C. Leisner, Geo. Mittendorf, Theo. Graf, Hermann.

The Punta Gorda Ice and Power Company, Punta Gorda, Fla.—to manufacture and sell ice and produce and transmit electric light. Capital stock, $10,000. Promoters: J. H. Farrington, Wm. S. Stetson, Lorenzo T. Blackmon, Punta Gorda.

The Consumers' Electric Company, Seattle, Wash.—to produce, transmit and furnish electrical current for light, heat and power. Capital stock, $50,000. Promoters: Thos. Boyd, A. M. Brooks, W. J. Grambs.

The Amber Investment Company, Tacoma, Wash.—to deal in real estate, electrical and street railways. Capital stock, $500. Promoters: Arthur C. Prichard, F. Bryant, F. C. Taylor, F. J. Miller, R. C. Applegate.

The Colorado Electric Heating Company, Denver, Col.——to engage in electrical heating, electric lighting, electric power apparatus of all kinds. Capital stock, $100,000. Promoters: Geo. B. Frally, J. S. J. Lallie, E. C. Ticknor.

The Kansas and Arkansas Construction Company, Kansas City, Kan.—to erect buildings, electric light and gas plants, and to build and equip railroads. Capital stock, $50,000. Promoters: W. W. Atkins, B. L. Short, C. A. Ellis, J. J. Spencer, Kansas City.

The Fort Wayne, Lake Everett and Columbia City Street Railway Company, Fort Wayne, Ind.—to organize, build, equip and control and operate an electric street railway in Ft. Wayne. Capital stock, $300,000. Promoters: Chas. E. Everett, Wallace E. Dowd, Wm. Geake.

The Columbia County Electric Railway Company, Greenport, Columbia County, New York—to operate a street surface electric road for a distance of fifteen miles between Hudson, Philmont and Stockport Station. Directors: Hiram McGonegal, of New York City; Walter S. Wales, of Syracuse, and A. J. Powles, R. J. Hodge, Charles S. Rogers, Wm. H. Van Tassel, Henry H. Smith, Sheldon B. Cook and Wm. J. Phillips, of Hudson, N. Y.

The Dickinson Electric Supply Company, New York City. Capital stock, $10,000. Directors: Henry S. Ritter, Henry H. Dickinson and Allen S. Goodacre, of New York City.

The Great Western Light and Power Company, Des Moines, Ia.—to supply electric light and power. Capital stock, $250,000. Incorporators: E. P. Thompson and N. A. Walker.

The American Incandescent Gas Company, Kansas City, Mo.—to establish a plant for the manufacture of appliances for making gas and electric light. Capital stock, $1,000,000. Promoters: A. E. Stilwell, George M. Meyers, E. L. Martin, E. P. Pratt, J. McD. Trimble, Arthur A. Mosher, Robert Gilham, George Matthews, Robert B. Cone, Ira C. Hubbell, and F. B. Wilcox, of Kansas City, and Thomas Hennessy, of Grand Falls, S. D.

The Colorado Gold Electric Extraction Company, Colorado Springs, Col.—to do a general mining and milling business by electrical process. Capital stock, $1,000,000. Promoters: Robert McKnight, G. M. Taylor, J. R. McKinnie, Colorado Springs.

MOONLIGHT SCHEDULE FOR THE UNITED STATES.

ELECTRICAL PATENT RECORD.

Letters Patent Issued August 27, 1895.

ELECTRIC RAILWAYS AND APPLIANCES.

545,070. Underground Electric Railway. David F. Graham, Springfield, Ohio, and William P. Allen, Chicago, Ill., assignors of one-third to Oliver S. Kelly, Springfield, Ohio. Filed June 21, 1894.

545,073. Trolley. Julius L. Hanson, Omaha, Neb. Filed June 4, 1895.

545,158. Electric Railway. John C. Henry, Westfield, N. J. Filed April 20, 1895.

545,157. Trolley-Line Clamp. Warren J. Belcher, Hartford, Conn. Filed April 11, 1895.

545,204 Conduit Electric Railway. Charles H. Johnson, San Jose, Cal. Filed Feb. 23, 1894.

545,208. Underground Electric Railway. Emma E. Moore, Chicago, Ill. Filed Nov. 16, 1894.

545,230. Automatic Switch for Electric or Cable Railways. George T. Janvrin and Frank J. Conlon, Brooklyn, N. Y. Filed Dec. 12, 1894.

545,358. Trolley-Controller for Electric Railways Leonidas W. P. Gray and Philip G. Doescher, New Orleans, La. Filed May 23, 1895.

545,393. Guard and Guide for Electric Trolleys. John R. Trisler, Westwood, assignor of one-half to Joseph H. Moore, Cincinnati, Ohio. Filed June 1, 1893.

545,404. Electrically-Operated Mine-Car. Harry B. Dierdorff, Columbus, Ohio. Filed Dec 24, 1889.

ELECTRIC LIGHTS AND APPLIANCES.

545,359. Electric-Arc Lamp. Haydn T. Harrison, London, England. Filed Nov. 19, 1892.

DYNAMO ELECTRIC MACHINERY, ETC.

45,042. Hysteresis-Compensator. Bruno Abdank-Abakanowicz, St. Maur, France. Filed March 17, 1893.

545,1[illegible]1. Means for Synchronizing Electric Motors. Elihu Thomson and Edwin W. Rice, Jr., Swampscott, assignors to the General Electric Company, Boston, Mass. Filed March 8, 1893.

515,282. Means for Indicating Coincidence of Phase of Two Alternating or Polyphase Current Machines. Johannes H. F. Gorges, Berlin, Germany, assignor, by mesne assignments, to the Siemens & Halske Electric Company of America, Chicago, Ill. Filed April 4, 1894.

545,347. Commutator or Collector Brush. Charles L. Coffin, Detroit, Mich. Filed Feb. 5, 1895.

545,405. System of Electrical Distribution. Thomas A. Edison, Llewellyn Park, N J. Original application filed Dec. 6, 1886. Divided and this application filed Aug. 29, 1887.

TELEPHONE AND TELEGRAPH APPARATUS.

515,191. Telephone Holder and Cut-Out. Arthur F. Boardman, Somerville, assignor of one-half to James D. Leatherbee, South Braintree, Mass. Filed Jan. 2, 1894.

545,2[illegible]3. Combined Telephone-Receiver, Support and Switch. George F. Shaver, Yonkers, N. Y., assignor to Amy R. Shaver, same place. Filed Dec. 6, 1894.

515,402. Telephone and Return-Call System. Thomas R. Brimmer, Baltimore, Md., assignor, by direct and mesne assignments, to the North American Interior Telephone Company, of Baltimore City. Filed Aug. 16, 1894.

515,4[illegible]6 Telephone. George F. Shaver, Yonkers, N. Y., assignor to Amy R. Shaver, same place. Filed June 8, 1895.

BATTERIES.

545,390. Secondary Battery. Illius A. Timmis, London, England. Filed Feb. 28, 1895.

MISCELLANEOUS.

545,0[illegible]9. Electric Annunciator. George J. Galbraith, Boston, Mass., assignor to the Electric Gas Lighting Company, same place. Filed April 27, 189[illegible].

545,091. Electric Gas-Lighting Apparatus. James W. Palmer, Nashua, N. H., assignor to the Electric Gas Lighting Company of Maine. Filed Jan. 9, 1895.

545 149. Electromagnetic Tool. Charles F. Carpenter, Louisville, Ky. Filed Aug. 20, 1894.

545,296. Electric Conduit. Charles L. Kintner, New York, N. Y. Filed March 16, 1893.

515 82[illegible]. Electric Target. Milton T. Weston, Kenton, Ohio, assignor to the Halcyon Cycle Company, same place. Filed Dec. 8, 1894.

THE TELEPHONE WORLD.

Competition in the South.

The Inter State Telephone and Telegraph Company of Durham, N. C., is actively engaged in establishing a competing telephone service throughout the South. The company began business by purchasing the Harrison telephone plant in Durham and reorganized with the following officers: L. A. Carr, of Durham, president; Julian S. Carr, of Durham, secretary and treasurer; W. W. Shaw, of Durham, auditor, and Edgar L. Miller, of Maryland, general manager, assisted by Geo. P. Lowe, superintendent of construction. The directors are L. A. Carr, Julian S. Carr and George W. Watts, of Durham, and Dr. P. D. Fahrney and James E. Walker, of Maryland. The company has practically rebuilt the Durham plant and is completing a large installation at Winston-Salem. At the latter place the local Bell Company is fighting hard, but the new company is encouraged and backed by the Chamber of Commerce and the Merchants and Traders' Union and is sure to win. The Inter-State Company has obtained franchises in the more important cities and towns in North Carolina and has arranged to connect Raleigh, Goldsboro, Winston, New Berne, Charlotte, Greensboro, Oxford, Henderson and other places. Work of constructon is already in progress at Wilmington, Goldsboro and Raleigh.

"American" Telephones in Demand.

The demand for the products of the American Electric Telephone Company, Kokomo, Ind., is not limited to the United States, as recent orders from foreign parts show. The company has lately made shipment of 100 telephones to Siberia, via Hankow, China, and transports, also shipments to Australia and South America.

Among the domestic contracts recently secured are New Castle, Pa., for 300 telephones; Greensburg, Pa., 150 telephones; Shreveport, La., 00 telephones; Monroe, La., 2 0 telephones; La Crosse, Wis., 500 telephones; Joplin, Mo., 200 telephones; Carthage, Mo., 20 telephones; Webb City, Mo., 100 telephones; Prescott, Ariz., 150 telephones; Logansport, Ind., 200 telephones; Huntington, Ind., 100 telephones; Defiance, O., 200 telephones; Macomb, Ill., 100 telephones

Telephone Competition in Iowa.

The Western Telephone Company, composed of Iowa capitalists, has in contemplation a widely extended telephone system in Iowa and adjacent States. The company has already constructed over 200 miles of line in the northern part of Iowa and secured control of nearly a thousand miles of leased line in that State and Minnesota. Work on other lines will be pushed rapidly, hoping to have a thousand miles of its own line in operation by spring. The intention is to reach as far east as Chicago and west to Sioux City or Sioux Falls, with a line to the north, touching Minneapolis and St. Paul. The officers of the new company are as follows: President, J. F. Case, Sumner; vice-president, C. Webster, Waucoma; secretary, T. H. Potter, Corwith; treasurer, T. H. Way, Britt.

A Cable to Hawaii.

Both Houses of the Legislature of Hawaii have ratified a contract made with Col. Z. S. Spalding to grant an annual subsidy of $40,000 and an exclusive franchise in return for laying and operating a cable from San Francisco to Honolulu. Application will be made at the coming session of Congress to secure a similar subsidy from the United States. It is estimated that the cost of the cable will exceed $1,000 000. Col. Spalding is one of the wealthiest sugar growers of Hawaii and is backed in his present enterprise by European capital.

The Svengali Buncophone Eclipsed.

Describing the new form of telephone instrument to be used at Kingston, N. Y., the *Freeman* of that place says:

> The telephone is so constructed that it can be kept in the drawer of a desk, and be pulled out only when needed It is guaranteed to be proof against falling on the floor, or out of the window, making it available as a weapon of offence against backyard cats. Its operation is so perfect that one can stand several feet away or even with his back to the instrument and still converse with remarkable ease.

The Gould-Smith Switchboard.

The Eastern Electric Company of Philadelphia, controlling the Gould-Smith patents on non-infringing switchboards, has just closed with a Pennsylvania telephone company a contract for a 400-wire board. This board was selected after a careful personal examination by the officials of the purchasing company of the many now on the market.

Telephones in Japan.

The cost of telephone rentals in Japan is $35 a year. There are now six exchanges in Tokio, two in Yokohama, three in Osaka and two in Kobe. There are about 2,672 subscribers.

The Memphis Telephone Company, Memphis, Tenn., has been granted a franchise in that city and has contracted with the American Electric Telephone Company, Kokomo, Ind. for the erection of a $100,000 plant. The city ordinance prohibits the Memphis Company from making any deal that will prevent the erection and maintenance of the plant, nor shall the company sell or give up its franchises, nor shall it do any act or thing by which its management or control shall be turned over or consolidated with the Cumberland Telephone and Telegraph Company, or do anything to deprive the city and its citizens of the competition in telephone service. In case of the violation of any of these agreements the company shall become bound to pay to the city of Memphis, as liquidated damages, the sum of $50 000, the sum to be a lien upon the works, franchise and all property of said company. Such violation shall authorize the city to have a receiver appointed, to hold until the full amount is paid.

The Home Standard Telephone Company has been granted underground rights at Albany, N. Y. The conduit system is to be completed within five years and is to be provided with ample space for use of city department wires for which no rental is to be charged. At a meeting of the directors of the company held last week a report was presented, showing that the capital stock of $ 50,000 has all been paid in. Plans for the construction of the line are to be submitted next week. The officers elected are: President, John M. Bailey; vice-presidents, James Rooney and Henry Russell; secretary, Charles L. A. Whitney; treasurer, Howard Hendrickson; general manager, William A. Graves.

The Philadelphia *Press* says that there is reason to believe that the franchise granted the Mutual Automatic Telephone Company of that city has passed into the hands of the Standard Telephone Company, and that an effort will shortly be made to construct the line. Some time ago J. W. Darlington was engaged as engineer to prepare plans for the conduits, and it is understood he will be engaged to superintend the construction of the plant of the new company.

The Central Union Telephone Company has reduced its rates at Wabash Ind., from $3 and $2 per month to $1 and sixty cents. The cut was precipitated by the Home Telephone Company which is just completing its new system and which proposed to furnish service at $2 and $1.50. The Home Company has 180 three-year contracts and expects to make a successful fight.

The Bell Telephone Company has established a "measured service rate" in Philadelphia, the adoption of which is optional with subscribers. Under this system the subscriber contracts for any number of exchange calls over 600 per annum, the price being based on the number of calls.

The Commercial Telephone Company of Alameda County, California, has presented a bid for a franchise in Oakland, that State, agreeing to give $50 upon the awarding of the franchise and in addition to pay the city semi-annually one-half of one per cent. of the gross income of the company.

A telephone line is to be built from Athens to Atlanta, making connections with Lexington, Jefferson, Crawford, Harmony Grove, Winder, Maysville, Hoschton and Pendergrass.

Among the recent large contracts closed by the Columbia Telephone Manufacturing Company New York, are Sacramento, Cal.; Ocala, Fla.; San Jose and Santa Cruz, Cal.

The city council of Lancaster, O., is considering the question of granting a franchise to the new telephone company represented by H. W. Winkoop and A. L. Conger.

A subscription paper is being circulated in Ross County to rebuild the old telephone line from Chillicothe O., to Andersonville and thence to Yellow Bud.

The Wausau Telephone Company, Wausau Wis., has contracted with the Standard Telephone and Electric Company, Madison, Wis for its exchange equipment.

The rush of new subscribers has compelled the Home Telephone Company of Mobile, Ala., to order 100 additional 'phones. Over 500 are already connected.

F. R. Phillips, of Covington, Ky., has organized the Cynthiana Telephone Company, with a capital stock of $10,000.

Representatives of the Stromberg-Carlson Telephone Company, Chicago, are organizing a local company at Galesburg, Ill.

The New York and New Jersey Telephone Company has been granted permission to lay conduits through the streets of Harrison, N. J.

Capitalists of St. Joseph, Kansas City and other towns, have organized a telephone company in Topeka, Kan., with a capital stock of $2,000 000 It is known as the National Long Distance Telephone Company and will combine all the other companies except the Bell.

C. S. Bash, representing the Fort Wayne Telephone Company, has made application for a franchise at Fort Wayne, Ind.

The local exchange of 100 subscribers erected at Rochester, Minn., by F. S Haines and J. A. Melone, has been put in operation.

Attorney H. K. Hawes is the leading spirit in the movement for a competing telephone exchange at Springfield, Mass.

The Mineral Point Telephone Company, Mineral Point, Wis.; capital stock, $1 500. Incorporators, W. R. Smith, P. Allen, Jr., N. H. Show and others.

The California Telephone and Construction Company have been granted a franchise at San Jose, Cal., for 25 years.

A franchise has been granted at Kenosha, Wis., to the National Telephone Construction Company of Milwaukee.

The Delaware County Telegraph and Telephone Company, has asked for a franchise at Chester, Pa.

All towns and villages between Patchogue, L. I., and Brooklyn now have telephone connections.

The Anthony Company of Cincinnati, O., is seeking a telephone franchise at Des Moines, Ia.

The city council of Menasha, Wis., has refused to grant a franchise to Fred Kraus, of Milwaukee.

A. H. Bartley has been granted a franchise to establish a telephone service at Sidney, N. Y.

The Southern Michigan Telephone Company is seeking a franchise at Schoolcraft, Mich.

Col. William P. Fogg, of New York, is in Cleveland organizing a telephone company.

The city council of Hearne, Ga., has granted a franchise for a telephone exchange.

The Baraboo Telephone Company has asked for a franchise at Baraboo, Wis.

A franchise has been granted to the local telephone company of Waycross, Ga.

The Central Telephone Company will erect a $75,000 building at Toledo.

Fayette and Vernon, Ala., are to be connected by a telephone line.

A telegraph line is to be built from Wickliffe to Paducah, Ky.

A telephone company is being organized at Tarboro, N.C.

New Companies Incorporated.

Articles of incorporation of the Baraboo Telephone Company, Baraboo, Wis., have been filed. The capital stock is to be $3 600.

The Cedar Valley Telephone Company, Waterloo, Ia. Capital stock, $100,000. Incorporators: D. C. Bickley, O. B. Dennett and J. K. Joder.

Gen. James S. Clarkson and A. T. Nye have filed articles of incorporation at Camden, N. J., for the Standard Telephone and Telegraph Company of Philadelphia. Capital stock, $250,000.

The Garrison and Duncan Telephone Company, Garrison, Col. Capital stock, $5,000. Incorporators: Paul B. Gates, Wesley Staley, Charles R. Foster Larin O'Bay.

The Greenwood Telephone Company, Greenwood, Ind.—to establish a telephone system. Capital stock, $3,000. Incorporators: Grafton Johnson, J. J. F. Crawford and Albert Johnson.

The North English and Green Valley Telephone Company, North English, Ia., has filed articles of incorporation

The McPherson Telephone Company, McPherson, Kan. Capital stock, $5,000. Directors: J. E. Wright, J. R. Wright, J. G. Maxwell, L. M. Waitt and H. G. Smith.

EDITORIAL NOTES.

> **There are still left in this trade a large number of men who have entered into it for their life work. They may be disheartened, but they have not given up. It is for them that we write. To them we present our argument, and to them we must all look for the re-establishment of business principles, the reinforcement of the doctrines of common sense.**
>
> **It is for these men to consider just why wrong has temporarily triumphed over right, why it was possible for the tricksters and adventurers to bring the industry to its present condition.**
>
> **And when these questions receive careful thought the only answer possible is that the electrical press has not done its duty.**
>
> **If the "Electrical Engineer," the "Electrical World," the "Electrical Review" and the "Western Electrician" had faithfully done their duty by the trade they claim to represent, whose best interests they claim to guard, the present situation would never have confronted us.—" ELECTRICITY," June 5, 1895.**

The Berliner Microphone Case. It is announced that the United States Court of Appeals, on motion of Mr. Storrow, of the Bell Telephone Company, has ordered that a mandate issue in the Berliner patent case, and that in consequence counsel for the United States, by leave of the Court of Appeals, has taken an appeal to the United States Supreme Court, thus leaving the case in status quo until the hearing takes place at Washington. By the terms of the act of Congress creating circuit courts of appeal the judgments of those courts are final in all cases arising under the patent laws, except where the judges certify a case to the Supreme Court, or where the Supreme Court directs the case to be brought before it for review on a writ of certiorari. The Government representatives say that a case involving the question whether or not the United States has the right to sue for cancellation of a patent is vastly different from a controversy between two private parties over a patent right, and that upon that point an appeal to the Supreme Court from the judgment of the Court of Appeals was demanded.

If, as seems to be the case, the Government is the only party that can bring the Berliner case directly before the Supreme Court, we think the independent telephone men are wrong in their idea that the Government should keep its hands off. They are certainly right in the attitude they propose to assume of defence of all cases brought in the lower courts for infringement of the patent, for no stone should be left unturned to defeat what they honestly believe to be an injustice. But if this is *all* that is done, what does it mean? What did it mean in the Bate Refrigerator case? It meant years of litigation before it was brought to the Supreme Court, and if the Berliner patent were to go through the same course as it would if the Government had kept its hands off it would be many years before it could be authoritatively decided either one way or the other. Those who are now in the business would better know now whether they are to continue to live or to die than to lead the precarious existence which must follow a protracted litigation leading through the legitimate and usual channels to the United States Supreme Court.

How many could survive such an ordeal? Probably of those who could few would desire to. Death—certain death, would be preferable to the lingering illness which the independent lamp business suffered pending a final hearing.

We are aware of the distrust which the Government's conduct of the Berliner case engendered, and have commented in no uncertain terms upon the almost disgraceful manner in which its case was presented. That case was a disgrace to the Government and a disgrace to the legal profession, and none have felt it more keenly than we. But if the Government is the only party who can bring this question to immediate issue, we are strongly in favor of such action. It is not only "any port in a storm," but in this case "the nearest port" in a storm which few can weather if they must battle against it for a protracted period.

The associations of independent companies, however, should see to it that the Government's next case is not made the farce that the former one was. With able attorneys and counsel, with the *moral* support which the independent companies if working in harmony could bring to bear, the legal representatives of the Government which is responsible for the conduct of the case would not *dare* to repeat the *fiasco* of the former hearing.

With all these forces added to that of public opinion intelligently aroused to the occasion, an Attorney General who would permit such slipshod work as that to which we advert would be eternally disgraced. We believe that the presence of attorneys for the Associations at the hearing, known to be ready to assist or to criticise as occasion required, would insure the best efforts of those assisting the Attorney-General in the conduct of the case, and insure the strongest possible presentation of the same. A decision rendered by the United States Supreme Court under these circumstances would at least be according to law. It would not only be this, but satisfactory even if it went in favor of the Bell Company, for then the people would know beyond question whether or not they had a right to use devices covered by the broad patent which now stands to the credit of Emile Berliner.

In the meantime let the Associations fight every step in the lower courts, but by all means let them exert every influence and assistance to bring the question to final hearing at the earliest possible moment, even if the most feasible means be the Governmental one which has once been tried and found so sadly wanting.

* * *

Electric vs. Steam Locomotives. The daily press and, to a less extent the technical press, have been much occupied of late in discussing the question of relative service of electric and steam locomotives. In discussing this question the element of speed has often been considered the dominating one, and if we are to take the lay press as a guide it is still a moot question as to which of the two can get up the higher speed. To the electrician and railway manager this is by no means the controlling feature. We all know that the difference in time between two points by express and way trains is due far more to the more frequent stops made by the latter than to any higher maximum speed attained by the former.

As an illustration in point we may mention the recent rivalry in England between the West Coast and the East Coast lines connecting London and Aberdeen, the distance by the former being 540 miles and by the latter 523. By reducing both the number of stops and the weight of trains, first one and then the other road beat previous records until the West Coast line covered its 540 miles in 512 minutes, or at a rate of 63½ miles per hour, thus beating the world's record, viz., that of the Empire State Express, which in September, 1891, covered the ground between New York and Buffalo at a rate of 61.56 miles per hour.

The maximum rate of the Empire State Express (Locomotive No. 999) was, we believe, 112 miles an hour, and this doubtless marks pretty nearly the maximum speed attainable to-day by means of steam locomotives drawing ordinary trains. This locomotive has drivers 86 inches in diameter and cylinders of sufficient diameter to impress upon these drivers the necessary power to overcome friction, air resistance and haul the required load at the given speed. But even at the relatively low piston speed required by these large drivers it is probable that the capabilities of the boilers and the exhaust valves had reached a limit. It has been stated that the Empire State Express could not start itself from rest with load, and required assistance at such times from another locomotive. Whether this be true or not, it was amply demonstrated that notwithstanding the enormous maximum speed attainable by No. 999 it lacked in a marked degree one feature essential to high average speed, viz., the ability to accelerate and retard its speed with that facility required for the best rapid transit service where intermediate stops are involved. Part of this deficiency seems to be inherent in types of steam locomotives calculated for highest maximum speeds, and another more important part is due to the enormous weight, not only of the trains as nowadays constructed, but of the locomotive in order that it may have sufficient tractive ability to pull the train at these high speeds.

These great train weights have been the growth of a comparatively few years and were the subject of an able editorial by that veteran railroad authority, M. N. Forney, in the last number of the *American Engineer and Railroad Journal.* He regards them as unnecessary, and states that the only excuse for them seemed to be the greater carrying capacity per train mile which they seemed to give, but he points out that the weights have increased unnecessarily even for this.

But certain it is that there is some limit to the speed at which heavy reciprocating parts can be safely operated. It is certain that, however extended that limit might be, it will be exceeded by the safe limit at which purely rotary motion can be safely operated. It has been well demonstrated that the electric motor on account of its purely rotary motion has a higher tractive effort per pound of weight than has the reciprocating engine. So marked is the advantage of the rotary motor that in the early days of electric traction many sought to explain it by assuming a sort of incipient weld between the wheel and the rail where the ground return was employed. It is now known that the greater tractive efficiency is due entirely to other causes, but the fact is no longer disputed. This being a fact, it follows that with a given weight on the drivers an electric locomotive can draw a heavier weight, or with a given available power and the same weight can attain greater speeds. It also follows theoretically, and this has been abundantly demonstrated in practice, that the electric motor can accelerate and retard its motion with greater facility; so that here, too, it has the advantage over the steam locomotive in the rapid transit it can afford.

The speed which an electric locomotive may attain is practically limited only by the ability of its revolving parts to resist centrifugal disruption. This does not necessarily refer to the speed of the armature or its strength, for it may be geared up instead of down, as is the practice at present, and the car wheels themselves become the limiting parts, but doubtless long before this becomes true the question of roadbed and ability of trains to keep on the rails will have stepped in to claim attention.

It is becoming more and more the belief of railway engineers that with a straight and well laid track far higher speeds than have yet been attained will be perfectly safe, so far at least as derailment is concerned, but it is a fact that our roadbeds as at present constructed will not permit much higher speeds than those already on record.

In Dr. Duncan's inaugural address to the American Institute of Electrical Engineers, he stated that the field for electric railway development lay along the line of more frequent train service. This will permit of lighter trains than are possible or desirable with steam traffic, and this will conduce to greater possibilities of speed in the electric service.

But this greater speed cannot be safely attained unless both track and motor are provided specially for the purpose. The recent reports of speed attained on the Nantasket Beach line are not to be credited, first because the motors were not designed for any such speed, and would therefore long before such speed was attained be generating a counter E. M. F. greater than that of the line, and second because on such a track such speeds would be suicidal.

* * *

WE understand that some individuals, who in the past have been somewhat proficient in the fine art of electric financing, express strong disapproval of the course of this paper in attacking and exposing the rascality in only one concern, and that they suggest that there are others that need and deserve our attention just as much, and intimate that we are neglecting our opportunities and evading our duty by apparently shutting our eyes to or winking at the very obvious sins and misdeeds of these others. We beg to assure our more or less worthy critics that ELECTRICITY will, in due season, deal out a fair measure of justice to any and all offenders against and transgressors of the laws of business morality, and that the expressed desires of our critics shall be more than satisfied. But just now we are engaged in dealing with what, in our opinion, is the biggest and worst case, and one such big case at a time, and that properly handled, is more to our taste than is rambling from one to another. Be patient, ye croakers, your wishes shall receive our most distinguished consideration and most vigorous attention—when *we* are ready. The complaints of neglect some now vociferously utter may then be turned into wailings.

We well know that we are only just on the threshold of our labors, and that there is much to be done in the future. Do you understand our position now? If not, and any further information is desired, please notify us.

We are always most happy to receive and listen to any suggestion concerning the big task of purifying the electrical industry which we have on our hands, and shall be especially thankful for any suggestions or recommendations offered in good faith by any one whose opinions are entitled to consideration; but ELECTRICITY cannot be swerved from its policy, deliberately decided upon after thorough consideration, by trivial or insolent advice.

Under the Searchlight.

Views and Opinions on Timely Topics.

AMONG the few members of the electrical fraternity of America who do not approve of the policy of ELECTRICITY, none has been more bitter (or less frank) in his criticisms than Mr. J. G. White. Of course no newspaper can suit every one, and ELECTRICITY does not try to. We would consider it a positive disgrace if this paper met with the approval of a certain element in the trade. There are those who see their occupation going from them by reason of ELECTRICITY'S exposure of electrical financing methods. These methods are not wholly confined to the G. E. Company. Mr. Coffin has had many imitators. Even now there are deals on foot as to Alton, Ill., to float securities in an amount largely in excess of anything warranted by the earning capacity of all the electrical enterprises in the town. The fact that ELECTRICITY stands ready to analyze each and every deal of this nature at the proper time cannot fail to render the paper distasteful to such men as Mr. J. G. White and Mr. J. T. Porter. However, we can stand their enmity better than their friendship.

* * *

A MATTER OF TECHNIQUE.

Among the many technical electrical journals of the day, perhaps no one is more entertaining and instructive than ELECTRICITY. It has a hobby of attacking some of the great electrical concerns of the country which becomes tiresome at times from constant repetition, but the magazine keeps abreast of the electrical thought of the day.

ELECTRICITY has another hobby which it rides with a persistence worthy of a better cause, and which does not add to its reputation for fair dealing. According to this sprightly magazine, no electrical fact, however simple and non-technical, can be correctly stated by a daily non technical newspaper. Commenting on a semi-technical statement in one of the Boston papers, ELECTRICITY says, in the current number:

> "We give space to this matter to convince the public that daily paper statements in regard to electrical subjects or electrical companies are totally unreliable."

That this charge, which is found in one form or another frequently in journals which are especially devoted to the technique of electricity, is not only gratuitous but untrue is now very plain. Whenever an investigator chances upon a phenomenon of the mysterious agency, which they all know so little about, his name is immortalized by attaching it to an alleged new unit.

And now, because a reporter occasionally becomes tangled in the mazes of these personal *terms*, electrical writers announce that electrical news in the daily papers is totally unreliable.

The fact that an enterprising individual establishes a monthly or weekly magazine devoted to technical papers on the art. does not of necessity preclude the daily newspapers from stating, plainly, clearly and correctly, facts of interest to the general public regarding the progress of the art. With all their assumption of superior knowledge, not one of them can to-day explain, in terms which can be comprehended by the most intelligent reader—whether he be technical in his habit of thought or otherwise—what this thing they call electricity is. While assuming to be the only safe and authorized pilots through the mysterious sea which surrounds them all, they do not pretend to be able to box their compass.

While statements of fact by the daily newspaper are not arrayed in the mysterious nomenclature of which the technical journals seem to desire to claim the monopoly, there is a growing tendency to let the people know something about the art, and it is presumptuous to say that statements made by the daily newspapers are totally unreliable. On the contrary, such statements will stand the test of criticism far better than will the statements of general facts made by the technical press.

[The above abstract from an editorial which recently appeared in the Rochester *Democrat and Chronicle* requires, we think, a few words in reply. In the first place the quotation of ours which gave rise to the above remarks was not, as seems to be assumed, due to a misuse of technical terms by the Boston paper, but a confession by the editor of the Boston *Transcript* that the article criticized was not inserted because it was supposed to be accurate, but simply to attract attention, and because the editor declined to correct some erroneous statements when they were pointed out by a correspondent.

It is not that the daily press cannot distinguish between that which is true electrically and that which is false, but that it does not *try* to that we find fault with. The daily press is a large beneficiary of the electrical charlatans whose advertisements of electric belts, electropoises, earth magnetos, thermo-ozone batteries, *et id genus omne* put them under obligations to print in their reading columns matter of the most sensational kind regardless of its truth or probability. What the daily press most seems to want is something sensational, and it gets it. We can well forgive the misuse of technical terms if only the facts are given, but when we see an otherwise respectable paper upholding charlatanism in its most flagrant form—and what is more doing so *knowingly*—we are disgusted. We are glad to believe that the *Democrat and Chronicle* does not do this, but it is doing something nearly as bad in criticizing us for calling attention to the misdeeds of others.

Our critic's idea of the origin of electrical units is something amusing. A new unit is only adopted by international agreement, and at the last Electrical Congress (1893) there was but one addition to the list. And his statement that we cannot yet explain what electricity is, and do not even pretend to be able to box our own compass, is made with an assurance that is charming. We have the same difficulty in defining electricity that we have in defining any of the ultimate elements of time, space, energy, matter. We cannot tell positively what electrical energy is any more than we can tell what energy is, but we know more about it than we do of gravity, of light or even of mechanical force.

Electrical science is becoming rapidly popularized, and the daily press might become a potent factor in this popularization, but let it discriminate against statements which are at variance with the fundamental law of the conservation of energy—let it refuse to sound the trumpet of the charlatan, if it would command respect from the technical press. Then let it make misuse of electrical terms, if it can do no better, and no harm will be done. This is a very mild sin but is a sin that the best edited papers will avoid as they avoid the use of ungrammatical expression.—ED]

* * *

OUR London correspondent gives this week some figures on the results of the operation of accumulators for traction purposes on the Birmingham system which are of some interest. The only data throwing a favorable light on storage battery traction are provided by the manufacturers of batteries. The figures of actual operation show a uniform poor result as compared with any other modern traction system.

* * *

"*As a voltage of* 10,000 *has proved to be entirely practicable, a territory within a circle of* 100 *miles diameter can be as easily served from a central point as can one town from its own plant employing the usual voltage*"—Electrical World.

* * *

THEIR VALUE.

Charles H. Bigelow, E. M. Van Duzee and Charles F. Miller, the appraisers of the A. H. Wilder estate, have filed with the clerk of the probate court at St. Paul a schedule of the valuations of the estate, in conformity with the order of the court. The total is $1,987,569.26. Among the items are:

	VALUE.
Capital stock of the Electric Corporation, 5) per cent. paid on $10,0 0 subscription	$250.00
200 shares Northwest General Electric Company	000.00

On June 15, 1892, Mr. Wilder had, according to the Northwest General Electric Company's stock book, 405½ shares of Northwest General Electric stock.

* * *

IF the makers of the 100-hour arc lamps (enclosed arcs) don't take pains to publish their own successes, we don't know how they can expect to convert the people. ELECTRICITY knows of one lighting station, managed by one of the most competent men in the country, where 50 such lamps have been in use nearly a year, and a good-sized additional order was recently placed.

* * *

LEADEN REALITIES.

(From the Cincinnati Commercial Gazette.)

VALUE OF AN ELECTRIC LIGHT PLANT.

The following, clipped from one of our exchanges, would indicate that golden promises and leaden realities are not the exclusive stock in trade of industrial promoters:

"The Morristown, Tenn., Electric Light Company's plant was recently sold under foreclosure proceedings. It was bought in by the General Electric concern for $4,000, which parent concern held the mortgage that was in default. What a choice collection of wrecks the General Electric is storing up on its dry docks!"

* * *

AND now the city of St. Louis is agitating the municipal lighting station question. The supervisor of city lighting is securing estimates of the probable cost.

* * *

Truths From Our Contemporaries.

(From the European Edition of the Herald.)

We do not seem to have come to the end of the resources to be derived from ELECTRICITY.

(From the Black Diamond.)

It becomes daily more manifest that the value of ELECTRICITY is more recognized.

Electrical Switching Engines on the Bridge.

The announcement is made, upon what appears to be good authority, that the noisy and dirty steam switching engines which have up to this time been employed at the termini of the New York and Brooklyn Bridge are to give way to electrical switching engines. This is as it should be, and the innovation will be hailed with delight by all patrons of the Bridge cars.

Two G. E. Railway Deals.

THE PUEBLO ROAD REORGANIZED.

At the recent foreclosure sale the Pueblo City Railway Company's property was bid in by Albert E. Pattison, of Denver, as trustee for the General Electric Company, for $400,000, of which $23,000 was paid in cash. Of this sum $5,000 was required by the master as a deposit, and the balance was for court costs and claims audited and ordered paid. The total indebtedness of the Pueblo City Railway to the General Electric Company was $579,661.37, $500,000 of which was secured by first mortgage bonds. The other $79,661.37 was to take up a floating indebtedness. Soon after the sale there was filed with the county clerk the incorporation papers of the Pueblo Electric Street Railway Company. The capital stock was placed at $500,000. The five directors are S. Dana Greene and Howard C. Levis, of Schenectady, N. Y.; Irving Hale and Albert E. Pattison, of Denver, and H. Eugene Chubbuck, of Pueblo. Mr. Greene is president of the company, Mr. Hale the secretary and treasurer, while Mr. Chubbuck is vice-president, general manager and assistant treasurer.

The Pueblo deal was a fair sample of the Coffinesque plan of building roads as put into operation by Mr. B. E. Sunny, manager of the Chicago office. Every patriotic man in Pueblo wanted a street railway, but not one could be found to incur the risk of building it. Therefore a first-class opportunity was offered for the manufacture of bonds by the Thomson-Houston bond factory. The road was built entirely for bonds and stock. The Thomson-Houston Company received no other consideration. The capitalization was $1,200,000—$700,000 in bonds and $500,000 in stock. Pueblo has a population of 24,558. An honest capitalization, therefore, would have been, at $12.50 per capita, $306,975. The road was equipped with 24 motor cars and 16 trailers, and 35 *lb. rails* were laid for track. It never paid operating expenses, and a receiver was appointed early in 1894. There were miles of track running through the cactus brush in the outskirts, where no human being ever lived or ever will live.

In 1894 the General Electric Company claimed to own only $50,000 of stock and $50,000 of bonds on this property, having apparently disposed of $1,100,000 of the securities.

Mr. S. D. Greene should not have accepted the presidency of the reorganized company, as his appointment was an evident insult to Mr. B. E. Sunny. The Pueblo road was Mr. Sunny's own child. He should be allowed to raise it.

THE SYRACUSE "CONSOLIDATED" ROAD SOLD BY THE SHERIFF.

A few weeks ago the property of the Syracuse "Consolidated" Street Railway Company was sold by the sheriff to the bondholders of the company for $835,000.

The building of this road was another typical Thomson-Houston deal. There was a horse railway company in Syracuse owning franchises and operating in the only desirable thoroughfares. This company did not care to trade with the Thomson-Houston Company. Therefore eight short and insignificant branch lines were gathered together in a Coffinesque consolidation to furnish raw material for the bond factory. There were 31.75 miles of road, 12 miles el. and 19.75 h. The capitalization was $7,300,000, $4,000,000 stock and $3,300,000 bonds, according to the General Electric Company's books in 1894, when the General Electric Company claimed to hold no bonds, and only $20,500 of stock. The company's car equipment was as follows: 29 motors, 68 box, 21 open cars, and it owned 220 horses. A receiver was appointed in December, 1893, when interest had lapsed and there was a floating debt of $180,000. Stockholders of course get nothing, and the bondholders about 25 cents on the dollar. The Pueblo and Syracuse swindling operations were cotemporaneous with the Northwest operations to which we are now giving so much space. Pueblo was worked through the Chicago office, Syracuse through the Boston office—and everyone, East, West, North, South, under the direct supervision of Charles A. Coffin.

More Trouble For G. E.

The Siemens & Halske Co. Bring Suit For Infringement.

The Siemens & Halske Electric Co. of America have filed suit against the Metropolitan Elevated Railroad at Chicago, alleging that the latter is infringing patent No. 324,176, granted to Dr. Werner von Siemens in the United States on August 11, 1885, covering the electric system now in use on the Metropolitan road. The patent was assigned August 5, 1891, to Siemens & Halske of Berlin, and May 22, 1894, by the latter to the Siemens & Halske Company of America. The G. E. Company of New York is of course the real infringer, and the defence is in its hands. President A. W. Wright of the Siemens & Halske Co. is reported as saying: "It may be asked why did we not bring suit against the General Electric Company when it operated the intramural road at Jackson Park. The answer is simple: The road was run at a World's Fair under the direct supervision of the Government, and it was agreed should be dismantled in a certain time."

The same company also brought suit, September 5, against the Baltimore and Ohio Railroad Company, in the United States Circuit Court, District of Maryland, for infringement of patent No. 520,274, granted to Ernst Werner von Siemens on an "Improvement in Electric Railways." We understand that the overhead trolley device used in the Baltimore tunnel is identical with the device described in the Siemens patent. It is a fact, though not published before, that the Siemens & Halske Electric Company some time ago threatened to bring suit against the General Electric Company under a contract entered into by the former Edison General Electric Company for the manufacture of Siemens cables. The General Electric Company, however, agreed to pay royalties for the use of these patents, and the matter was adjusted on this basis.

American Association for the Advancement of Science.

The following titles on electrical and engineering subjects were included in the programme for the meeting of the American Association for the Advancement of Science held at Springfield, Mass., beginning August 27 and continuing until September 4:

Flow of alternating current in an electrical cable. By M. I. Pupin.

The most general relation between electric and magnetic force and their displacements. By M. I. Pupin.

The economics of engineering public works. By H. N. Ogden.

Mathematical theory of the windmill. By De Volson Wood.

Experiments on the flow of steam, and comparison of the results with Napier's formula. By J. J. Flather.

On partially continuous drawbridge trusses, with a method of deducing formulas for the reactions. By Mansfield Merriman.

On the design of fishplate joints. By H. S. Jacoby.

The perfect screw problem; illustrated by a combined ruling engine and comparator in automatic operation. By William S. Rogers.

Magnetic storms and sun spots. By M. A. Veeder.

Solar magnetic radiation and weather forecasts. By Frank H. Bigelow.

Clouds and their nomenclature. By Cleveland Abbe.

Cloud photography. By Alfred J. Henry.

Californian electrical storms. By John D. Parker.

Electrolytic reproduction of resonators. By William Hallock.

An experimental investigation of the rotary field. By H. D. Carthart.

Phenomena with electric waves analagous to those of light, with a diffraction grating. By C. D. Child.

Calcium carbide. By Prof. P. de Chalmot.

From the address by Wm. McMutrie, Brooklyn, N. Y., on "Industries and Chemistry":

In no direction has the application of the methods in the larger way, either in the laboratory or in the works, given richer yields in new material than in the varied uses of the electric current in chemical work. It has led to the production of new compounds or has increased the means for production of old ones, and through it additions are constantly being made to the store of material of such composition and properties that they must inevitably lead to further new discoveries or the establishment of new principles or laws. The electrical smelting furnace has opened up a wide field of experiment and investigation as fascinating as it is new, and it is to be expected that many additions will be made to the list of new substances through its use.

"Economics of Engineering Public Works" was the subject of Prof. Ogden's paper. He said:

Water-pipes under the care of one commission are laid in one trench; gas-pipes under another management in a second trench, and so with the sewers and the steam-pipes and the conduits for wires and for other purposes. Each company is responsible for its own ditch and its contents, but the cost of the trench is, in each case, added to the cost of the service rendered, and the community has to pay for the many managements and their lack of co-operative understanding. It is not an unknown thing, after a town is well paved, to have the pavement ruined by the subsequent laying of water and sewer pipes, with the additional expense of repaving the street over the trench.

Were all pipes put together in a suitable and accessible conduit, paid for by the managements of the different pipe lines, and were the conduits built before any of the trenches are dug, a certain net gain to the community would ensue. Conduits could in most cases be built for less than the total expense of the trenches, and could be constructed in the streets of our large cities, thus avoiding the dead loss incurred whenever the streets are torn up for repairs.

ASSOCIATION NEWS.

American Street Railway Association.

Arrangements have been completed for a special train to leave New York on October 14, at 6 P. M., for the delegates and others who desire to attend the Montreal meeting of the above Association on October 15–17.

New York State Street Railway Association.

The annual meeting of the New York State Street Railway Association is to be held at the Kenmore Hotel, Albany, on September 17 next. A long list of topics for discussion will be presented.

Pennsylvania Street Railway Association.

The fourth annual convention of the Pennsylvania Street Railway Association was held in Wilkes-Barre last week. There was a goodly attendance and a liberal number of exhibits. The papers were of rather better quality than usual, the leading one being read by Mr. A. K. Baylor, of the General Electric Company, on "Power Consumption by Electric Railways."

Canadian Electrical Association.

The fifth convention of the Canadian Electrical Association will take place at Ottawa on the 17th, 18th and 19th inst.

The following papers will be presented:

"Some Notes on the Consolidation of Two Systems of Electric Supply," A. A. Dion, Ottawa.

"The Telegraph in Canada," Chas. P. Dwight, Toronto.

"Suggested Forms for Electric Light Accounting," D. R. Street, Ottawa.

"From the Coal Pile to the Meter," Jas. Milne, Toronto.

"Some Modern Alternating Current Apparatus," H. T. Hartman, Peterborough.

"Non-Interference Duplex Relay."

"A Percentage Method for Circuit Measurements," D. H. Keeley, Ottawa.

American Institute of Electrical Engineers.

The 99th meeting of the Institute will be held on Wednesday, September 25, the date having been changed from September 18 by the committee. A paper will be presented by Charles S. Bradley, on "Phasing Transformers." The meeting of Council will also be held on September 25, when applications received from the following candidates will be acted upon: Edgar. L. Morley, New York City; Sydney B. Austin, Sidney, N. Y.; David B. Rushmore, Plainfield, N. J.; D. W. Irvine, Chambersburg, Pa.; Gustav A. Wiese, Alameda, Cal.; W. Wallace Ker, Jersey City, N. J.; Thomas C Frenyear, Gloversville, N. Y.; Percy Howard Powell, Hempstead, N. Y.; Chas. E. Hewitt, Hanover, N. H.; Dwight Parker Robinson, Chicago, Ill.; Carl Harald Hakonson, Schenectady, N. Y.; Daniel Adamson, Hyde, Cheshire, Eng.; Philip Dawson, London, Eng.; Chas. H. Merz, Newcastle-on-Tyne, Eng.; Evan Parry, London, Eng.; Byron T. Burt, Charleston, S. C.; Harrison Wybro, Los Angeles, Cal.; Robert R. Harvey, Wilkes Barre, Pa.; Maurice Coster, Chicago, Ill.; Paul M. Lincoln, Niagara Falls, N. Y.; John F. Skirrow, New York City; Henry G. Stott, Buffalo, N. Y.; Chas. R. Huntley, Buffalo, N. Y.; Geo. H. Blaxter, Pittsburg, Pa.; John B. Cornell, Hamilton, O.; Robert Bruce Mann, Milwaukee, Wis.; Henry S. Carhart, Ann Arbor, Mich.; Will Knox Dunlap, Pittsburg, Pa.; Lewis Degen, Rio de Janeiro, Brazil; Russell B. Harrison, Terre Haute, Ind.; Josiah L. Merrill, Schenectady, N. Y.; Chester P. Wilson, Philadelphia, Pa.; Andrew Pinkerton, Apollo, Pa.; David F. Crawford, Fort Wayne, Ind.; Elmer E. Boyer, Lynn, Mass. James Mitchell, Rio de Janeiro, Brazil.

Personal.

Mr. Robt. T. Lozier has returned from his European trip looking brown and healthy.

Mr. S. A. Douglass, who has been in the West for a few weeks, has returned to the city.

Mr. William A. Doble, of the firm of Abner, Doble & Co., San Francisco, who has been in the city several weeks on business, has returned to the Coast.

Mr. James W. Godfrey, who has been enjoying himself abroad for several weeks, returned with his family on Saturday last.

Mr. George Cutter, of Chicago, was a New York visitor last week.

The firm of Fisher & Porter, Chicago, has been dissolved. Mr. Albert Fisher will hereafter represent Wm. Todd & Co., of Youngstown, Ohio. Mr. H. F. J. Porter will retain the agency of the Bethlehem Iron Company.

Mr. Maurice Hart, accompanied by his brother, Mr. Samuel Hart, has been in the city for several days, and will leave for his home in New Orleans the latter part of this week.

Mr. John J. Moore has retired from his connection with Mr. M. J. Perry's Narragansett station at Providence.

Mr. Brainerd Rorison, formerly of the Fort Wayne Electric Corporation, has accepted a position with the Barber Asphalt Company of Detroit.

Mr. Clarence E. Stump is among the recently returned European travellers.

Mr. Robert Wiggins, of Chicago, spent a few hours in New York last week on his way to Washington.

Fort Wayne Corporation's Recent Sales.

The Fort Wayne Electric Corporation has recently sold to the Narragansett Electric Lighting Company, Providence, R. I., sixteen Wood arc machines, 125 lights capacity each, and six of the same size and type to the Consolidated Company at Toledo, O., both contracts including lamps and accessories.

GENERAL ELECTRIC'S FINANCING POLICY.

Northwest General Electric—The Scheme, the Companies Financed, the Facts and Figures from the Official Record

HOW BONDS ARE MANUFACTURED FOR NEW ENGLAND INVESTORS.

CHAPTER X.

The Mitchell Plant and the Mitchell Electric Company.—II.

A valued correspondent informs us that there is some misapprehension on our part in relation to the exact order of events in the early history of the Mitchell plant. He claims that Mr. Robertson's report to Mr. J. B. Tarbox was made some time prior to the transfer of the electrical machinery from the grist-mill to the station, and that the language quoted by us from Mr. Robertson's report applied to the plant while it was located at the grist mill. We have carefully gone over the mass of notes and records in our possession relating to the history of the plant, and find that our correspondent is right, and we desire to express our regrets for the oversight which caused us to make the mistake. It is our most sincere desire to be strictly accurate in every detail connected with the history of the various transactions we depict, and we particularly wish to be absolutely free from the slightest suspicion of an effort to make matters appear worse than they really were, for we believe that such a course would not only be unwise but is also wholly unnecessary. The misapprehension referred to does not affect the accuracy of the statements made and conclusions so far drawn concerning the manipulation of this plant, except so far as it relates to the comparison of our estimated value of the plant as installed in the station with the values named in Mr. Robertson's report. If our readers will strike out all reference to the comparison of our values with Mr. Robertson's values, the article will be correct.

Such of our readers as are thoroughly familiar with the prices charged for apparatus and supplies at that date, and are also conversant with the costs of installation of electric plants, will no doubt be puzzled to know how the Northwest Company could have invested $12,000 in a plant furnishing only fifteen or sixteen arc lights and having a capacity of only 500 incandescent lights and run from hired power in a hired room, and at that time using no meters. The maximum price obtainable for arc lighting apparatus at that date was about $100 per light erected, and the apparatus itself could be purchased for closely approaching half that sum per light. The entire cost of installing a complete alternating current incandescent system of the magnitude of the one put in at Mitchell should not exceed $10 per lamp, therefore the cost of installing the plant as it existed when operated from the grist-mill should not have been more than $9,000, and ought to have been very much less if the prices actually prevailing for apparatus and supplies at that time had been charged on the books of the Northwest Company. We believe we shall be able to shed some light on the matter of the charges to these plants on the books of the Northwest Company which will fully explain how that company could have expended about $12,000 on a plant of so small capacity as that located in the grist mill at Mitchell.

We will now resume the further discussion of the operations connected with the history of the manipulation of the Mitchell plant.

Mr. Byllesby entered upon his duties in connection with the Northwest Thomson-Houston Company within a comparatively short time after the submission of Mr. Robertson's report to Mr. J. B. Tarbox, the treasurer of the company. The affairs of the company had been in a very bad way for some time past, and Mr. Tarbox took the position of treasurer for the purpose and with the intention of instituting radical reforms in its business management. The company was already greatly embarrassed financially, and one of the most serious difficulties confronting it at that time was that of the many electrical properties long carried on its books as assets but which entailed constant loss and from which nothing could be obtained in the way of substantial returns. The Mitchell plant had been on the books as an asset for over two years, and the evidence of its exact condition was conveniently at hand. Is it conceivable that Mr. Coffin and Mr. Byllesby were ignorant of the existence of that evidence and unacquainted with its exact nature at the time the scheme for the resurrection of all these properties was concocted?

It was during the very early part of Mr. Byllesby's vicarious administration of the affairs of the Northwest Thomson-Houston Electric Company that the plan for building the Mitchell station and transferring the plant from the grist-mill to it was evolved, and the work and expenditures connected with it were under his immediate supervision and control. Is it possible to believe that he undertook this task without an understanding of the exact condition of the plant at that time, and what its past history had been and what its probable future prospects were?

It must be remembered in this connection that Mr. Byllesby was no tyro in the business at the time he entered upon his duties in the Northwest Company. He had been employed for several years with the Edison Company, had been vice-president and general manager of the Westinghouse Company for about four years, and in those positions he certainly had abundant opportunity to fully qualify him to correctly estimate what revenues and what profits could be expected to be derived from electric lighting stations of large or small capacity. Moreover he had before him plenty of evidence in the way of numerous much larger stations than that erected at Mitchell to demonstrate that there was no margin for working the watering scheme in connection with electric lighting stations, and more especially so with the smaller ones. He could not possibly have been ignorant of the fact that in a town of such small size as Mitchell, with such a limited demand for lights and with a plant of such extremely limited capacity, there was little or no hope for any return on even a proper investment, and not the slightest justification for capitalizing a company at one dollar over that actually *necessary* to properly install the plant. He *must* have known that even under the conditions of the most rigid economy in first cost and subsequent running, it was well nigh impossible to earn enough to pay the operating expenses of such a station.

But Mr. Byllesby had spent considerable time in Boston before assuming the vicarious position in the Northwest Company, and he knew that the relations of the Northwest Company to the Thomson-Houston Electric Company were such that what one lost the other also lost, and the problem to be solved was: How was the Northwest Thomson-Houston Company to save itself and the parent Thomson-Houston Electric Company from the loss of money represented by the machinery, apparatus and supplies furnished and that expended in erecting the plant and meeting the constant loss incurred in its operation and maintenance? Why, of course, by making arrangements for the purpose of endeavoring to transfer these burdens to the pockets of others by means of the now well-known stock-and-bond scheme. For had not Mr. Coffin and some of his associates organized special companies for marketing stocks and bonds, and had not the Thomson-Houston Electric Company been admittedly quite successful in disposing of large amounts of such so-called securities to investors?

With the elaborate and extensive machinery provided by Mr. Coffin for the express purpose of floating so called electric securities, there was no reason, according to their code of business morals, why they should hesitate to arrange to put it into operation and seek to avail themselves of its advantages in relieving themselves of the burden of the loss incurred in connection with the Mitchell plant.

Accordingly articles of incorporation were drawn up for the formation of the "Mitchell Electric Company" under the laws of the State of Minnesota, and the certificate of its incorporation was filed with Minnesota's Secretary of State on the 1st day of February, 1892

A copy of this certificate is printed herewith. It will be noticed that the authorized

[COPY.]

ARTICLES OF INCORPORATION OF THE MITCHELL ELECTRIC COMPANY.

We, the undersigned, for the purpose of organizing and becoming a body corporate under and by virtue of the laws of the State of Minnesota in such case made and provided, have adopted and executed the following articles of incorporation:

Article First.

I. The name of this corporation shall be "Mitchell Electric Company."

II. The general nature of its business shall be:

(a) To construct, maintain and operate a plant or plants for manufacturing and generating electricity.

(b) To deal in, furnish and supply electricity for light, heat and power.

(c) To carry on any and all business in anywise appertaining to or connected with the manufacturing and generating, distributing and furnishing of electricity for light, heat and power purposes, including the transacting of any and all business in which electricity is now or hereafter may be utilized, and all matters incidental or necessary to the distribution of electric light, heat and power.

(d) To manufacture and repair any and all necessary appliances used in or which may be required or deemed advisable for or in connection with the utilization of electricity or in anywise appertaining thereto or connected therewith.

(e) To lease, purchase, hold, sell, convey, mortgage and exchange real ~~and~~ or personal property ~~and~~ or contracts, and to do any and all other things, and carry on any and all other business operations which may be necessary ~~and~~ or advisable in connection with the manufacturing, generating, distributing, selling and furnishing of electricity or the apparatus and appliances connected therewith.

III. The principal office of the company hereby incorporated shall be in the city of St. Paul, Minnesota, and the location of its principal electric plant shall be in or near the city of Mitchell, State of South Dakota.

Article Second.

The time of the commencement of this corporation shall be the first day of February, A. D. one thousand eight hundred and ninety-two (1892), and the period of continuance of said corporation shall be thirty (3) years from said date.

Article Third.

The amount of the capital stock of this corporation shall be fifteen thousand dollars ($15,000) and the same shall be paid in at such times and in such manner as the Board of Directors of this corporation may designate.

Article Fourth.

The highest amount of indebtedness or liability to which this corporation shall at any time be subject shall be the the sum of twenty thousand dollars ($20,000).

ARTICLE FIFTH.

The names and places of residence of the persons forming this association for incorporation are as follows:

Henry M. Byllesby,	St. Paul,	Minnesota.
Howard C. Levis,	"	"
Wm. Ely Bramhall,	"	"
Benj. F. Meek, Jr.,	"	"
Wentworth P. Johnson,	"	"
Charles K. Stearns,	"	"
S. P. Wells, Jr.,	"	"

ARTICLE SIXTH.

I. The government of this corporation and the management of its affairs shall be vested in a board of seven directors, each of whom shall be a stockholder, and in the following offices, viz., a president, vice-president, secretary and treasurer, and such other offices and agents as the Board of Directors may from time to time appoint.

II. The directors shall be elected at the annual meeting of the corporation on the first Monday in March in each year.

III. The officers of this corporation shall be elected annually by the Board of Directors at their first meeting each year immediately after the annual meeting of the stockholders.

IV. The president, vice-president, secretary and treasurer shall each be directors and their term of office and the term of office of directors shall be one year and until their successors are duly elected and qualified.

V. The names of the first Board of Directors of this corporation are:

Henry M. Byllesby,
Howard C. Levis,
Wm. Ely Bramhall,
Benjamin F. Meek, Jr.,
Wentworth P. Johnson,
Charles K. Stearns,
S. P. Wells, Jr.,

and they shall hold office until the first annual meeting in March, 1893.

ARTICLE SEVENTH

The capital stock of this company shall be divided into one hundred and fifty shares of the par value of one hundred dollars each.

In witness whereof we have hereto set our hands and seals this first day of February, A. D. 1892.

H. M. BYLLESBY. [Seal]
HOWARD C. LEVIS. [Seal]
WM. ELY BRAMHALL. [Seal]
B. F. MEEK, JR. [Seal]
W. P. JOHNSON. [Seal]
C. K. STEARNS. [Seal]
S. P. WELLS, JR. [Seal]

Signed and sealed in presence of
WALTER RUAN.
R. V. PRATT.

State of Minnesota, County of Ramsey, ss.

On this first day of February, A. D. 1892, before me personally appeared Henry M. Byllesby, Howard C. Levis, Wm. Ely Bramhall, Benjamin F. Meek, Jr., Wentworth P. Johnson, S. P. Wells, Jr., and Chas. K. Stearns, to me well known to be the same persons who executed the foregoing instrument, and each for himself acknowledged that he executed the same as his free act and deed for the uses and purposes therein expressed.

ROSWELL V. PRATT,
[Notarial Seal] Notary Public, Ramsey Co., Minn.

State of Minnesota, County of Ramsey, ss.
Office of the Register of Deeds.

This is to certify that the within instrument was filed for record in this office at St. Paul on the 3d day of February, A. D. 1892, at 9:40 o'clock A. M., and that the same was duly recorded in book G of incorporations, pages 63-70.

CHAS. L. HAAS,
Register of Deeds.

Filed for record in this office February 11, 1892, at 9:30 o'clock A. M.

F. P. BROWN,
Secretary of State.

OFFICIAL CERTIFICATE OF TRANSCRIPT.

UNITED STATES OF AMERICA,
STATE OF MINNESOTA,
DEPARTMENT [Seal] OF STATE.

I, Albert Berg, Secretary of State of the State of Minnesota, do hereby certify that I have compared the annexed copy with record of the original instrument in my office of articles of incorporation of the Mitchell Electric Company, as filed Feby. 11, 1892, and recorded in book "D. 2" of incorporations, page 340, etc., and that said copy is a true and correct transcript of said record of said original instrument and of the whole thereof.

Great Seal
of the
State of
Minnesota.
1858.

In testimony whereof I have hereunto set my hand and affixed the great seal of the State, at the Capitol, in Saint Paul, this 28th day of August, A. D. eighteen hundred and ninety-five.

ALBERT BERG,
Secretary of State.

---

capital stock is $15,000 and the authorized indebtedness $20,000, making the total legally permissible capital of the company $35,000.

In another part of this week's paper we publish a full list of the employees of the Northwest Thomson-Houston Electric Company, and by a comparison of the names of the incorporators of the Mitchell Electric Company with those in the list referred to it will be seen that they were, with one exception, all regular employees of the Northwest Thomson-Houston Electric Company. The one exception is that of Mr. William Ely Bramhall, who was a lawyer in St. Paul. Each in his own way carried out the orders issued by C. A. Coffin, manager of the parent T.-H. Company at Boston. Their positions were as follows:

Henry M. Byllesby, President of Northwest T.-H. Co.

Howard C. Levis, Vice-President and Treasurer of Northwest T.-H. Co.

Wm. Ely Bramhall, Attorney Northwest T.-H. Co., and Private Attorney for H. M. Byllesby.

Benjamin F. Meek, Jr., Secretary and Assistant Treasurer Northwest T.-H. Co.

Wentworth P. Johnson, Auditor Northwest T.-H. Co.

Charles K. Stearns, Chief Engineer Northwest T.-H. Co.

S. P. Wells, Jr., Supt. Sales Dept. Northwest T.-H. Co.

Walter Ruan, Cashier Northwest T.-H. Co.

R. V. Pratt, Bookkeeper Local Properties, Northwest T.-H. Co.

We thus prove the correctness of our statements concerning the method pursued in forming companies on the local properties which we described in the introductory chapter to this series of articles.

Our readers will note that the original Mitchell plant was started in the early part of 1889, and Mr. Robertson's report was submitted about one year after the plant had been in operation. Notwithstanding his report, the operation of the plant was continued until Mr. Byllesby's inauguration, which occurred about a year after. At the time the resurrection scheme was formulated and put into operation the plant had therefore been running a little over two years. No plea can be successfully urged or maintained that these exploiters did not have before them at the time of the organization of the Mitchell Electric Company sufficient information to judge of the worthless character of the property as an investment, and the hopelessness of any such increased demand for lights as would warrant the continuance of the service. Indeed, any moderately well informed electrical engineer could have predicted with absolute certainty that there was not the slightest chance of commercial success for the undertaking, and that the new plant was practically just as worthless as an investment as the original one.

We have in our possession the official statement of the earnings and expenses of this "Mitchell Electric Company plant," a copy of which is here presented:

[COPY.]

MITCHELL ELECTRIC COMPANY.

STATEMENT OF EARNINGS AND EXPENSES FOR TWELVE MONTHS ENDING FEBRUARY 28, 1893.

Earnings.

	Arc.	Inc't.	
March	$188.90	$251.09	
April	188.90	228.53	
May	188.90	307.23	
June	155.11	291.52	
July	200.61	231.00	
August	153.87	208.21	
September	155.70	238.41	
October	57.05*	265.10*	
November	....*	....*	
December	159.00	473.17	
January	147.00	380.52	
February	141.00	338.39	
	$1,586.01	$3,213.17	$4,799.21
Wiring			87.23
Total earnings			$4,886.44

* NOTE—The plant was shut down during a part of October and the whole of November.

Total earnings brought forward		$4,886.44
Expenses.		
Lamps	$365.77	
General expenses	241.18	
Fuel	1,909.07	
Oil and waste	42.24	
Boiler compound	34.23	
Carbons	25.96	
Water rent	10.00	
Repairs to electric plant	222.70	
Repairs to steam plant	302.19	
Salaries of engineer and fireman	1,149.00	
Rent	5.00	
Taxes	250.66	
Insurance	271.78	
Discount	7.57	
		$4,863.37
Surplus for twelve months		$23.07
Interest.		
Interest on notes		$687.40

By this official statement it will be seen that, aside from interest on notes, the net earnings for the period covered was only $23.07. The interest on the floating indebtedness amounts to $687.40, leaving a deficiency of $664.33. But there is omitted from the statement the accrued interest on the $15,000 6 per cent. bonds, amounting to $900; this increases the deficiency to $1,564.33.

In our next issue we shall consider this statement more in detail, and shall present the results of a careful analysis of it and also of other accounts of the company.

(To be continued.)

LIST OF EMPLOYEES NORTHWEST G. E. COMPANY, AUGUST 1, 1892.

General:
- H. M. Byllesby, President.
- Howard C. Levis, Vice-President and Treasurer.
- George C. Duffie, Assistant Secretary.
- W. H. Moore, Manager Local Properties.
- R. V. Pratt, Bookkeeper Local Properties.
- Alice A. Barry, Stenographer.
- Frank Slater, Watchman.
- M. Horrigan, Janitor.
- Bert Warner, Office Boy.
- V. Toof, Office Boy.
- John McKnight, Office Boy.

Engineering and Expert Department:
- Chas. K. Stearns, Chief Engineer.
- Oscar Claussen, Civil Engineer.
- H. T. Purdy, Railway Engineer.
- F. D. Sampson, Railway Engineer.
- M. H. Gerry, Draughtsman.
- J. S. Bassett, Railway Engineer.
- F. M. Farwell, Railway Engineer.

Repair Department:
- J. M. Denniston, in charge.
- W. J. Bonwell, Superintendent.
- Jerry Horrigan, Engineer.

Accounting Department:
- B. F. Meek, Jr., Secretary and Assistant Treasurer.
- W. P. Johnson, Auditor.
- Walter Ruan, Cashier.
- Geo. C. McKnight, Bookkeeper.
- E. A. Patrick, Assistant Bookkeeper.
- Gerda Lund, Assistant Bookkeeper.
- Geo. W. Haskell, Stock Clerk.
- Wm. Blackburn, Stock Clerk.
- Chas. W. Hayes, Bill and Order Clerk.
- H. B. Warren, Statistics.
- A. J. Gifford, Freight and Invoice Clerk.
- W. L. Moulder, General Clerk.
- Fleming Meek, Copying and File Clerk.
- E. M. Warner, Stenographer.
- L. A. Healy, Stenographer.

Sales Department:
- S. P. Wells, Jr., Superintendent.
- F. N. Armour, Salesman.
- John H. Finney, Salesman.
- J. K. Metzger, Salesman.
- A. S. Huey, Salesman.
- I. C. Woodward, Salesman.
- W. F. Smith, Superintendent Construction.
- W. M. Deming, Meter Salesman.
- J. F. Bishop, Stenographer.
- Julia Gorgas, Stenographer.
- E. Sprague, Stenographer.
- C. W. Farnham, Salesman.

Supply Department:
- R. H. Beach, Purchasing Agent.
- S. B. Howarth, Salesman.
- H. J. Gile, Requisition Clerk.
- P. N. Nelson, Stock Clerk.
- C. M. Miller, Stock Clerk.
- Chas. Hirzel, Stock Clerk.
- A. W. Zahm, Salesman.
- C. B. Tarbell, Shipping Clerk.
- Chas. Jones, Packer.
- P. N. Hilgard, Packer.
- E. P. Wagner, Packer.
- Harry Ellems, Elevator Boy.
- M. Gibbons, Teamster and Team.
- C. B. Barteau, Stenographer.
- A. Lang, Stenographer.

An electrical novelty has been placed on the German imperial yacht Hohenzollern in the shape of a standard intended for night use. The flag is four meters square, and the design is traced in colored electric lamps.

UNIPOLAR INDUCTION.[*]

BY REGIERUNGSRATH DR. C. L. WEBER.

An article by Prof. Arnold on alternating-current machines with stationary winding[†] is prefaced by some remarks on unipolar induction. The latter subject has also recently been elaborately treated by Prof. Lecher, of Innsbrück.[‡]

While Lecher, on the basis of experiments extending over many years, claims to have come to a definite conclusion as to the explanation of the phenomenon in question, Arnold admits that the majority of the appearances can be explained by the specific reciprocal results, but finally declares for those which Lecher does not deem to be trustworthy. For this reason a short consideration of the subject may be justifiable, for it must be puzzling to anyone who is not perfectly acquainted with the details of the question when, regarding a matter which crops up daily in practical work, two views of so fundamentally opposite a character are maintained.

The question is as follows: A cylindrical magnet revolves on its geometrically coincident magnetic axis. Will the lines of force of the magnet rotate with it, or does the magnetic field stand still? The above mentioned article by Lecher is without doubt the most careful and most elaborate investigation of the subject of unipolar induction which has been published in the last 10 years. As they cannot again be recorded here, it may be mentioned that Lecher repeated nearly all the experiments hitherto made bearing upon the question and critically examined them, finding thereby that in the case of all previous investigations the observations could be explained by both the one and the other theory.

Finally, the following experiments, which are to be considered as conclusive, were devised and carried out by him. A magnet excited by a fixed coil is divided into two parts, I and II (Fig. 1), which can individually be rotated on the axes, S N, S' N'. Corresponding axle shafts are arranged at N S, N' S'. At the same points, and also at *b* and *d*, are the sliding contacts, *a*, *b*, *c*, *d*, *e*, which can be connected with a galvanometer, G. The direction of the lines of force has to be conceived in the manner indicated. As is known, there flows, if both parts rotate together along a path, *a* G *b* or *a* G *c*, a current which, in the acceptation of a revolving field, can be imagined as having originated in the fixed galvanometer leads; in the supposition of a fixed field, in the rotating mantel surfaces and in the radial parts of the iron core. The following outcome of an experiment can also possibly be explained by both views. Only magnet II revolves, the galvanometer being first at *c d*, next at *d e*. The issue in both cases is the same. It can here be taken with Faraday that in both instances the same amount of induction takes place in the actual conducting parts of the magnet on the fixed field being cut, as, according to the other view, that the total of the E. M. F. induced in the two fixed circuits in both cases is the same.

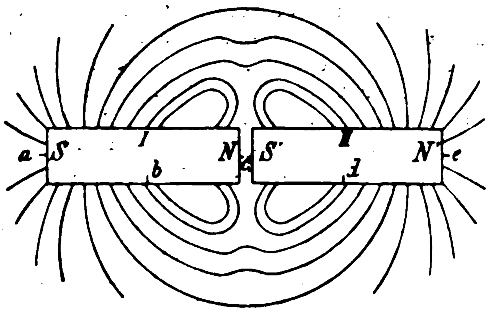

FIG. 1.

The course of the lines of force certainly causes the latter explanation to be considered with doubt, but the determination of this course is generally of an uncertain nature.

On the other hand, the observations about to be described cannot be brought into consonance with the theory of rotating lines of force. If Lecher altered the last mentioned experiment, so that not only magnet II, but also magnet I revolved, either in the same direction as, or in the reverse direction to, II, the galvanometric results were the same as if I were stationary. According to Faraday, this is immediately clear, since the magnetic field remains continually at rest and the actuated conductors connected with the galvanometer only belong to magnet II. The contrary happens if the lines of force revolve with the magnet; for then, if I be set in motion, an influence of the galvanometer circuit, *c* G *d*, is perceptible, as the lines of force emanating from and actuated with I reach into the circuit *c* G *d*.

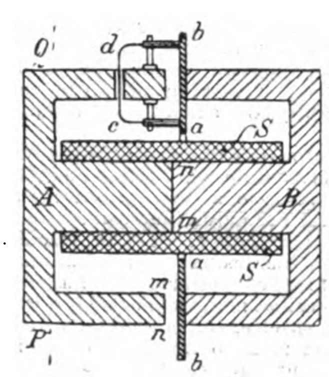

FIG. 2.

Clearer is the following experiment: If *b c* is at the galvanometer, and I rotates while II is stationary, exactly the same current is obtained if *b d* is at the galvanometer and I again rotates, II being stationary. If, however, both magnets are revolved in opposite directions, double the amount of current is the result.

Finally, Lecher connected the sliding contacts *a* and *e* with the galvanometer, so that the wires formed the extension of the magnetic axis. If now, I rotates alone, a current of 33 is obtained; if II rotates alone, and in the contrary direction, the same result is attained; if both magnets are simultaneously revolved in the opposite direction the total of the two previous currents is the result.

Arnold has a new but impossible theory. He says: "It must be considered, if only the one magnet revolves, that then its lines of force rotate at only half-speed, and that generally the speed of the angle of the magnetic field does not correspond with that of the revolving iron mass, but that the rate of both is dependent upon the ratio of the actuated to the total iron mass."

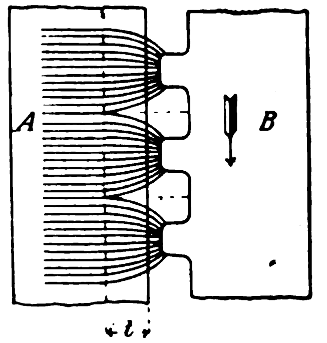

FIG. 3.

If it be sought to follow this idea it will be necessary, in the first place, to at least look upon the lines of force flowing within the iron as bound to the iron and revolving at the same speed. Then, however, a variation of speed must occur at the point of exit, and therefore a tearing off of each line of force and a sliding away of its termination at the magnet surface. Likewise must then at the place of entry in the stationary or opposite rotating part of the magnet a similar inconstant point in the lines of force with the half angle speed glide over the surface of the iron. The lines of force in the various parts of the course must exhibit a triple phase: (1) within the iron they have the same speed as this; (2) outside of it they show the half, or generally another speed; (3) at the points of transition a sudden change in the speed occurs.

The idea of a stationary field with rotating iron core has nothing overstrained in it. The lines of force are comparable to a condition of the ether, which is influenced by the properties of the surrounding matter. If, however, neither the magnetic excitation nor the exciting capacity of the material alters in a given direction from point to point, so will also the condition of the ether remain unchanged. A ground for a rotation of the field of force does not therefore exist with the rotation of a magnetic body whose geometric, magnetic, and rotation axes coincide.

If we take two bell-shaped iron cores which are excited by a common coil and can rotate independently of each other, something as in alternating-current machines, we find that between the two outer mantel surfaces gaps remain which can take up induced coils (Fig. 2). So long as the dividing surfaces run continuously throughout, the above considerations find application without further difficulty, and lead to the representation of a fixed magnetic field, by which, in simultaneously rotating parts of conductors (as, for example, in the disk *a b*), radial currents are induced; but if the dividing surfaces—in the first place on one side only—are not continuous (Fig. 3), the idea of the simultaneously rotating lines of force, shown as incorrect, again obtrudes itself. A little consideration, however, manifests that this theory is here quite unnecessary and liable to lead to error. This is best recognized by passing over to the next drawing, Fig. 4, where both surfaces are furnished with teeth. A is rotating and B is stationary; you fix an individual tooth in your eye and conceive that it on the rotation of position 1 pushes forward into position 2.

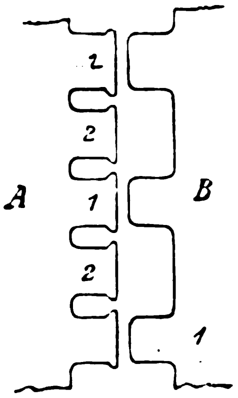

FIG. 4.

If here the lines of force rotate with the iron mass equally as many lines of force should pass through this one tooth in position 1 as if it after a short time had reached 2. This will in reality in nowise be the case; we are rather shown that the tooth in question in position 2, on account of the large air-gap, carries considerably fewer lines of force. The induction consequently which a coil placed on the tooth experiences proceeds here not from a rotation of the lines of force in the direction of the field, but from a fluctuation of the flow of force parallel to the rotating axis. The majority of the lines of force produced will now take their way through the one tooth, now through the other, accordingly as the one or the other path offers at the moment the least amount of resistance. The theory that here the lines of force should rotate at half-speed is obviously upon this hypothesis not feasible.

---

[*] "Elektrotechnische Zeitschrift," August 15, 1895.

[†] "Elektrotechnische Zeitschrift," March 7, 1895.

[‡] "Sitzungsberichte" der kaiserlichen Akademie der Wissenschaften zu Wien (Abtheilung II., Band 103, Heft 8, S. 949-980).

For the estimation of the eddy currents set up, and of the magnetization energy, and for the selection and arrangement of the means to be used for the avoidance of these losses, it is a point of great importance whether in machines of the last-named form a side by-pass of the lines of force or a deviation in the direction of the rotating axis is presupposed. If you, in the last-mentioned case, look upon the actuated part somewhat as the field magnet of an alternating-current machine, the fluctuations mentioned will pass for armature reaction.

COMMUNICATION.

THE BERLINER PATENTS.

To the Editor of ELECTRICITY.

Referring to your recent editorial under the caption of "The French Berliner Patents," I would like to ask—1st. Upon what ground is the foundation for saying that the Berliner patent is a generic patent? 2d. What effect does Berliner's disclaimer in the following words, "Neither do I claim that I am the first who caused such electrical undulations by varying the resistance of an electrical circuit in which a current was passing," have upon the extent of his claims? 3d. If Berliner was not the first inventor to produce electrical undulations similar in form to sound waves by varying the resistance of the circuit, who was? 4th. What kind of a microphone does Bell's fourth claim of his 1876 patent refer to? 5th. Why is not Bell's microphone as claimed in his March 7, 1876, patent ever mentioned by the papers? 6th. To what does Bell refer in the following: "I have heretofore described and exhibited such other means of transmitting sound, as will be seen by reference to the proceedings of the American Academy of Arts and Sciences, Volume XII"?

A. B. STROWGER.

Chicago, Ill., Sept. 2, 1895

Answering the above questions *seriatim*, we would say—

1. That the Berliner patent is from the broadest view only a sub-genus patent—an offshoot from the original Bell patent, which covered the art of transmitting articulate speech by means of undulatory currents. In the fundamental patent *any* means of producing electrical undulations corresponding to sound waves was covered. The Berliner patent, covering one general method of producing these electrical undulations, was of course subordinate to this fundamental patent. Had any one patented a method of producing these undulations by the broad claim of *varying the resistance* of an electrical circuit so that this resistance should vary in a manner to produce electrical undulations similar in form to sound waves, that patent would be a species patent as related to the Bell patent and a genus patent as related to the Berliner. The latter, however, limits himself to a particular method of varying this resistance, viz., by causing the sound waves to *vary the pressure* between *electrodes in constant contact.* So far as we know, the patent of 1891, filed June 4, 1877, was the first to describe this particular method of varying the resistance. Evidently there may be a thousand specific ways of doing this, and to all of these the Berliner method stands in the relation of genus to species. It will thus be seen that the terms *genus* and *species* have no absolute meaning, but merely a relative one and that it is in this sense that we use the term.

2. Berliner's disclaimer, "Neither do I claim that I am the first who caused such electrical undulations by varying the resistance of an electric circuit in which a current was passing," is an acknowledgment by him that a genus method of which his was relatively but a species had existed before his invention. It is a disavowal on his part that he claimed the *broader* method of varying the resistance. He evidently knew that he could not patent this broader method, and in order that there might be no question as to his claims, he disavowed that which he did not claim. It is our idea that the Berliner method covered by patent No. 463 569 bears very much the same relation to that which is disclaimed as the latter bears to the original Bell method or as the carbon transmitter bears to the Berliner.

3. Berliner by his disclaimer admits that he was *not* the first one to produce electrical undulations similar in form to sound waves *by varying the resistance* of the circuit. We are under the impression that a number of others produced these undulations by varying the resistance before Berliner did, and among these were Bell himself and Prof. Elisha Gray, who used liquids in which the variation of resistance was caused by a varying depth of immersion of one of the electrodes or by varying the distance between two electrodes connected by a poor conductor of electricity.

4. Bell's fourth claim in the patent of March 7, 1876, reads as follows: "The method of producing undulations in a continuous voltaic circuit by gradually increasing and diminishing the resistance of the circuit, or by gradually increasing and diminishing the power of the battery." This very distinctly describes a genus method to which Berliner's is a species, and is evidently exactly what Berliner referred to in his disclaimer. If our correspondent had read the patent carefully he would have seen that Bell did not contemplate the specific method patented by Berliner, but intended to cover *all* methods of producing undulatory currents by varying the resistance of the circuit. In his descriptive remarks he mentions the dipping of the electrodes in mercury.

5. We cannot speak for the other papers, but speaking for ourselves would say, that we have never mentioned this form of transmitter in connection with the Berliner litigation because we never dreamed that it had the remotest bearing upon the validity of Berliner's patent.

6. Bell's references are too numerous for mention here, but we find none that we think could be used to invalidate the Berliner patent. To most of these references the Berliner bears the relation of species or sub-genus to genus, and therefore so long as the original genus patents were in force the Berliner patent was subordinate to them.

London Notes.

(From our London Correspondent.)

ACCUMULATOR TRACTION.

It is pretty certain that another line of electric tramways propelled by accumulator power will not be constructed in England for many a day. The extravagance of such a system is exemplified by a section of the Birmingham Central Tramways which has been running with most unsatisfactory results for some years. The company has divided its system into four departments, viz., horse, steam, cable and electric. The steam and cable departments are stated to be progressive and very profitable but the other two are a continued source of anxiety and difficulty to the management.

Over the electric section during the past year fewer passengers were carried than formerly, fewer miles were covered, and consequently the receipts were decreased. This accumulator line has resulted in a loss during the period of £1,735 odd. The directors blame the batteries, but given a perfectly satisfactory accumulator which will be very economical (if such were procurable), it would take a long time to remove the effects of past erratic management. However, in any case, an extensive system of accumulator traction on tramways is a thing of the past or the future, not of the present. The following figures of the costs on the Birmingham line go to prove that:

Steam	Traction	per	working	mile,	9.11d.
Horse	"	"	"	"	8.67d.
Cable	"	"	"	"	5.43d.
Electric	"	"	"	"	18.43d.

A MOUNTAIN ELECTRIC RAILROAD ON THE ISLE OF MAN.

The Isle of Man possesses some of the most beautiful if not the best specimens of British scenery. Its exquisite views are a thrilling attraction to tourists and visitors from all parts. The inhabitants, as might naturally be expected, have ever been alive to the necessity of making their various towns as attractive as possible to holiday makers, and perhaps their anxiety in this direction is primarily responsible for the erection of an electric tramway there last year from Douglas to Laxey, the length being about seven miles.

The promoters of that line and the inhabitants of the districts through which the tramway runs have every reason to be satisfied with the success of their undertaking; this success was evident in the early stages, for hardly had the cars commenced running when an extension for several miles was proposed.

That proposal was that the line be taken from Laxey a further distance of about 4¾ miles, terminating at the summit of the mountain Snaefell. The extension, which was taken up very enthusiastically by everyone interested, is now an accomplished fact, and the line was finally inspected by the Board of Trade officials who made a trial run on August 16th. Public traffic commenced on August 2 st.

The erection of the railway involved a great deal of heavy engineering work, which has been very costly, for the line at certain stages has had to be cut through the rocks and at others passed over high banks supported by massive retaining walls. The ground is rocky and precipitous. An item of interest is that after a distance of 3 miles from Laxey has been covered, the line begins to wind round and makes a complete circuit of the mountain (in 1¾ miles) and terminates.

The whole plant for working the line has been manufactured by Messrs. Mather & Platt, Limited, of Manchester. It includes four Lancashire boilers 26 ft. long by 6 ft. 6 in. diameter, capable of giving 700 H. P.; five horizontal compound engines of over 100 H. P. each, driving Mather & Platt dynamos, each of the latter supplying current at 500 volts. The dynamos have "Edison-Hopkinson" magnets and "Manchester" armatures. The power station where this plant is situated is about 2¾ miles from the Laxey terminus. The plant is of sufficient capacity to propel at least three fully loaded cars at the same time upon the ascending line at 8½ miles per hour.

The accumulator station is at the Laxey end of the line and is equipped with an installation of 240 chloride cells of the following capacities: 140 amperes for three hours, 80 amperes for six hours, 63 amperes for 9 hours, or 56 amperes for 12 hours. The accumulators absorb the spare current generated by the dynamos and distribute it to the line as the load requires. Messrs. Mather & Platt first introduced this method on the Douglas and Laxey section, where it proved a great success, contributing very materially to the economical and regular working of the line. The same firm has also adopted the same system on the Stockholm and Djarsholm electric railway.

The passenger cars, which are 35 feet in length and will seat 48 passengers, are each carried on two four-wheeled bogies. Each axle is driven by a Mather & Platt No. 5a "Manchester" motor. Every possible precaution has been taken to prevent the cars leaving the rails. It would be quite impossible for the flanges of the carrying wheels to mount the bearing rail whilst the guide wheels are in play. A powerful center rail brake is fitted to each car, the action of which is to grip the center rail itself, while each wheel has the ordinary brake fitted. The cars can be stopped within a few seconds. Each driver's cabin is provided with emergency switches and ammeters, with suitable resistances for regulating speed, etc.

General News.

What is Going on in the Electrical World.

San Leandro, Cal.—The town trustees are considering plans for an electric light and power plant to be owned by the town.

Richmond, Va—The ordinance granting the Broad street franchise to the Richmond Traction Company has been signed by Mayor Taylor.

Selma, Ala.—There seems to be a probability of the Chicago Incandescent Light Company removing its plant from Chicago to this city.

Parkersburg, W. Va.—The electric light plant on Avery street was damaged by fire on the night of the 28th ult. to the extent of $8,000.

Greenville, Ala.—A Greenville man has offered to donate the ground for a building for an electric light plant, and to furnish the fuel free of charge.

Springfield, Mass.—A company is being formed here for the purpose of manufacturing the Duryea motor wagon. The board of trade is backing the movement.

Williamsport, Pa.—The Beacon Electric Company has notified the city controller that its contract with this city for lighting has been assigned to the Lycoming Electric Company.

Ann Arbor, Mich.—The city council has accepted the bid of the Michigan Electric Company of Detroit for lighting this city during the five years beginning January 1st next.

Bordentown, N. J.—An ordinance authorizing the Bordentown Electric Light and Motor Company to construct and operate works has passed its first reading in the city council.

Clarksville, Tenn.—Books have been opened for subscriptions to the stock of the company to build an electric railway system in this city. The cost of the plant proper has been placed at $40,000.

Shelburne Falls, Mass.—A canvass is being made here to ascertain how much support citizens would give if a local company were formed to furnish electric lights for public and private use.

Buffalo, N. Y.—The Niagara Falls Power Company has refused to accept the franchise granted by the council of Buffalo, because of objectionable clauses relating to poles, conduits, taxes, length of grant, etc.

Troy, N. Y.—The Sandlake electric road is expected to be ready for the running of cars in a few days. The generators for the power house have been shipped from the Westinghouse works at East Pittsburg, Pa.

Washington, D. C—The final survey for the line of the new electric railway between Washington and Laurel has been made through Riverdale, and the contract for grading the road will be soon given out.

Newark, N. J.—The Livgro Incandescent Lamp Company has sold out its entire plant at Harrison to the United Electric Company of Philadelphia. The company had only a few hands employed.

Detroit, Mich.—The Citizens' Company has made application for a permit to remodel the Brush and Russell street car line into an electric line. The permit will be issued as soon as the material is on the ground.

Orchard Lake, Mich.—Col. J. Sumner Rogers, of Michigan Military Academy, Orange Lake, and others have secured the necessary franchises and right of way for an electric railway connecting Orchard Lake with lines in Detroit.

Albany, N. Y.—There is considerable agitation in Albany over the lighting contract prepared for the council's action, and decided opposition to the clause making it obligatory on the contractors to use the "Brush" system.

Charlottetown, P. E. I.—The Royal Electric Company of Montreal have contracted with the city council to supply Charlottetown with 65 arc lights of 1200 candle-power each for $73 per lamp per annum. The company also agree to allow the corporation 50 cents per night when the lights are out.

Owego, N. Y.—At a meeting held here recently to consider the project of building an electric road from this city to Speedsville, a committee was appointed to confer with some New York capitalists who are willing to invest in the scheme. Geo. F. Andrews is chairman of the committee.

Northport, L. I.—During the seven months in which the electric light plant has been in operation in Northport 3,000 lamps have been succeeded by electric lights. Before the company is one year old one of the present 500-light dynamos will be taken out and a 1,000 light dynamo put in its place.

Beverly, Mass.—It is said that the Lynn and Boston company who purchased the Beverly and Danvers street railway some time ago will equip it with the trolley system at once. The road has not been in operation for several years, having been run by the storage battery system, which was afterward abandoned.

Summit, N. J.—The Mountain Electric Light Company, which was incorporated two weeks ago by Carrol Ph. Bassett, Adolph Wagner and Frederick E. Green, with a capital of $100,000, has filed a bond of $5,000 with the township committee for the performance of the contract for lighting the streets of Summit.

New York.—The Metropolitan Traction Company, according to the latest reports, have decided to do away with horses on all their lines and install electricity in their stead. The company intend also to establish popular amusement resorts in the vicinity of the city which can be reached speedily by the electric cars.

Anderson, Ind.—A $500,000 blaze took place in this city a few days ago. It was not much of a blaze, being simply the burning of the bonds of the Marion Street Railway Company which have been redeemed. The company will be reorganized and will take the present plant out and put in a double track and improved electric service.

Palouse, Wash.—Local business men are making arrangements to put in a 600-lamp electric light plant, to be operated by water power. They have secured an option on the dynamos of the old plant and are now completing negotiations for the power. The plant will be located in the Palouse roller mill and operated by the surplus power of this mill.

Cleveland, O.—South Brooklyn citizens have presented a petition to the county commissioners requesting them to grant a franchise to the Wadsworth Electric Railway Company. The route mentioned is from South Brooklyn to Royalton, a distance of thirty-five miles. The proposed line will connect with the South Brooklyn end of the Big Consolidated.

Meridian, Miss.—The mayor and board of aldermen have accepted the proposition of Col. F. B. Merrill, representative of a New York corporation, to construct an electric light plant and light the streets of the city and maintain an electric street railway. An ordinance embodying the requirements of the city in reference to the franchise will be drawn up.

San Francisco, Cal.—James B. Stetson, of this city, has gone to the East to investigate the working of a recent invention—said to be an electric locomotive—that has not had practical work as yet. If he is satisfied of its superiority, electric locomotives may ere long be seen in operation on the Sansalito and San Rafael branch of the North Pacific Coast Railway.

Pittsburg, Pa.—The *Times* states that an agreement has been signed by the directors of the Birmingham Traction Company and the Knoxville, Fairhaven and Mt. Lebanon Railway Company, by which the latter company will construct, at a cost of $150,000, a double track electric road from Knoxville to Castle Shannon, a distance of five miles, and the Birmingham company will operate it.

Kansas City, Kan.—The appraisers appointed to place a value upon the property of the Argentine Electric Light and Water Company have made their report, fixing the value at $60,000. E. A. Wagener, the master in chancery in whose hands the property now rests, will sell it to the highest bidder at the court house in this city on October 3. The sale is under a first mortgage for $160 000 held by the Farmers' Loan and Trust Company of New York.

Nevada, Mo.—Col. Dudley having secured the franchise for lighting, etc., in Nevada, has organized his company and applied for a charter. The name of the company is the Nevada Electric Railway, Light and Power Company, and the incorporators are: George Dudley, Judge Mills, Judge Selden Spencer, F. T. Allison, Dr. T. F. Prewitt, all of St. Louis, besides several Missouri Pacific and Missouri, Kansas and Texas officials, also C. F. Strohm and Col. Moore, of Nevada.

Brooklyn, N. Y.—The contract for lighting the Ocean Parkway has been awarded to the Flatbush Electric Light Company at 28 cents per lamp per night. Ninety arc lamps will be required.—The Brooklyn Electrical Society held its third annual election on the evening of the 3d inst. The newly elected officers are: President, William Clinton Burling; vice president, R. M. Dickinson; corresponding secretary, Arthur A. Fisk; recording secretary, J. H. Russell; treasurer, Thomas A. Bamford; members of the board of governors: M. R. Rodrigues and W. H. Kirwin.

Philadelphia, Pa.—The charter of the Union Traction Company has been revised so as to substitute $100,000 for $30,000,000. The attorneys for the company made application over a month ago for the charter at a capital of $30,000,000, but Attorney General McCormick was of the opinion that the charter should be granted with a lower capital and afterward increased, as the law states that corporations "may increase their capital to $30,000,000." In order to come within this technical interpretation of the law the attorneys for the company agreed to make the change. The Union Traction Company is the new corporation formed from the combination of the Philadelphia, People's and Electric Traction companies.

The Tesla Patents.

The Westinghouse Electric and Manufacturing Company have issued the following circular letter to central station men:

Dear Sirs: In view of the great prominence given to the multiphase motors covered by the patents of Mr. Nikola Tesla, we think it right to direct your attention to the fact that this company claims the exclusive right to manufacture and sell all forms of motors operated by currents of two, three or more phases, and all forms of single phase motors where a second phase is induced so as to make the same a two phase induction motor—notably the form used for the operation of fans. Suits are now pending against the Thomson-Houston Electric Company (the General Electric Company), the Stanley Manufacturing Company of Pittsfield, Mass.; and numerous suits have been entered against the users of apparatus purchased from the above companies; it being the intention of this company to enforce its exclusive right to manufacture and sell multiphase generators and motors, the two being used in combination as a system, and such system being covered by the patents of Nikola Tesla above referred to. In the first-named suits, the General Electric Company has put in its defence, and the Court has limited it to October 7, 1895, in which to complete its testimony, so that a hearing may be had in the latter part of this year or the beginning of 1896. We are advised that the defence has been unable to produce a single working device that can in any way take from Mr. Tesla the pioneer character of his inventions.

We have been informed that the two companies named have offered to guarantee the purchaser of infringing apparatus against damage or loss, but you can well appreciate that it will be impossible for such companies to make good their guarantees to cover all losses if the courts enjoin the use of apparatus made in imitation of that covered by Tesla's patents.

We are prepared to furnish multiphase generators and motors for all classes of work, and being the owners of the patents, no contingency can arise by which the purchasers of such apparatus made by us can in any way be interfered with in its continued commercial use.

It is the opinion of those who have given the subject most careful attention that in the near future a very large proportion of electric work will be done by the multiphase system, and this together with the fact that in the main we believe men would prefer to purchase property from its rightful owners, has led us to write to you and give you an opportunity to place your orders with this company for such multiphase apparatus as you may desire to use, and thus avoid the risks incident to the purchase of apparatus from unlawful manufacturers.

The adoption by the General Electric Company of the term "Monocyclic" in connection with their use of multiphase apparatus does not free them from the charge of infringement, but on the contrary makes the case against them stronger, because of the sale of apparatus under misleading terms.

In conclusion, we wish to call your attention to the fact that with our system incandescent lights, arc lamps and alternating motors can be operated from the same circuits, and that it will be of especial advantage to companies desiring to remodel or to increase their plants to make a full and careful investigation of the Tesla apparatus as installed in our works at East Pittsburg, and you are invited to come or send a representative, to whom every facility will be given for careful inspection. Yours truly,

Westinghouse Electric and Mfg. Co.

THE WARREN ALTERNATOR.

The Aim: In the construction of the Warren Alternate Current Generator the aim has been the embodiment in the simplest possible form of construction of all the most advanced ideas in the generation of the electric current, for use wherever and however it may be required.

The Idea: The fundamental idea has been a machine of perfect electrical and mechanical balance, of highest possible efficiency and regulation, and withal, a machine that will not burn out or require costly repairs; a machine which, aside from a due regard to lubrication, may be put into the most severe service and left to run perpetually without attention of any sort; a dynamo of slow speed and low frequency, which meets all the conditions of the best of the well-known types of alternators, but from which all hazard is eliminated; a machine built to earn money with instead of spending money upon.

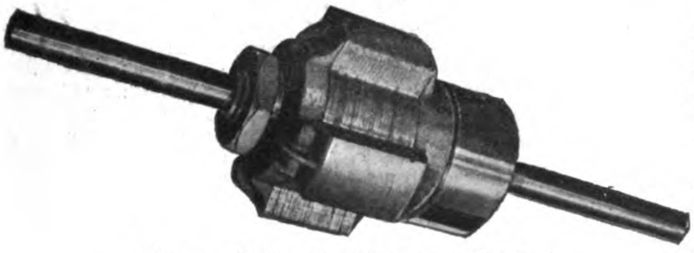

FIG. 1.—ROTATING MAGNETIC CORE.

The Design: In designing the Warren Alternator, the great consideration being simplicity and durability, the so-called inductor type of machine has been adopted. In working out the new design founded on this principle marvellous results have been attained—exceptionally close regulation and high efficiency (only one-half of one per cent. of K. W. capacity for excitation), smooth and noiseless running, no heating of any part, consequently no waste of energy.

Multivoltage: Its construction is such as to permit of various ways of connecting for different voltages without in any manner changing the machine or requiring new coils. It may be connected for a 110 or 220 volt system, and used without transformers for short distances, or for 1,000 or 2,000 volts to be used with transformers for long distance transmission; or it may be connected to operate a 110 volt circuit and a 1,000 volt circuit both at the same time.

Arc Lamp Service: Its low frequency (7,200 per minute) adapts it to operate arc lamps to greatest advantage and with perfect freedom from the hissing and humming noise at the lamp, so noticeable from alternating currents of the usual high frequency.

Simplicity: It is a dynamo, without collector rings or commutator, without brushes, without moving wires, without liability to burn out. Built wholly of steel in all its magnetic parts, it is massive and heavy but extremely compact; made for continuous runs without attention, and proportioned to run up to an enormous overload without wasting energy in heating any part.

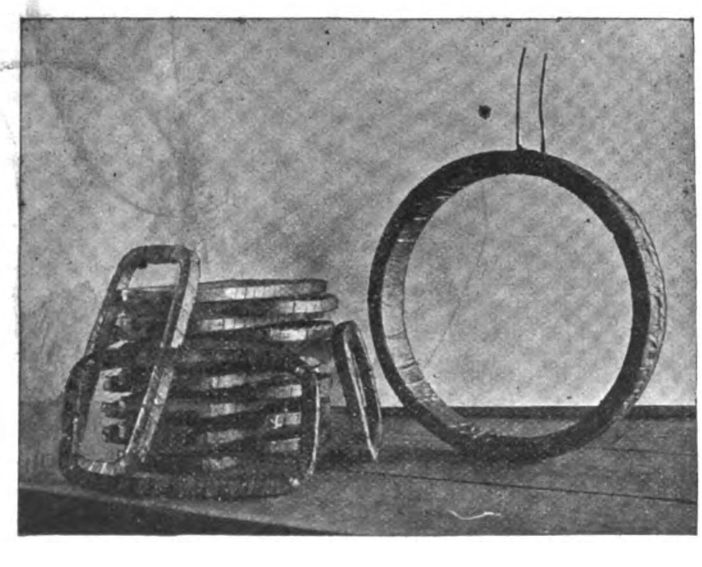

FIG. 2.—ARMATURE COILS AND EXCITING COIL.

Insurance Against Burn-Outs: The manufacturers will insure it against burn-outs (other than lightning discharges) for one-half of one per cent. on the purchase price per annum.

Armature Stationary: The armature coils being attached to the stationary removable laminated ring, which fits accurately into the bell-shaped steel frame, and exciting coil being attached to the steel frame; none of the coils being attached to any movable part it is clear that no brush or sliding contact is required.

The Rotating Magnetic Core: The revolving part consists of a cast steel cylinder, on which are pressed laminæ that form the rotary poles; thus constructed the revolving portion of the machine is simply a solid mass of steel, through the polar projections of which the magnetic flux is delivered to the opposite poles of the laminated annulus to which the coils are attached. In other words, the rotor is simply the core of a magnetic field—the rotating flux path. It is made to fill the opening in the closed end of the frame shell so closely, and the polar projections move so extremely close to the poles of the annulus, as to diminish the air-gap reluctance to the most inconceivably small fraction, as shown by the fact that less than one-half of one per cent. of the K. W. capacity of the machine is required for excitation.

The Coils: The armature coils as shown in Fig 2, are wound on forms; are small, and being attached to the stationary removable ring are easily replaced in case of an injury from a lightning discharge or accident. The cost of these coils is quite insignificant, only about $8 each. The large coil, shown in the cut, is the exciting coil, there being but one, and it also being stationary the extreme simplicity of the electrical features of the machine is apparent.

The Ensemble: The whole being composed of laminated parts and cast-steel, correctly proportioned, no heating is developed, even when running greatly overloaded. This has been fully proven by severe tests witnessed by many impartial engineers.

Mechanical: The mechanical features of the Warren Alternator have had most careful consideration. The exceptionally long self-aligning and self-oiling bearings carrying a forged steel shaft of great diameter permits running the rotor at the least possible clearance from the stationary parts, thereby reducing the reluctance due to the air-gap to the merest fraction.

The 40 and 60 K. W. machines will be built, as shown in the accompanying illustrations, frame cast of steel in one piece, making the most compact and durable form of construction known. In larger sizes the upper half will be cast separate and bolted to the lower half in the usual manner.

Appearance: No attempt is made at ornamentation for the purpose of handsome effect. Everything possible has been done for reliability, durability, ease of management and efficiency. Everything to avoid burn-outs, repairs and excessive cost of operation. The machine is, however, pleasing in appearance and impresses a thoughtful person with its solidity, simplicity and adaptation to the most severe and exacting service.

Why? The designer of this machine, Mr. C. C. Warren and Mr. H. B. Warren, having been pioneers in the practical every-day features of the electrical business, were long since made painfully aware of the limitations of alternators of the past, with their delicate and costly parts, the revolving wire covered armatures, their collector rings and brushes, and arbitrary single voltage service, set out to design a machine better adapted to earn money with, and less so for the purchaser to spend money upon for repairs, etc.

Frequency: The standard frequency will be seventy-two hundred alternations per minute at rated speed, but will be built for any frequency or speed desired.

Uniqueness: Its unique construction is such as to make it especially adapted to connecting direct to any engine for any speed.

A Siemens & Halske Steam Locomotive.

The first locomotive built by the Siemens & Halske Electric Company has just been completed. As is well known, that company purchased the plant of the Grant Locomotive Works at Chicago after the failure of the latter company, and the engine referred to is one of fifty five ordered from the Grant Company by the Chicago, Burlington and Quincy. Twenty of these locomotives will be built. The original design has been adhered to, and the locomotive is a ten-wheeler, adapted to either freight or passenger service.

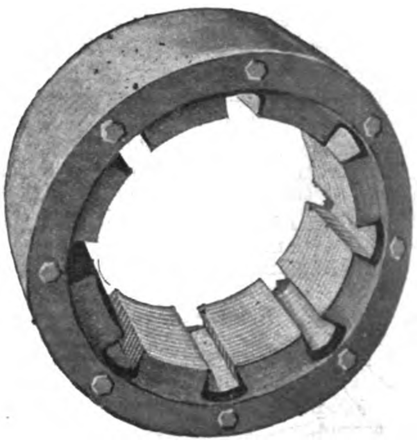

FIG. 3.—STATIONARY, REMOVABLE LAMINATED ARMATURE RING, WARREN ALTERNATOR.

Needs More Room.

Constantly increasing business has compelled the Standard Electric Company, Chicago, to contemplate the removal of its plant to some point near the city where more room can be secured for manufacturing purposes. Desplaines, Kankakee and other cities are making efforts to secure the location of the new plant. The first-named city has offered a bonus of $65,000 for the removal of the plant to that place.

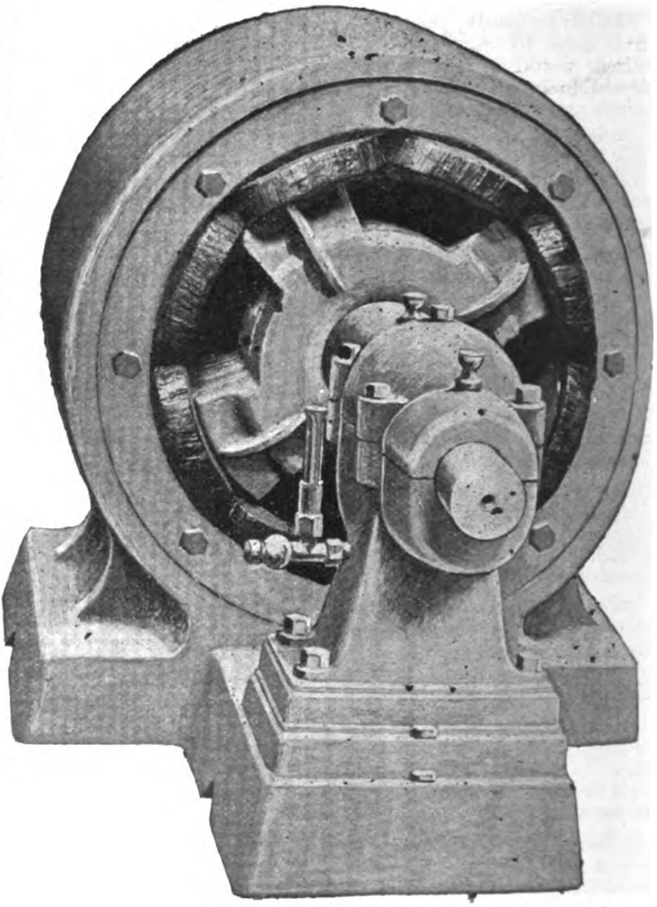

FIG. 4.—OPEN END SHOWING COILS AND ROTATING MAGNETIC CORE, WARREN ALTERNATOR.

The Card Company's Products.

The products of the Card Electric Company, Mansfield, Ohio, comprise generators and motors for any and all purposes to which electrical power may be applied. Multipolar slow-speed generators for power transmission or isolated lighting, multipolar slow speed stationary motors, reversible motors and controllers for rolling mills, bridges and traveling cranes, are among the forms of apparatus now manufactured by this company.

MOONLIGHT SCHEDULE FOR THE UNITED STATES.

(Issued by the Washington Carbon Company.)

BUSINESS HINTS.

Public Buildings, Theaters, Residences, &c., Proposed or in Course of Construction.

[The following summary is prepared weekly for ELECTRICITY for the information of advertisers and readers who are dealers in apparatus and articles required in the electrical equipment of public and private buildings.]

Alexandria Bay, N. Y.—The Thousand Island Club will erect a club house on Welcome Island, near Alexander Bay, this fall, at a cost of $100,000; the plans and specifications are now being prepared.

Atlantic Highlands, N. J.—A project is reported to be in progress for the erection of a hotel to accommodate 1,500 persons and cost about $1,000,000 at Chelsea Beach on the site of the Seaview Excursion House.

Brockton, Mass.—At a meeting of the Palace Hall Corporation it was decided to erect a $30,000 building at once.

Brooklyn, N. Y.—E. Iverson will build a four story double apartment house on 27th st., west of 5th ave.

Buffalo, N. Y.—Architects Swan & Falkner are preparing plans for a block of flats, to be four or five stories high, and have a frontage of 79 feet, and will be built on the west side of the city....Ground will be broken shortly for a block of stores and flats to be built by the Buffalo Cement Co., Ltd., at the junction of Main st. and Parker ave.

Chicago, Ill.—Holabird & Roche have prepared plans for a residence on Grand Boulevard, for George W. Shannon; it will be equipped for steam heating electric lighting, etc....Plans are being prepared by J. W. Kenevel for a six story apartment house to be erected on Michigan ave. and 56th st., by J. R. Trenton, who will expend $175,000 on the building.

Morristown, N. J.—Jesse Eddy, of the firm of Dickson & Eddy, 29 Broadway, New York City, has purchased a building site on Normandy Heights, on which he will soon build a $40,000 house.

New Haven, Conn.—John Cox is about to erect a hotel at Savin Rock, to be four stories, and equipped with modern conveniences.

Newport, R. I.—Joseph Mayer will erect an apartment house on Spring st., which will contain a dance and concert hall.

New York City.—John C. Burne, 101 West 42d st., not F. Dinkelberg, as previously reported, has been engaged to make the plans for the mercantile building which John Kehoe, the builder, is to erect at southeast cor. of Vestry and West sts.; it will contain the latest improvements, including passenger and freight elevators, steam heating apparatus, electric wiring and fixtures, etc.....Leopold True, 352 4th ave., will build a seven story store and lofts, 23 x 125, at 150 Bleecker st.; Van Campen Taylor, 1 Union Square, is the architect....Leith & Glen have commissioned Architects Neville & Bagge, 215 West 125th st., to make plans for 8 four story dwellings on north side of 136th st., east of 7th ave....John A. Knox, cor. Marion ave. and Tappen st., will erect a four story flat on the north side of 148th st., west of Brook ave., to cost $15,000; Architect W. C. Dickerson, 534 Willis Ave....Thomas R. White will build a five story apartment hotel, southeast cor. of St. Nicholas ave. and 118th st.; it will contain the latest improvements, including elevators, steam heating, electric wiring and fixtures, etc.; Architect Julius Munckwitz, 227 West 125th st.

Niagara Falls, N. Y.—Ex-City Engineer Albert H. Porter will erect a block of six residences, cor. Walnut ave. and 7th st., which will be lighted by electricity and gas.

Philadelphia, Pa.—James J. Brannan is to build a three story pompeiian brick dwelling at southwest cor. of Broad and Moore sts....Plans are being drawn by John Flynn for a large residence and stable to be built by Henry Weekey, at Perkiomenville; cost $50,000.

Pittsburg, Pa.—The Schiller's Glucke Gesang Verein will build a $30,000 hall opposite Holy Cross Church, on Carson st.

Savannah, Ga.—Marcus Klaw, of the firm of Jefferson, Klaw & Erlanger, 25 West 30th st., New York City, theatrical agents, has been in this city, with a view of building a theatre and office buildings here; estimated cost, $300,000.

INCORPORATIONS.

The Randall-Noble Electric Company, Bridgeport, Conn.—to manufacture and sell electrical appliances, etc. Capital stock, $2,000. Promoters: Purdy M. Randall, Bridgeport; R. C. Noble, South Windsor, Conn.; F. S. Noble, Staten Island, N. Y.

The Electric Railway Construction Company, Kansas City, Mo.—to construct electric railways, etc. Promoters: Eli S. Young, Willard E. Menner, Geo. Lane, Kansas City, Mo.

The Santa Clara Valley Railway Company, San Francisco, Cal.—to purchase, build, construct and operate a railroad to be operated by steam, electricity or any other motive power; construct telephone and telegraph lines, build and operate steamboats. Capital stock, $100,000. Promoters: H. W. Goodall, Frank Piper, Alfred E. Pryor, Charles Shurtleff, San Francisco; H. P. Thayer, San Jose; R. J. R. Adan, Vallejo; Andrew Rocca, Great Western Mine.

The Pueblo Electric Street Railway Company, Pueblo Col.—to purchase and operate property of the Pueblo City Railway Company. Capital stock, $500,000. Promoters: Albert E. Pattison, Elmer E. Whitted, Anthony C. Campbell, Irving Hale, Frank B. Gibson, Denver, Col.

L. A. Chase & Company Incorporated, Portland, Me.—to manufacture and deal in electrical and mechanical apparatus and appliances. Capital stock, $50,000. Promoters: Josiah H. Drummond, Jr., W. G. Chapman, Wm. H. Hatch, Portland.

The Clinton Telephone Company, Clinton, Tenn., has received its charter. Capital stock, $2,500. President and general manager, Dr. R. K. Medaris; vice-president, D. R. Coward; secretary, S. L. Slover, and treasurer, R. A. Shiflett.

The Manhattan General Construction Company, New York City—to manufacture machinery, electrical apparatus and other goods. Capital stock, $100,000. Directors: Charles B. Hill, Benjamin A. Gould, Jr., Cortland Betts, E. H. Floyd-Jones, and N. H. Swayne, 2d, all of New York City.

The South Chicago Terminal Railway Company, Chicago—to construct and operate a railroad from a point near the Calumet River to a junction with the belt line of the Chicago, Rock Island and Pacific. Capital stock, $ 0,000. Incorporators: J. A. Ames, of Streator; J. J. Coleman, of North Greenfield, Wis., and others.

The Ætna Electric Company (incorporated in West Va.), Hartford, Conn.—to manufacture, buy and sell incandescent electric lamps and parts thereof, electric light specialties, etc. Capital stock, $50,000. Promoters: Geo. S. Miller, Henry Green, Chas. F. Reinmann, Arthur E. Howard, Hartford.

The Macomber-Grayson Company, San Francisco, Cal.—to buy, sell and operate mines, mining properties, mills, mining machinery; construct and deal in dams, ditches, flumes, electric light and power lines; manufacture and generate power, light and heat produced by electricity, water, compressed air or steam. Capital stock, $100,000. Promoters: Chas. A. Macomber, George W. Grayson, Jr., Eugene H. Gould, Edw. P. Cole, I. I. Greeley, San Francisco.

The Pneumatic Manufacturing Company, Philadelphia, Pa.—to manufacture pneumatic, electrical and mechanical appliances and apparatus. Capital stock, $30,000. Promoters: Thomas R. Brown, New York City; James J. Martin, Thomas B. Shriver, Philadelphia.

The Hatch Storage Battery Company (incorporated in West Va.), Philadelphia, Pa.—to manufacture buy and sell storage batteries, electrical supplies under patent rights, etc. Capital stock, $5,000,000. Promoters: George D. Armstrong, John W. Bethel, Lewis C. Maus Theodore Hansen, Philadelphia.

The Falls Electric Power Land Company, Niagara Falls, N. Y. Capital stock, $150,000. Directors: J. C. Morgan, Richard F. Rankine, of Niagara Falls; Commodore P. Vedder, of Ellicottville; Jerome B. Fisher, of Jamestown, and Geo. H. Johnson, of Niagara Falls, Ont.

The E. A. Briggs Company, New York City—to carry on a hardware, crockery, stove, plumbing and electrical supply business, etc. Capital stock, $15,000. Directors: George Briggs, Elbert A. Briggs, and William F. Dudley, of New York City.

The Union Construction Company, Wilmington, N. C.—to engage in electrical and mechanical construction of all kinds, including electric railroads, telegraph and telephone lines, boats, bridges, piers, mills, waterworks, etc. The articles provide for the right to do business at any place in North Carolina or in any other State of the United States, with the right to have branch offices at Baltimore, Philadelphia, New York, Boston, Mass.; Norfolk, Va.; St. Louis, Mo.; Savannah, Ga.; Charleston, S. C.; New Orleans, La.; Chicago, Ill.; San Francisco, Cal.; or any other seaport or town or city where or in the vicinity of which dredging work is done. Capital stock, $100,000, which may be increased to $1,000,000. Incorporators: J. E. Challenger, Stephen Greene, and P. R. Foley, of Philadelphia, Pa.; John D. Bellamy, Jr., of Wilmington, N. C.; and H. H. Dougherty, of Newark, N. J.

ELECTRICAL PATENT RECORD.

Letters Patent Issued September 3, 1895.

ELECTRIC RAILWAYS AND APPLIANCES.

545,520. Trolley-Guard. James T. Moody, William Shawd, and Adam J. Baker, Springfield, Ohio. Filed Feb. 23, 1895.

545,649. Trolley-Arrester. Henry F. Hildebrandt, Rochester, N. Y., assignor of one-half to Martin C. Rutherford, same place. Filed May 6, 1895.

545,686. Trolley. Zachry T. Furbish, Augusta, Me. Filed July 12, 1895.

545,806. Trolley-Wire Support. John W. Meaker, Evanston, Ill. Filed Nov. 17, 1894.

545,833. Bond for Electric Railways. Elonzo S. Wheeler, Saugatuck, Conn., assignor of one-half to Clarence L. Wheeler, Marion Ind. Filed Jan. 14, 1895.

ELECTRIC LIGHTS AND APPLIANCES.

545,485. Adjustable Support for Electric or Other Lamps. Louis Goddu, Winchester, assignor to James W. Brooks, Petersham, and Frank F. Stanley, Swampscott, Mass., trustees. Filed March 30, 1894.

545,694. Electric-Arc Lamp. Rudolf H. Jahr, Opladen, Germany. Filed Nov. 26, 1894.

545,736. Electric-Arc Lamp. Rudolph Segerdahl, Chicago, Ill. Filed April 26, 1894.

54 ,7 5. Carbon-Holder for Electric-Arc Lamps. Thomas E. Adams, Cleveland, Ohio. Filed Feb. 15, 1895.

DYNAMO ELECTRIC MACHINERY, ETC.

545,524. Electric Motor. John O'Neil, New York, N. Y. Filed June 22, 1894.

545,551. Alternating-Current Generator or Motor. Elihu Thomson, Swampscott, Mass. Filed Sept. 29, 1891.

545,569. Electric Tool and Machine. Henry H. Bliss, Washington, D. C., assignor to Joseph A. Jeffrey, Columbus, Ohio. Filed Dec 24, 188 .

545,570. Electric Coal or Rock Drill. Henry H. Bliss, Washington, D. C., assignor to Joseph A. Jeffrey, Columbus, Ohio. Filed Sept. 6, 188 .

545,591. Electric Motor. Otto E. H. Kramer, St. Louis, Mo. Filed April 23, 1894.

545,592. Electric Motor. Otto E. H. Kramer, St. Louis, Mo. Filed May 10. 1894.

545,664. Method of and Apparatus for Controlling Current for Electric Motors. Thorsten von Zweigbergk, Cleveland, assignor of one-half to George C. Worthington, Elyria, Ohio. Filed Nov. 1, 1894.

545,670. Electric Transformer. William F. Brittin, Allegan, assignor of one-half to Edwin N. Howe, Coldwater, Mich. Filed Nov. 6, 1894.

545,693. Asynchronous Motor. Maurice Hutin and Maurice Leblanc, Paris, France, assignors to the Societe Anonyme pour la Transmission de la Force par l'Electricite, same place. Filed April 19, 1895.

545,853. Rotary Field-Motor. Alard E. Du Bois-Reymond, Berlin, Germany, assignor, by mesne assignments, to the Siemens & Halske Electric Company of America, Chicago, Ill. Filed Dec. 26, 1893.

TELEPHONE AND TELEGRAPH APPARATUS.

545,58 . Telegraph-Key. George F. Philbrook, Lisbon Falls, Me. Filed Jan. 19, 1895.

SIGNALING APPARATUS, ALARMS, ETC.

545,469. Electrical Signaling Apparatus. John H. Fildes, Chicago, Ill. Filed June 12, 1895.

545,494. Railway Block-Signal System. Alvah W. Hall, New York, N. Y., assignor of one-half to Alfred M. Collett, same place. Filed June 15, 1895.

545,653. Electric Alarm. William S. Hull, Dallas, Tex. Filed Nov. 26, 1894.

545,701. Semaphore-Signal for Railways. Jacob W. Lattig, West Bethlehem, Pa. Filed Jan. 5, 1895.

545,815. Electric Signaling Apparatus. Benjamin Price, Baltimore, Md., assignor to the Electric Selector and Signal Company of West Virginia. Filed April 24, 1894.

545,835. Electrical Burglar-Alarm. John R. Alexander, New Albany, Ind. Filed March 20, 1895.

MISCELLANEOUS.

545,495. Support for Overhead Electric Conductors. Melancthon Hanford, Malden, assignor to Charles J. Goodwin, Springfield, Mass. Filed April 25, 1894.

545,498. Electric Brake. William L. Hedenberg, New York, N. Y. Filed May 7, 1894.

545,5 3. Electric Igniting Apparatus for Gas-Engines. Henry Thau, New York, N. Y., assignor to James W. Irwin, same place. Filed Oct. 20, 1894.

545,6 0. Cleat for Electric Wires. Montraville M. Wood, Chicago, Ill. Filed Jan 11, 189 .

545,629. Safety Appliance for Electric Conductors. Adelbert E. Hutchins, Detroit, Mich. Filed May 5, 1893.

545,696. Electric Time-Check Receiver. Charles K. Jardine, Georgetown, British Guiana. Filed March 26, 18 5.

545,69 . Electrical Annunciating-Target. Otto Kauffmann, Sacramento, Cal. Filed Nov. 15, 1894.

545,726. Indicator. Benjamin F. Rittenhouse, Philadelphia, Pa., assignor of one-half to Henry E. F. Borzell, same place. Filed April 13, 1895.

545,819. Electric Insulator. Daniel M. Rothenberger, Lancaster, Pa., assignor of two-thirds to Charles A. Inglis and Edward D. Reilly, same place. Filed March 8, 1895.

THE TELEPHONE WORLD.

THE VIADUCT COMPANY ENJOINED.

The Western Electric Company Wins the Suit on the Watson Telephone Switch Patent.

In the case of the Western Electric Company against the Viaduct Manufacturing Company, Augustus G. Davis and John R. Johnson, of Baltimore, a decree was signed by Judge Morris, in the United States Circuit Court, on the 3d inst. declaring that a patent on an improvement in telephone switches had been infringed. The decree was signed by consent of the parties interested, and the defendants are to pay to the plaintiff $300 as damages. A perpetual injunction was also signed restraining the defendants from manufacturing or using instruments to which is attached the improvement. Ex Governor Whyte, and Fish, Richardson and Storrow represented the complainant, and Price and Stewart the defendants.

The patent upon which suit was brought is, next to the transmitter patents, one of the most important now controlled by the Bell Company. It is patent No. 270,522 and was issued to Thomas A. Watson, as assignor to the Bell Company, January 9, 1883. The patent is a broad one, as shown by the following full text of its claims:

1. In combination with suitable contact points and springs electrically connected with the call circuit and the primary and secondary circuits of a transmitter, the latter circuit including the hand telephone, a lever electrically connected with the main line in a telephone circuit, substantially as described, to bring in the hand telephone and transmitter and break the call circuit, or to cut out the hand telephone and transmitter and establish the call circuit, accordingly as the lever is moved in one direction or the other.

2. In combination with suitable contact points and springs electrically connected with call circuit and the primary and secondary circuits of a transmitter, the latter including a hand telephone, a lever electrically connected with main line and provided with a hook to support the hand telephone, and a spring tending to overcome the weight of the hand telephone, substantially as described, to bring in the hand telephone and transmitter and establish the call circuit, accordingly as the hand telephone is removed from or hung upon said hook.

3. In combination with suitable stops connected with the primary and secondary circuits of a transmitter, the latter including the circuit through the hand telephone and provided with a spring tending to overcome the weight of the hand telephone, substantially as described, to complete the local circuit through the transmitter, and at the same time connect with the main line the secondary circuit through the transmitter and hand telephone from the hook.

4. In combination with a magneto-generator, a main line telephone circuit and a shunt circuit passing through the magneto-generator, the push button U to break the shunt circuit, substantially as described.

5. A switch lever and contacts for connecting with the line wire either a telephone circuit or a call circuit, according to the position of the switch lever, in combination with the magneto-generator, its shunt and push button, the said magneto-generator being connected with the call-circuit, substantially as described.

6. In a telephone circuit, the spring-hook D adapted to support the weight of the hand telephone, in combination with the contact springs s^1, s^2 and s^3, connected with the transmitter, hand telephone and a signaling circuit, substantially as described for the purpose specified.

7. In a telephone circuit, the spring hook D, adapted to support the weight of the hand telephone, in combination with the contact spring s^1, s^2 and their connections, substantially as described, to automatically establish the primary local circuit through the transmitter, and at the same time bring into the main line the circuit through the hand telephone and the secondary circuit through the transmitter by taking the telephone from the hook.

8. A switch lever connected with the main line of a telephone circuit and movable in either direction, in combination with the contact springs s^1, s^2, s^3, the transmitter, the hand telephone, a signaling circuit and suitable connecting wire, substantially as described.

What One Company Has Done.

The achievements of the Home Telephone Company of Chillicothe, O., serve admirably to illustrate what an energetic, aggressive management can do in the independent telephone field. This company was organized in the spring of the current year by the election of the following officers: Judge James M. Thomas, president; Frank Harper, secretary; John H. Blacker, treasurer; and A. H. Reutinger, general manager. The capital stock of the company was fixed at $25,000, all of which was paid in before operations were commenced. The rates were fixed at $2.00 and $1.50 per month and in a very short space of time over 300 five-year contracts were made. The contract for the construction and equipment of the plant was given to the Western Telephone Construction Company of Chicago. The construction of the plant occupied about sixty days.

The Home Company give not only exchange service to residents of Chillicothe, but offer to subscribers, free of extra charge, connection with Clarksburg, Roxabell, Frankfort, Andersonville, Anderson Station, Sulphur Lick Springs, County Infirmary, Londonderry, Vigo, Richmond Dale and points intermediate. The lines now projected will give connection with Adelphi, Hallsville, Kinnickinnick and Kingston, and before long with Waverly, Portsmouth and Ironton.

The Telephone as Chief Marshal.

During the recent parade of the Knights Templar in Boston a new departure was made in the use of telephones. Upon a platform, with a telephone at his command and a switchboard connecting with a dozen or more circuits, sat the general director of the parade. All along the proposed line of the parade there were placed at convenient intervals men with telephones. Each one was able to take in at a glance a considerable section of the parade. When a break occurred anywhere in the line the observer telephoned the fact to the general director, and it many times happened that this director was aware of such break before the commander of the commandery knew it. The director was therefore able instantly to communicate with the commander, telling him to wait until his line had been reformed. Thus the whole parade, containing perhaps 50,000 men, moved with the speed, the good order and the ease of a battalion in a drill room.

Western Union Company Loses.

A decision was reached on the 3d inst., in the United States Court of Appeals at Boston, in the case of the American Bell Telephone Company versus Western Union Telegraph Company, in favor of appellant. The original suit was for an accounting from the Bell Telephone Company under certain alleged contracts. The plaintiffs alleged there was a large sum due them for royalties, which the Bell Company denied. The case was referred to a master in chancery, who decided against the Western Union Company, whereupon counsel for the latter moved the Circuit Court to allow them to dismiss the bill without prejudice. The motion was allowed, and the Bell Company took an appeal, claiming that the lower court had not the right to dismiss the bill. The Court of Appeals holds that the contention is right.

More Telephone Litigation.

The Missouri and Kansas Telephone Company and Frank R. Colvin, representing the attorneys of the Western Electric Company, have instituted suit in the United States Court at Leavenworth, Kan., against the People's Telephone Company of Leavenworth and the Anthony Company, Cincinnati, O., for alleged infringement of several telephone switchboard patents.

A Telephone Company in Trouble.

The plant of the Citizens' Telephone Company, St. Joseph, Mo. has been seized upon an execution to satisfy a judgment in favor of Henry F. Strong, secretary of the company. Strong's claim is for salary alleged to be due him and for which he obtained judgment in a justice's court. A majority of the stockholders, who now have an application for a receiver pending, will fight the case in the higher courts.

Coming to the Front.

To the Editor of ELECTRICITY.

DEAR SIR: I am glad to see you take the stand you do and congratulate you on the rapid manner you are pulling your paper to the front. Yours truly,

EDGAR L. MILLER,
Gen. Mgr the Inter-State Telephone and Telegraph Co.
Durham, N. C.

May Take Time for Answer.

When the case of the American Bell Telephone Company vs. the National Telephone Manufacturing Company was called in the United States Circuit Court at Boston on the 3d inst., attorneys appeared in behalf of the defendant company. The answer to the bill of complaint may not be filed before October 2 next.

Negotiations between the Mutual Automatic Telephone Company of Philadelphia and the Standard Telephone Company have inferentially led to the incorporation of the Standard Telephone and Telegraph Company, under the laws of New Jersey, and the inference drawn is that the new concern is to absorb the Mutual Automatic, and is to operate under the franchise of the latter concern.

The Lansing Telephone Exchange Company, Lansing, Mich., has upwards of 500 subscribers on its list, and expects to have its plant ready for operation within thirty days. The local Bell Company has 267 subscribers, and it is positively asserted that 251 of these have filed notices with the Bell Company that within 30 days they will terminate their contract with that company.

The "measured service" rates put into effect in Philadelphia, September 1, by the Bell Company, range from $90 per year for 800 exchange calls, a fraction over two and one-half calls per working day, to $156 per year for 2,400 calls, a fraction under 8 calls per day. For two-party 'phones the rates grade from $60 for 600 calls to $120 for 2,400 calls. These rates are for metallic circuit service and long-distance equipment.

John P. Persch, who was the promoter of the famous Automatic Telephone Company of Philadelphia, which got a franchise from councils under circumstances which created a scandal when an investigation was made, has secured the passage of an ordinance by the city council of Atlantic City, giving sweeping privileges to a corporation he represents.

The Millen and Stillmore Telephone Company, Millen, Ga., organized some time ago, with J. F. Gray president and general manager, has completed a thirty-six mile line between Millen and Stillmore. Telephone connection is now established with Millen, South Millen, Summit, Garfield, Monte and Stillmore.

The Saginaw Valley Mutual Telephone Company, Saginaw, Mich., has been practically promised a thirty year franchise by Saginaw, and will soon ask the Bay City council for a similar favor. The company agrees to rent 'phones for $30 and $24 per year, with $3 extra for valley service.

The business men of Chester, Pa., have urged the local Bell Telephone Company to reduce telephone rates. The company has refused to do so, and at a public meeting it was decided to support the recently incorporated Delaware County Telegraph and Telephone Company.

The Harrison Telephone Company of Detroit, Mich., has accepted the ordinance passed by the city councils of that city, and has commenced the construction of its plant. The complete exchange is to be in operation July 1, 1896.

Arthur Overshiner and M. P. Krom, of Anderson, Ind., who have a local exchange in successful operation at that place, are negotiating similar prejects at Summitville and Alexandria.

The Walton Telephone Company has been organized at Walton, Ga., by the election of W. H. Nunnally president and H. G. Nowell manager. The charter has been granted and work will proceed at once.

The Mutual Telephone Company, Butte, Mont., organized some months ago, and which has secured a franchise, is preparing to begin the construction of its plant.

The Commercial Telephone Company has secured a franchise with liberal provisions in Oakland, Cal. The company will expend $72,000 on its plant.

The Keystone Telephone Company, Pittsburg, Pa., is endeavoring to organize a local company at Mt. Carroll, Ill.

W. D. Fletcher, of Pendleton, Wis., is interested in the proposed telephone line to connect La Grange, Union and Elgin.

The Bell Telephone Company is preparing to extend its service to a number of the rural towns adjacent to St. Louis.

The New England Telephone and Telegraph Company has secured underground rights at Springfield, Mass.

Five thousand dollars has been appropriated to extend the police telegraph system of Jersey City.

The Philadelphia post-office has been equipped with Clamond telephones.

C. C. Davis is interested in the proposed telephone exchange at Colfax, Ia.

A telephone exchange is contemplated at Decorah, Ia.

ELECTRICITY.

VOL. IX. NEW YORK, SEPTEMBER 18, 1895. No. 10

ELECTRICITY

Published every Wednesday by the

ELECTRICITY NEWSPAPER CO.

S. E. GREENE, PRES'T. L. J. MONTGOMERY, SEC'Y.

PUBLICATION OFFICE:

6 Park Place - New York

EDITORS: NELSON W. PERRY. BURTON E. GREENE. R. H. WILLOUGHBY.

BUSINESS MANAGER, - - JOHN L. GANS.

SUBSCRIPTION RATES:

UNITED STATES,	$2.50
IN CLUBS OF FIVE OR MORE,	$2.00
FOREIGN COUNTRIES,	$4.50
SINGLE COPIES,	10 CENTS

ADVERTISING RATES:

As ELECTRICITY reaches all classes interested in electrical work, its value as an advertising medium can be readily appreciated. Rates will be sent on application.

Changes for advertisements should reach the office not later than the Saturday preceding the date of publication.

ENTERED AT THE N. Y. POST OFFICE AS MAIL MATTER OF THE SECOND-CLASS.

EDITORIAL NOTES.

There are still left in this trade a large number of men who have entered into it for their life work. They may be disheartened, but they have not given up. It is for them that we write. To them we present our argument, and to them we must all look for the re-establishment of business principles, the reinforcement of the doctrines of common sense.

It is for these men to consider just why wrong has temporarily triumphed over right, why it was possible for the tricksters and adventurers to bring the industry to its present condition.

And when these questions receive careful thought the only answer possible is that the electrical press has not done its duty.

If the "Electrical Engineer," the "Electrical World," the "Electrical Review" and the "Western Electrician" had faithfully done their duty by the trade they claim to represent, whose best interests they claim to guard, the present situation would never have confronted us.—"ELECTRICITY," June 5, 1895.

The Bell Company and the Opposition. The past week or two has been pregnant of results that bode ill for the prosperity of the independent telephone companies. The developments seem to show only too strongly the unwisdom of the petty jealousies which have prevented concerted action among those whose interests are adverse to the Bell interests and to substantiate the position taken by ELECTRICITY at the very start, that success could only be hoped for from united action.

In our issue of August 21, in commenting upon the suit of the Bell Company vs. the National Telephone Company, we stated that there was a strong suspicion among the independent telephone companies that the suit was merely a collusive one. While the circumstances were exceedingly suspicious, we expressed the hope that the suspicions might prove unfounded. Scarcely two weeks have elapsed and another circumstance has arisen which seems to go further in substantiating the fear than all of the others which preceded, and which when taken in connection with the others leaves little room for doubt that the National Company never intended to make a fight with the view of winning.

The case came up for hearing September 3d, and the attorneys for the National Company, after having put in an appearance, withdrew from the case without filing an answer. While the National Company has still 30 days within which to file an answer, this withdrawal of counsel is regarded as indicating that they propose to allow the Bell Company to take judgment by default.

This is a most extraordinary proceeding for a party to take which has endeavored to make the public believe that it would contest every inch of ground to the last ditch. It is more extraordinary from the fact that there were others standing ready to defend the suit without expense to the defendants, and who for the benefit of the independent telephone interests would have assumed the whole burden had they but been permitted to do so. This was the avowed object for which the independent telephone associations were formed, and no one knew this better than the National Company. The action of the latter company is therefore looked upon by others who are in the telephone business for legitimate purposes as inexplicable on any other grounds than collusion.

It may be that that opinion has been too hastily formed, for since 30 days must elapse from the date assigned for the hearing before judgment can be taken by default, there is ample time for the National Company to employ new counsel and make an answer; but it seems to us that the National Company owes to the public some explanation of its action, for without this it is certainly placing itself in an anomalous position if its intentions are honorable.

Another recent circumstance to which we would advert in this same connection is the giving of judgment by consent in the case of the Western Electric Company vs. the Viaduct Manufacturing Company of Baltimore. The cause of action was the use of a telephone switch used by the defendants alleged to be an infringement of the Watson patent controlled by the Bell Company. We printed the specifications of this patent in full in our last issue, and stated that according to the decree, which was signed by consent of the parties interested, the defendants are to pay to the plaintiff $300 as damages, and are served with a perpetual injunction restraining them from manufacturing or using instruments such as they had been advertising in the electrical papers as "the only automatic switch that does not infringe."

Reference to the Watson patent No. 270,522 shows that it is an exceedingly broad one. The first claim reads as follows:

> 1. In combination with suitable contact points and springs electrically connected with the call circuit and the primary and secondary circuits of a transmitter, the latter circuit including the hand telephone, a lever electrically connected with the main line in a telephone circuit, substantially as described, to bring in the hand telephone and transmitter and break the call circuit, or to cut out the hand telephone and transmitter and establish the call circuit, accordingly as the lever is moved in one direction or the other.

From this it will be seen that the claim is so broad as to make pertinent the question as to whether it is valid. It seems to cover practically all methods of switching electrical circuits in and out of action, being limited in its application only to electrical circuits including a telephone, a transmitter and a calling apparatus.

It is well known that efficient means of switching circuits were in use long prior to the advent of the telephone, so that unless the patent covered some specific method of accomplishing this that was new its validity could not be upheld. It is also a principle in patent law that the application of an old idea to a new use is not patentable.

Every one is familiar with the convenient arrangement employed in the Bell instruments by which the simple hanging up of the receiver throws out of circuit the local battery and connects in the calling apparatus, and how the removal of the receiver reverses things, cutting out the call and connecting the battery, rendering the line ready for conversation. It is probably the simplest arrangement that could be devised, and therefore the party owning the patented right to this device would have an advantage over another which had a more cumbrous one.

Outside telephone manufacturers, recognizing the probable validity of the Watson patent in its more restricted interpretation, have adopted other methods of switching which they believed more or less completely filled the requirements of convenience. One obvious method would be to have separate hand switches such as are used on central station switchboards for throwing in and out of action the various circuits. Such a method would undoubtedly be effective, but it would be less convenient than an automatic method. The Viaduct Manufacturing Company improved on this method in that by their device it was not necessary to use the hand directly on the switch, but by resting the arm on a lever, as is convenient when placing the receiver to the ear, the commutation of circuits was accomplished. The step between their method and that employed long before the telephone came into use was so slight from a technical standpoint, viz., the mere substitution of the pressure of the elbow for that of the hand on the switching lever, that it would seem that one method could not be an infringement without the other being an infringement also.

Without desiring at the present time to go into minutiæ in regard to the relative merits of the two devices—Watson's and the Viaduct Manufacturing Company's—it is quite safe to say that the latter company had an excellent chance to controvert the claims of the Western Electric Company in 1893 that its device was an infringement. This is the opinion of some of the ablest patent lawyers in this country.

In 1893 this company confessed judment, thereby acknowledging the validity of the Watson patent. Having consented to a decree at that time they could not, of course, in this latter case plead the invalidity of that which they had previously admitted, but why did the Viaduct Manufacturing Company so plead in 1893? Since that time they have been using a modified form of switch which they have given the public to believe was at least not an infringement. If they really believed that their new device was not an infringement why should they now consent to a decree without a struggle which forever debars them from using their new device? Was it because they did not have material upon which, at least tentatively, to base a defence? It could not have been on account of the cost of the litigation, because there were others ready in this case as in the National case to supply the sinews of war. We know that legal advice was offered them, but they laid down and with consent had judgment entered perpetually enjoining them from using that which they claimed to believe did not infringe, and to pay damages to the amount of $300.

These small damages, if the device used were actually an infringement, were certainly inadequate and give additional grounds for the suspicion that this case, like that against the National Company, was collusive. There be those who say that they shall not be surprised if both the National Company and the Viaduct Manufacturing Company shortly appear as licensees of the Bell Company, and that the price of the license was the "lying down" to which we have adverted. This lying down of the Viaduct Manufacturing Company has a deeper significance to the independent telephone people than may appear on its surface. In this case the Berliner claims do not figure, but it naturally arouses the fear of the public that having lain down in this case they would also lie down were they made defendants in a case involving the Berliner patents.

If, as would appear on the surface, they had no confidence in their own claims, they were deliberately misleading the public, and by this action have cast a reflection upon the independent telephone movement which will go hard with it in its appeal for public favor.

The two suits referred to, together with others which it is understood are ready for announcement in other portions of the country, show the energy with which the Bell Company is prepared to take the aggressive. They have already what probably will be judgment by default in Boston, a judgment by consent in Baltimore, and if they win in the other suits, judgments in still other jurisdictions. In our review of the Brush arc-lamp litigation we pointed out how effective a weapon early judgments for the Brush Company had been in maintaining the validity of an alleged infringement which ultimately was held not to exist in fact. We look upon these early victories of the Bell Company with alarm as tending to the same result. We believe that a few more such reverses to so-called independent telephone manufacturers as those to which we advert will effectually kill the independent movement. The latter cannot afford to allow suits against them to go by default, for each such judgment forms another strand in the rope which must be broken before those opposing the Bell Company can hope to triumph.

Our idea expressed last week, that the independent element should uphold the Government in its attempt to annul the Berliner patent has been received with considerable favor, and has done much to change the opinion of those who opposed the idea originally. It is unfortunate that in the reopening of the case no new evidence can be admitted, and that final judgment will necessarily rest upon the very imperfect evidence originally presented by the Government. But the mere fact of there being a case before the United States Supreme Court involving the validity of the Berliner patent would act as a stay in the lower courts should the defendants raise that plea.

It is improbable that the Government's case could be decided within any very limited time, and pending its decision any telephone company sued for alleged infringement of the Berliner patent would, if in earnest, apply for a stay. If they were in collusion and willing to sell out to the Bell Company, they would let judgment go by default or consent. Is the entering of the Government's suit on the record the cause of the action of the National Company, and is this to be followed by other similar procedures?

* * *

The latest reports stated that Mr. H. M. Byllesby was in Missoula, Montana, working in the interests of Mr. Coffin in reorganizing the Missoula General Electric Company. We do not think he will be successful—Electricity is well read now-a-days in every town in the Northwest.

Will Electrical Discovery Extend in New Directions?

So rapid and astounding have been the advances in electrical discovery that the public seemed more than justified in expecting at any time a revolutionary discovery that might render useless or antiquated all devices already in use. So firmly had the belief in some such cataclysmic discovery become only a few years ago, that many business men actually postponed for months the installation of new plants or the extension of old ones, in the full expectation that by so doing they would be enabled to avail themselves of something not then on the market and thus avoid a handicap that immediate investment would imply. Along in 1888 this feeling was so widespread as to actually hamper the electrical manufacturing business, but the continual and repeated postponement of predicted improvements has long since brought the buying public back to a feeling of confidence in the permanency of types upon which alone a healthy business can be supported.

As to the nature of these promised revolutions in the art, nothing definite was ever known. Sometimes it was the charlatan such as Pennock and Keely who was the authority for the hope. Sometimes it was the exaggerated interpretation of quiet hints that seemed to emanate from reputable manufacturers, but the public has now become better educated in the law of the conservation of energy and are no longer so easily gulled by the promise of something for nothing.

The conquests of electricity have been so astonishing that the unthinking were easily convinced of the possibility of almost anything if only electricity formed one link in the chain of procedure. Thus the proposition to operate an electric motor by the current from a dynamo driven by this same motor appeared as reasonable to those in the early days who now would see its fallacy at once.

A revolution has been going on, however, in a perfectly legitimate direction, viz., in perfecting the mechanical and electrical details of existing types. Greater attention has been paid to increasing the efficiences of apparatus, until now the electric generator and motor stand among the most efficient of energy transformers. Everything has been improved and cheapened, so that the theoretical limit has already been practically reached.

With the advent of the dynamo, chemical means of generating current came into disfavor, and to such an extent that the appellation "primary battery man," given to those who made, sold or experimented upon primary batteries became a reproach.

It was a reproach, however, not deserved by those interested in a legitimate way in this line of activity, and as predicted of old, the stone which the builders rejected may become the head of the corner.

In our best steam engines and boilers we seldom get more than 10 per cent. of the energy contained in the coal. The conversion of this energy into electricity involves a further loss of say 10 per cent., so that even with dynamos of the best make we seldom get more than 9 per cent. of the energy with which we originally started.

The galvanic or primary battery is far more efficient than this, giving us at once an efficiency of from 60 to 70 per cent. The trouble heretofore has been that our fuel, in this case zinc, and the atmosphere employed to burn it, acid, have been so expensive that notwithstanding the far higher efficiency of the battery, the energy ultimately cost many times what it could be produced for from coal through the intermediary of the boiler, steam-engine and dynamo.

The problem now is to find a cheaper fuel and atmosphere for our primary battery, and in proportion to the success which attends these efforts will the primary battery again meet public favor. There is no theoretical reason why a very cheap fuel for the battery cannot be produced, but it has as yet baffled all attempts. Perhaps a single discovery may revolutionize all of our present methods of electrical generation, but it will not involve a contradiction of the law of the conservation of energy. It is more likely to be along the line of chemical activity as distinguished from that of mechanical activity now in vogue. Nor is it likely to be the result of chance, but rather of long and painstaking research by chemists and physicists of ability. When it comes it will not be open to the suspicion that attaches to Pennockism and Keelyism, but will be along rational lines which can readily be understood when once explained. When it comes it will doubtless be so simple that the world will wonder and upbraid itself for not having seen how to do it before. It will doubtless dawn upon the world nearly full-fledged, as did the telephone and the phonograph, but its uses to man will be far more significant than have been any previous inventions.

* * *

Franchises for Electric Railroads. The question is an ever-recurring one as to the conditions which should be attached by a municipality to the granting of franchises within its jurisdiction. When these franchises are of a quasi-public nature it is difficult to lay down any definite rule that will apply equally well in all cases, but when the franchise is one that will clearly benefit only the one enjoying it, the course is clear. The beneficiary should in this case, of course, pay to the municipality an adequate sum for the privilege, just as a tenant in an office building pays rent for his offices. When, however, the new franchise implies a benefit to the municipality as well as to the projector it becomes a question of doubt in each case how far it is well to go in requiring tribute. The building of an electric railroad, a gas plant or a water system is of direct benefit to the community, but without a franchise which gives the promoters the right to reach possible customers such undertakings will not be begun. In the hope of profit, the projector is willing to invest capital, employ his time and pay a bonus for the opportunity commensurate with his hope of profit, but if the bonus required is out of proportion to the reasonable expectation of profit from the operation, the enterprise is nipped in the bud.

There are those who hold that franchises such as are implied in water, gas and electrical distribution should be vested solely in the government, but there are others who contest this view, and show, as they think, plainly that such ownership is not advantageous to the people. We are among those who believe that when the millennium comes, and political management is as economical and honest as private enterprise, then and not till then will municipal control be conducive to the best interests of the community.

The *Engineering Record* for September 14 editorially advances a compromise between municipal and private control that we think is new.

Its remarks are called forth by the opposition of the citizens of Montclair, N. J., to the granting of a franchise to the New Jersey Traction Company to occupy the streets of Montclair. It says:

"The convenience of such a road to some of the citizens, and especially to those in Caldwell and Verona, is conceded. A year or so ago the proposition would not have been entertained on any terms. Now there is considerable talk to the effect that if the company is allowed to run through the town 'the privilege is very valuable and they should be made to pay well for it,' either in buying right of way or in paying the town a share of receipts. The people of Montclair, as well as those of other communities, should not be blinded to the real and permanent issue in the operation of an electric railroad by such suggestions. This is the preservation of the streets through which a street railway runs in a decent and passable condition for the use of other vehicles than the electric cars. Experience in Orange and other towns where such roads are operated clearly demonstrates that railway corporations, agreements or no agreements, disregard the right of the rest of the public to the use of the streets for which the public have paid.

"The promise of a share of receipts is usually a phantom. Roads are often projected primarily that their promoters can make a profit in supplying the plant and in disposing of the bonds, the proceeds from which being the only money put into the enterprise. Yet the company is managed by stockholders who never paid a cent for their stock. In due time such a corporation frequently passes into the hands of a receiver, is reorganized, and the new management is free of any obligation that can be enforced by those who gave the original franchise."

Our contemporary offers the following suggestion as a solution of the difficulty. It says: "In view of these facts, which must be admitted, the authorities of Montclair should profit by the experience of other places. When it is decided to allow a trolley road to pass through the town, and a route is agreed upon, the rails should be put down by the town and their ownership and the right of way remain vested in the town. The railroad using it should pay a rental or toll for the privilege of running their cars over these rails; when they cease to pay the rent they cease to run, or in other words, they be dispossessed so another tenant that will pay may be secured. In determining what this sum shall be, reliable expert advice should be obtained, and among other considerations the following items of cost must be taken into account: Changing the cross-section of street so that the crown will be at the minimum, to render carriage travel possible between the rails and curb; to maintain a suitable pavement alongside the rails and the macadam of the street, which necessitates continuous attention; to maintain a bond between the rails, and in addition a return wire of sufficient capacity to carry the return current; the cost of restoring water and gas pipes destroyed by electrolysis.

"If a trolley road is built and operated on these conditions it can be a useful public servant."

Under the Searchlight.

Views and Opinions on Timely Topics.

WE understand that Mr. John I. Beggs intends to retire from Cincinnati as gracefully as possible within a few months, and that he has accepted a position with the New York Edison Company. We welcome our old friend I John back to New York, and have no doubt he will add to the gayety of electrical life in the metropolis.

* * *

BY the way, would it not be a strange coincidence if there were to be another fire at 44 Broad st. about the time Mr. Beggs returns to New York?

* * *

THE stockholders of the United Electric Securities Company at their annual meeting last week adjourned for one week, no quorum being present. Our latest advices were that Mr. C. A. Coffin was to be dropped from the Board, but we suppose this is the expression of desire on the part of the majority instead of actual intent.

* * *

A STRAW showing the direction of the wind in the general telephone business is the announcement in a Detroit paper that the Harrison Telephone Company may not file its $25,000 certified check to carry out its franchise in that city. It is also stated that the Harrison Company in Indiana has abandoned its Anderson franchise, and Chicago papers report that it will give up its Fort Wayne, Terre Haute and Indianapolis franchises. These franchises were of course procured at some expense, and the only inference is that in the light of recent developments in patent litigation it is not considered advisable to put in new exchanges.

* * *

A SPECIAL to the *New York News Bureau* states that evidence has been presented to the United States District Attorney at Chicago, by President Keelyn of the Western Telephone Construction Company, to show that the American Bell Telephone Company is violating the anti-trust law. Its contract with the Western Union Telegraph Company is quoted as evidence.

A Sure Winner.

(From the Marine and Railway Gazette.)

ELECTRICITY wins new successes each day that comes.

* * *

WE are not surprised to learn that the Boston Incandescent Lamp Company were one of the first of the half-dozen smaller incandescent lamp makers who have already retired from the field. They were among the strongest adherents to the notion that lamps could be sold at less than shop cost at a profit.

Personal.

Mr. Stanley S. Stout, of Chicago, spent several days in New York last week.

Mr. J. B. Crouse, of the Crouse-Tremaine Carbon Company, Fostoria, Ohio, was in New York this week closing some large orders for carbons.

Electric Lighting of Brussels.

There are few if any places in England where electricity used for lighting purposes can be said to have reduced appreciably the consumption of gas. In many towns it has had the effect of increasing the gas consumption by making the companies turn their attention to cooking and heating. There is a Continental instance, however, where it has had an opposite effect. The electric lighting of Brussels, which is worked by the municipality, has during the year reduced the gas consumption by 17½ million cubic feet. The central station plant there was started in November, 1893, at a cost of £100,000. There were three boilers of 2,500 square feet of heating area, two 500 H. P. engines and four dynamos of 143 units, and a battery of 140 cells of accumulators to give a current of 350 amperes for 10 hours. In February, 1895, another engine of 500 H. P. was put in for extensions and at present another station—a smaller one—is in course of construction for local demand. The India-Rubber, Gutta-Percha and Telegraph Works Company is running the installation for the municipality. The mains laid are 8¾ miles and the feeders 11,900 yards, the number of lamps being 11,655. For the first year the system has worked at a profit, but gas critics naturally say it has not been a success.

London Notes.

THE BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.

(From our London Correspondent.)

LONDON, September 7.

This year's meeting of the British Association is to be held at Ipswich from September 11th to 18th. The retiring president is Lord Salisbury, K. G., D. C. L., F. R. S., and Sir Douglas Galton, K. C. B., etc., the president-elect, will assume the presidency and deliver his inaugural address on the evening of the 11th inst. On the 18th inst., at 8:30 P. M., a discourse of especial interest will be delivered by Prof. Silvanus B. Thompson, his subject being "Magnetism in Rotation." The professor will use a number of experiments for illustration.

Apart from these general arrangements, the proceedings will, as usual, be divided off into a number of sections for the consideration and discussion of the various branches of scientific subjects, and there will also be the usual excursion parties to places of interest in the neighborhood of Ipswich.

Section G is the one in which most of the papers on electrical and kindred subjects are delivered, but the programme which has been drawn out up to the time of writing contains nothing of a very striking character. Mr W. H. Preece, C. B., F. R. S., is to report some notes of further advance in "Telegraphy by Induction," a subject which, with the aid of assistants, Mr. Preece has made essentially his own. Mr. Philip Dawson—a frequent writer in the British technical journals on traction subjects, and assistant to the late Mr. Anthony Reckenzaun—will read a paper on "Modern Applications of Electricity to Traction."

The subject of light railways, which has occupied so much attention during the present year, is to be treated by Major General Webber, who will also discourse on "The Development of the Telephone in Agricultural Districts." This is not the first occasion upon which Major General Webber has endeavored to tackle this matter; he has great hopes as to what the telephone may do in rural districts in helping the farmer and the village tradesman, but his proposals have not been altogether satisfactorily received in certain quarters.

Mr. W. H. Preece, in a second paper, will deal with "Glow Lamps," Mr. A. K. Bennett with "Telephony" (doubtless a reiteration or expansion of some of the facts given in his recent book, lately reviewed in these columns); Mr. P. V. Luke (the Deputy Director of Telegraphs in India) will deal with "The Field Telegraph in the Chitral Campaign," and Messrs. W. H. Preece and A. P. Trotter will contribute a paper on "A New Portable Photometer"; Mr. W. H. Earle will have a paper on "The Chloride Battery," while the Borough Analyst of Ipswich will discuss "Deodorizing Sewage by the Hermite Electrical Sanitation Process," which process was adopted for Ipswich a year or so ago.

It is almost certain that Lord Rayleigh or Prof. Ramsay, the "Argonizers," who sent last year's meeting and the scientific world in general into temporary hysterics on account of their alleged discovery, may have something more to say this year.

The "Electrification and Diselectrification of Gases" will be treated by Lord Kelvin, Magnus Maclean and Douglas Galt.

ROYALTY AND ELECTRICITY.

The provincial pressman is putting about at a penny-a-line some reports about Her Majesty Queen Victoria's dislike for and opposition to electricity. It will be seen how likely it is that this report is correct when I mention that at Osborne House there is a most perfect electric lighting installation, all the various departments being lighted in this manner. In addition to this, there is at one of the sovereign's residences an electric cooking outfit, by means of which the more delicate dishes are cooked.

RESEARCHES ON THERMO ELECTRICS.*

When Prof. Dewar succeeded in perfecting his now classical apparatus for producing exceedingly low temperatures, we anticipated that it would never remain a mere scientific curiosity, but would, in the hands of the professor, very soon be put to practical application. Our anticipations have been fully justified. Prof. Dewar has already, in the comparatively short time which has elapsed since his first epoch-making lecture on low temperatures, enriched our knowledge with discoveries which, but for him, would probably have been delayed for years; and it is clear that the researches which he has so far carried out are but an earnest of those which are to follow.

Recently Prof. Dewar has been collaborating with Prof. Fleming in an investigation, the object of which has been to throw some new light upon the thermo electric powers of metals and alloys at temperatures between the boiling point of water and that of liquid air. Their results are to be found in the *Philosophical Magazine;* but the authors have kindly favored us with a reprint.

We owe most of our knowledge up to the publication of this paper to Prof. Tait and Lord Kelvin. It was the latter's researches on thermodynamics which suggested to Prof. Tait the starting point for that work, the outcome of which was to show that on certain assumptions the curve representing thermo electric power plotted as a function of temperature should be straight lines, and consequently that the lines of thermo-electromotive force obtained by plotting as ordinates the E. M. F. in a thermo electric circuit, one junction of which is kept at a constant temperature whilst the temperature of the other is varied, should be parabolas with their axes vertical if plotted in terms of the variable temperature as abscissæ; but Prof. Tait's deductions were based upon experiments within the limits of the temperatures which can be reached by mercury thermometers and certain temperatures above that range. Nevertheless, these experiments confirmed Prof. Tait's conjectures for a large number of thermo-couples, although they led to the remarkable discovery that the thermo-electric lines of certain metals, notably of the magnetic ores, are for temperatures above 0° C., broken lines characterized by sudden changes of direction.

It has been the business of Profs. Dewar and Fleming to carry out experiments during which the temperature was lowered to −200° C. by the employment of boiling liquid air and oxygen. The data thus gathered have enabled them to continue the well known thermo electric diagram of Prof. Tait down to temperatures not very far removed from the absolute zero. This diagram, which, by the way, enables the temperature of inversion to be determined by inspection, may now be said to exhibit more elegantly and completely than ever the chief thermo electric facts.

The metals used were for the most part in the form of wires. From these a large quantity of thermo-electric couples were prepared, each consisting of two wires of lead joined by an intermediate wire of one of the following metals, viz., platinum, gold, palladium, silver, copper, zinc, cadmium, magnesium, tin, iron, nickel, pianoforte steel wire, Hadfield's manganese steel (non-magnetic and magnetic), manganin, german-silver, platinoid, bismuth (pure and commercial), antimony and aluminum; a carbon filament from an incandescent lamp was also coupled with lead.

The experimental difficulty encountered was that of determining the low temperature and the instant when the E. M. F. of the couple was made. Needless to say, this was after long preliminary investigation solved, and the apparatus finally used was based upon the employment of a platinum thermometer for measuring the temperature and a measuring instrument which could be changed instantly from a potentiometer into a resistance balance. This involved an expenditure of ingenuity such as invariably characterizes the apparatus with which Prof. Dewar conducts his researches. His account of the expedients to which he found it necessary to resort is well worthy of careful study by those who are young at experimental investigation.

The laborious work entailed by taking and reducing the observations recorded, as well as by the construction of some of the apparatus, was largely assisted in by Messrs. Morris and Jakeman. In the case of each couple a series of numbers for each metal representing at defined temperatures the thermo-electromotive force of that metal against lead was obtained; and all these observations were reduced to a statement of the E. M. F. in C. G. S. units of a couple formed of a given metal and of chemically pure lead, one junction being at 0° C. and the other being at a platinum temperature, *p t*, as defined by the standard platinum thermometer. The corrected results are graphically shown plotted down in a chart in the original paper. The lines of thermo-electric force thus found are in all cases curved. Wherever the curve has a maximum point so that its tangent becomes parallel to the line taken at the axis of temperature, the temperature at which this occurs is the neutral point of that metal with regard to lead. If, at any temperature, the tangents of the curves of two metals are parallel to one another, that temperature is the neutral point of these two metals with regard to each other, or is the temperature of inversion.

The diagram of thermo-electric powers can be at once obtained from that of the thermo-electric force by drawing a series of lines, the ordinates of which represent to proper scale the *slope* of the curves of thermo electric force.

The chief interest attaching to these investigations is obviously the ability to determine whether, over wide limits of low temperature, the thermo-electric lines of various metals remain in straight lines, and whether any of the metals exhibit changes of thermo-electric power at low temperatures which cause thin thermo-electric lines to be bent or broken, thus indicating a sudden change in the sign or magnitude of the "Thomson effect" at certain temperatures. The chart which has been constructed by Profs. Dewar and Fleming is capable of giving all the information that can be required, and thus of providing the data necessary for a full discussion of the subject. They, however, reserve a discussion of the interpretation of these thermo-electric curves and the bearing of the facts they disclose on the usually accepted thermo-electric theory for a future paper. Meanwhile we are glad to notice that they propose to convert the chart of electromotive forces into a chart of thermo-electric power, in which condition it will lend itself to a discussion of results. We shall await the publication of it with special interest.

Relative Heating Properties of Various Sources of Light.

Prof. Palaz gives the following figure as to the relative heating effects of different illuminants: Arc light, 4; incandescent light, 14; kerosene, argand burner, 331; gas, argand burner, 380; candle, 473; gas, butterfly burner, 511.

CHAPTER XI.

The Mitchell Plant and the Mitchell Electric Company.—III.

It will be remembered that the official statement of the earnings and expenses of the "Mitchell Electric Company" for the year ending February 28, 1893, as printed last week, showed net earnings, aside from fixed charges, amounting to $23 07. But the plant was not in operation the whole of the period covered by the statement, it having been shut down during part of the month of October and the whole of November. It might therefore be argued that the net earnings would have been larger if the station had run without interruption. We concede the point, but it is certain that the increased net earnings resulting from uninterrupted operation for the whole period would not have materially added to the value of the property as an investment, or justified the founding of a company on it, nor would it have relieved the parties directly responsible for evolving and carrying out the fraudulent scheme.

We can readily form a fair estimate of the maximum earning capacity of the plant during the time it was shut down by taking the average income per month for the last three months of the fiscal year, namely, December, January and February. The average of these three months would be somewhat too high. During these months the total income from incandescent service was $1,1 2.08 and from arc service $447. The average per month for the former is $397.36 and for the latter $149.00, and for both $546.36. Substituting this amount for the decreased earnings for October and adding a like amount for November, we have the estimated earnings for these two months of $1,092.72. From this sum should be subtracted the amount of money needed to supply coal for two months, and the proper proportion of expense for lamp renewals, carbons and other supplies, and for general expense. Making these deductions, and allowing for the time which the plant was shut down that it would have done as well as it did for the last three months of the year, we find there would still have been a large deficit.

We will now devote some space to the consideration of the monetary returns from the incandescent service. During the ten months of uninterrupted running of the station, the gross receipts from supply of current for incandescent lights amounted to $2,948.07. The price charged per kilowatt hour for the energy delivered to the lamps was 20 cents. The average service per month on the incandescent circuits was therefore 1474 35 kilowatt hours.

With this knowledge of the price per K. W., and the total K. W. delivered, it is quite easy to form a correct estimate of the returns per month per lamp from the incandescent service.

It is well understood that an incandescent lamp of any type demands a certain amount of energy to bring it to its normal degree of brilliancy; the amount of energy required, however, may differ within practically somewhat narrow limits by reason of the selection of a more or less efficient lamp—that is, a lamp which requires more or less energy to bring it up to its normal C. P. In forming an estimate of the actual income per lamp, we propose to give the plant the benefit of all doubts, and to take a lamp of rather high efficiency as the standard. We shall assume that lamps were used of 3.1 watts per C.P. Such a lamp for alternating current service requires approximately one ampere and 50 volts to bring it up to 16 C. P., or the expenditure of 50 watts for the maintenance of its normal brilliancy.

Since the average income per month for incandescent service is $294 80, this at 20 cents per K. W. hour, practically equals 1,474 K. W. hours per month, and if one lamp takes 50 watts, then by dividing 1,474 K. W. by 50, we get 29,480 lamp hours, which is equal to 1 cent per lamp hour (a common rate) and the total capacity of the station was 500 lamps. This would give a service equivalent to two lamp hours per day, and yield an increase of 2 cents per lamp per day, 60 cents per lamp per month, or $7 20 per lamp per year, which is probably considerably higher than the actual results. The probabilities are that the lamps used would be much nearer 4 watts per candle, or about 25 per cent. lower in efficiency than we have assumed, and the result so far as income is concerned per lamp hour would be about 25 per cent less, or approaching 1½ cents per lamp per day, or 45 cents per lamp per month, or $5.40 per lamp per year. Within these two extremes it was perfectly possible for any intelligent electrical engineer to definitely state just what might be expected as the gross revenue of such a station, and with the statement of the efficiency of the lamp used on the circuit the margin for doubt in the estimate of the gross returns or net earnings would be very much reduced. As a matter of fact, at the time this Mitchell Electric Company's plant was started there was no difficulty in anticipating and stating just what revenue might be expected, and very closely what expenses would be incurred in operating the plant.

But there is no need to speculate or theorize as to what this Mitchell Electric Company's plant *might* have done for the first year after its capitalization of $35,000 if it had not been compelled to shut down for repairs for nearly two months.

We have at hand the record of the plant for the twelve months ending December 31, 1893, during which period the plant suffered no interruptions. This record we present herewith:

[COPY.]

MITCHELL ELECTRIC COMPANY.

STATEMENT OF EARNINGS AND EXPENSES FOR TWELVE MONTHS ENDING DECEMBER 31, 1893.

Earnings.

	Arc.	Inc't.	
January	$144.00	$383.69	
February	141.00	338.39	
March	141.00	332.80	
April	141.00	342.50	
May	139.80	253.19	
June	141.00	283.43	
July	141.00	180.63	
August	141.00	209.69	
September	291.00	395.59	
October	141.00	290.83	
November	141.00	474.51	
December	141.00	440.67	
Total	$1,8 3.80	$3,880.92	$5 724.72

Total earnings brought forward		$5,721.72
Credits.		
Wages engineer and fireman	$1,175.00	
Salary officers and clerks	260.00	
Fuel	2,150.27	
General expense	209.97	
Lamps	94.74	
Repairs to electric plant	68 83	
Repairs to steam plant	36.77	
Oil and waste	70.47	
Boiler compound	103.18	
Insurance	208.85	
Carbons	57.00	
Discount	117.48	
Traveling expense	65.66	
Water	8.00	
		4,650.67
Net earnings		$1,074.05

The above shows apparent net earnings from operation of $1,074 05. In the official trial balance of December 31, 1893, we find the item of "Notes payable, $13,364.65." The fixed charges of the plant, therefore, were at least—

Interest on bonds ($15,000 issued)	$900.00
Interest on notes	1,336.46
Total	$2,2 6.46
Deduct net earnings	1,074.05
Deficit	$1,162.41
And to show how far the plant fell short of being a sound enterprise, we must add—	
6 per cent. interest on stock ($15,000)	900 00
6 per cent. depreciation on cost of plant ($19,777.64)	1,186.65
Total deficit	$3,249 06

With the facts before us, we can estimate with exactness just what increase in the incandescent service would have been required to make a paying property of the Mitchell plant (for it must be borne in mind that there was absolutely no hope of extending the arc service). The net earnings from operation for the year ending December 31, 1893, were $1,074.05. To meet fixed charges, depreciation and dividends would have required $4,323.11, leaving a deficit of $3,249.07. To overcome this shortage with a revenue of $7.20 per lamp per year, it would have been necessary to take on about 450 new lamps without taking into consideration one cent of expenses for the operation of these additional lamps. Can there be any better proof of the absolute hopelessness of the financial success of the Mitchell Electric Company?

It is worthy of notice that the total income for December of 1892 (as shown last week) was $632.17, and for December, 1893 (as above), $581.67. The boom in the electric lighting business had not materialized in the town of Mitchell, S. D., (population 2,205).

Some of our readers may be interested to know just why the plant started in the new station February, 1892, should be compelled to shut down a part of one month, and entirely shut down for another month, only eight months after the date of starting. We will explain this matter fully. In the section of South Dakota in which this plant was located the water obtainable is quite strongly alkaline and contains quite a large percentage of mineral matter per gallon. During its evaporation it therefore leaves behind a large amount of solid residue which forms scale and mud in great abundance. It will be noticed that quite a large amount of boiler compound had been purchased and used during the time of operation of the plant, and this boiler compound was intended to keep the boiler free from such an accumulation of mud and scale as would lead to injury. Notwithstanding the fact that so much of this boiler compound was used, the mud and scale accumulated to such an extent as to result in serious injury to the sheets of the boiler by burning. From this cause the boiler was so seriously injured in October, 1892, it was really dangerous to run it. With the water available in that section of the country a mud drum should have been put in to prevent the accumulation of sufficient scale and mud to prevent such serious injury—but it was not done. In addition to this trouble, however, the Atlas engine first put in was found incapable of rendering satisfactory service. These engineering blunders or oversights led to the necessity for a reconstruction of the station, and it was decided to add another 100 H. P. Atlas horizontal boiler and to take out the Atlas engine and replace it by a Ball tandem compound engine. The cost of the second Atlas boiler would of course not exceed the cost of the first, and the cost of its erection would be somewhat less than that of the first boiler, but this would be more than compensated for by the cost of repairing the first boiler to make it safe. The cost for repairs and erection of the second boiler should not have exceeded $2,400, while the maximum cost of the Ball tandem compound engine should not have exceeded $1,800, and this last item was actually reduced by allowance of $800 for the Atlas engine. This allowance should fully cover the cost of foundations and erecting the Ball engine. The cost for the additional steam plant would therefore be about $4,200. With the new boiler it became necessary to add additional room to the building and to purchase additional property. The entire additional cost for building and land raises this one item of investment to a little over $1,700.

We have in our possession the official schedule of the property of the Mitchell Electric Company at the close of the first fiscal year of its existence and after all these changes had been made. This schedule of the property does not give the values of the articles included in it. We herewith present a copy of this official schedule, to which we have appended the cost of articles enumerated therein:

[COPY.]

MITCHELL ELECTRIC COMPANY.

Mitchell, South Dakota.

SCHEDULE OF PROPERTY, FEBRUARY 1, 1893.

(Photographs and Plans on File.)

Real Estate:		
Lots 10, 11 and 12 in Block 49, Cooley & Gurnsey's Addition (adjoining C. M. and St. P. R. R. tracks)		$225.00
Frame building containing:		
Dynamo room, 24 x 40	$576.00	1,504 80
Boiler room, 39 x 36	782.40	
Coal shed, 16 x 28	134.40	
Coal shed addition, 5 x 8	12.00	
Steam Plant:		
One Ball Tandem Compound Engine, 11 in. x 19 in. x 14 in.		1,800.00
Two Atlas H. R. T. Boilers, 66 in. x 16 ft. with 64 4 in. tubes each		2,000.00
One Buffalo Duplex Steam Pump, 6 in. x 4 in. x 6 in.		125.00
One Artesian Well Pumping Engine, 6 in. x 24 in.		850.00
One Iron Water Tank 48 in. x 14 ft.		175.00
One Wainwright Corrugated Water Tube Heater, 150 h. p.		160.00
One Globe Injector		45.00
Three Steam Gauges, 8 in.		24.00
One Nathan Double Sight Feed Lubricator		18.00
Two Detroit Lubricators, 1 pint and ¼ pint ($7, $3.25)		10.25
Steam and water piping and valves		250.00
Settings and foundations for boilers and engines		500.00
Belts:		
One leather belt, 53 ft. long x 14 in. wide		93.28
One " " 88½ ft. " x 8 in. "		33.12
One " " 7½ ft. " x 8 in. "		12.75
One canvas " 8½ ft. " x 7½ in. wide (extra)		16.94
Electric Plant;		
One K 12 Arc Dynamo, No. 3,417, capacity 30 1,200 c. p. lamps		850.00
One A 70 Alternator, No. 617, capacity 1,300 16 c. p. lamps		2,200.00
One D 3 S Exciter Dynamo, No. 2,043, 110 volts.		182.50
Sixteen 1,200 c. p. arc lamps (in use) @ $25		400.00
Seven " " (in stock) @ $25		175.00
One Controller Magnet for arc dynamo (included in price of dynamo)		
One buckle switch for arc circuit		10.00
One Lightning Arrester for arc circuit, No. 4,901, Type A		7.00
Two Lightning Arresters for incandescent circuit, Nos. 1,010 and 1,011		14.00
One D. P. Switch, 75 ampere, for incandescent circuit		10.00
One S. P. Switch, 30 ampere, for incandescent circuit		3.00
One Current Indicator, 72 ampere, for incandescent circuit, No. 1,685		20.50
One Current Indicator, 34 ampere, for incandescent circuit, No. 745		20 50
One Potential Indicator, 64 volts, No. 773		30.00
One Ground Detector, Type A No 112		15.00
One Rheostat Type 43, No. 4,362		40.00
One " Type 65, No. 5,024		20 00
One Station Transformer, Type 18, 52 volts, No. 15,818		120.00
One Arc Cut-out		3.00
Foundations for dynamo		100.00
Total		$11,519.11

Total brought forward	$11,519.11
Pole Lines:	
30 40-foot poles	erected, 1,979.00
94 30- " "	
18 30- " " (in stock)	
6,816 ft. No. 2 wire	
40,361 ft. No. 6 wire	
1 coil No. 2 wire (in stock)	
1 reel No. 4 wire (in stock)	
120 4-pin cross-arms	
5 2-pin "	
24 4-pin " (in stock)	
9 2-pin " (in stock)	
4 break-arms	
Transformers:	
Two 1—E, Twelve 2—F	erected, 3,426.00
Nine 2—E, Six 3—F	
One 3—E, Nine 5—F	
Two 5—E, One 1[illegible]—F	
One 8—E, Eleven 8	
Two 25—B, One 5	
Eight 1—F

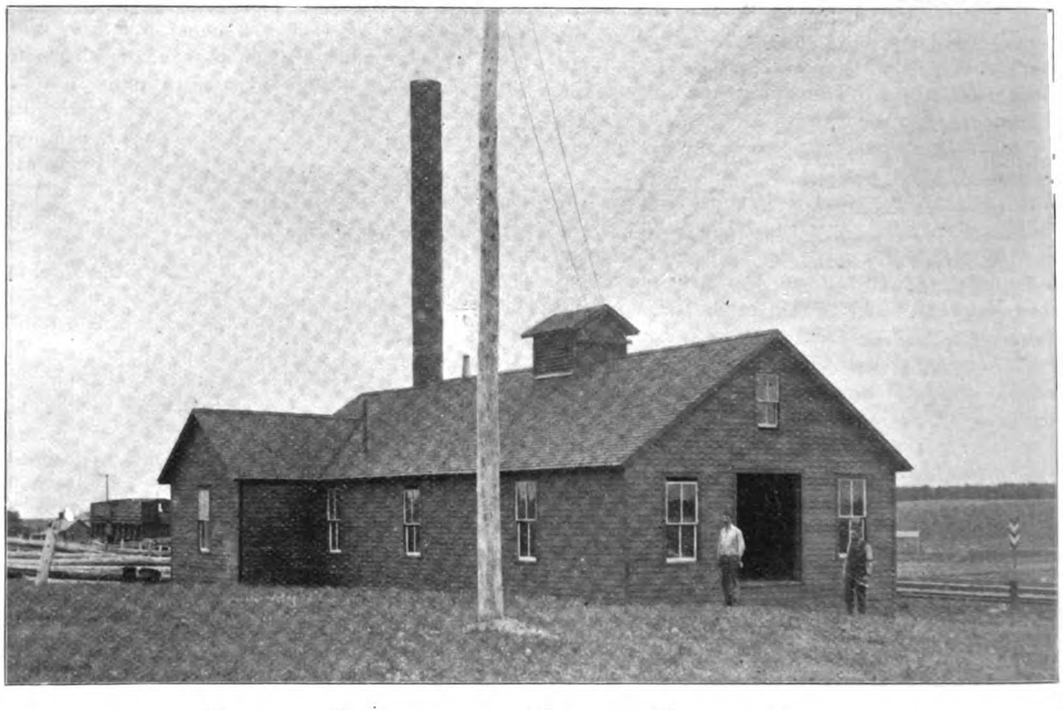
Tools and Fixtures:	
One Buffalo scale, capacity 3,500 lbs.	61.00
One combination vise	15.00
One 5-foot crowbar	1.85
One 3-foot crowbar	.95
Three round-nosed shovels, long handles	3.00
Three spoon shovels, long handles	1.50
Two scoop shovels	2.25
One coal pick	.75
One flue scraper	1.50
One steam flue blower	17.00
One " " damper	11.00
Four step ladders	6.00
Five pikepoles	3.00
One pair of come-along blocks	1.10
Two digging bars	3.00
One canthook	1.25
One pole support	2.50
One lantern	1.25
Fifty ft. 1 in. rubber hose and nozzle (hose $8, nozzle 65c.)	8.65
Fifty ft. 1½ in. rubber hose and nozzle (hose $12, nozzle $1)	13.00
One iron wheelbarrow	10.80
Two oil tanks 30 gals. and 25 gals	12.00
One oil filter, 3 gals	4.00
Three oil cans	.75
One cross-cut saw	1.75
One brace	2 00
One 3-16 in. bit	.40
Total	$18,051.86

Total brought forward	$18,051.86
One pair 8 in. side-cutting pliers	1.25
One meter sealing tool	5.00
Nine wrenches for engine, assorted sizes	12.00
Two steam radiators	25.00
One force pump and cylinder, two pieces of shafting, two iron pulleys, two wooden pulleys (belonging to old well pump)	75.00
36 arc globes	7.50
	$18,177.11
Add for freight, engineering services and other services, switchboard and extras	2,500.00
Total	$20,677.11

In this schedule there is one A 70 alternator, No. 617, with a capacity of 1,300 incandescent lights. This 1,300 light A. C. machine had been installed some little time preceding the breaking down of the plant in anticipation of a boom in the lighting business in the town, and on just what basis such a boom was predicted in a town of such size it would be difficult to say. We are however informed on good authority that the number of lights in use never exceeded 600. The appearance and general condition of the enlarged station of the Mitchell Electric Company can be appreciated fully from the accompanying illustration. The arrangement of the plant also in this enlarged station is shown in the photographic reproduction of the official plan.



ENLARGED STATION OF THE MITCHELL ELECTRIC COMPANY.

We also print a copy of the official Trial Balance of the Mitchell Electric Company for the twelve months ending April 30, 1894:

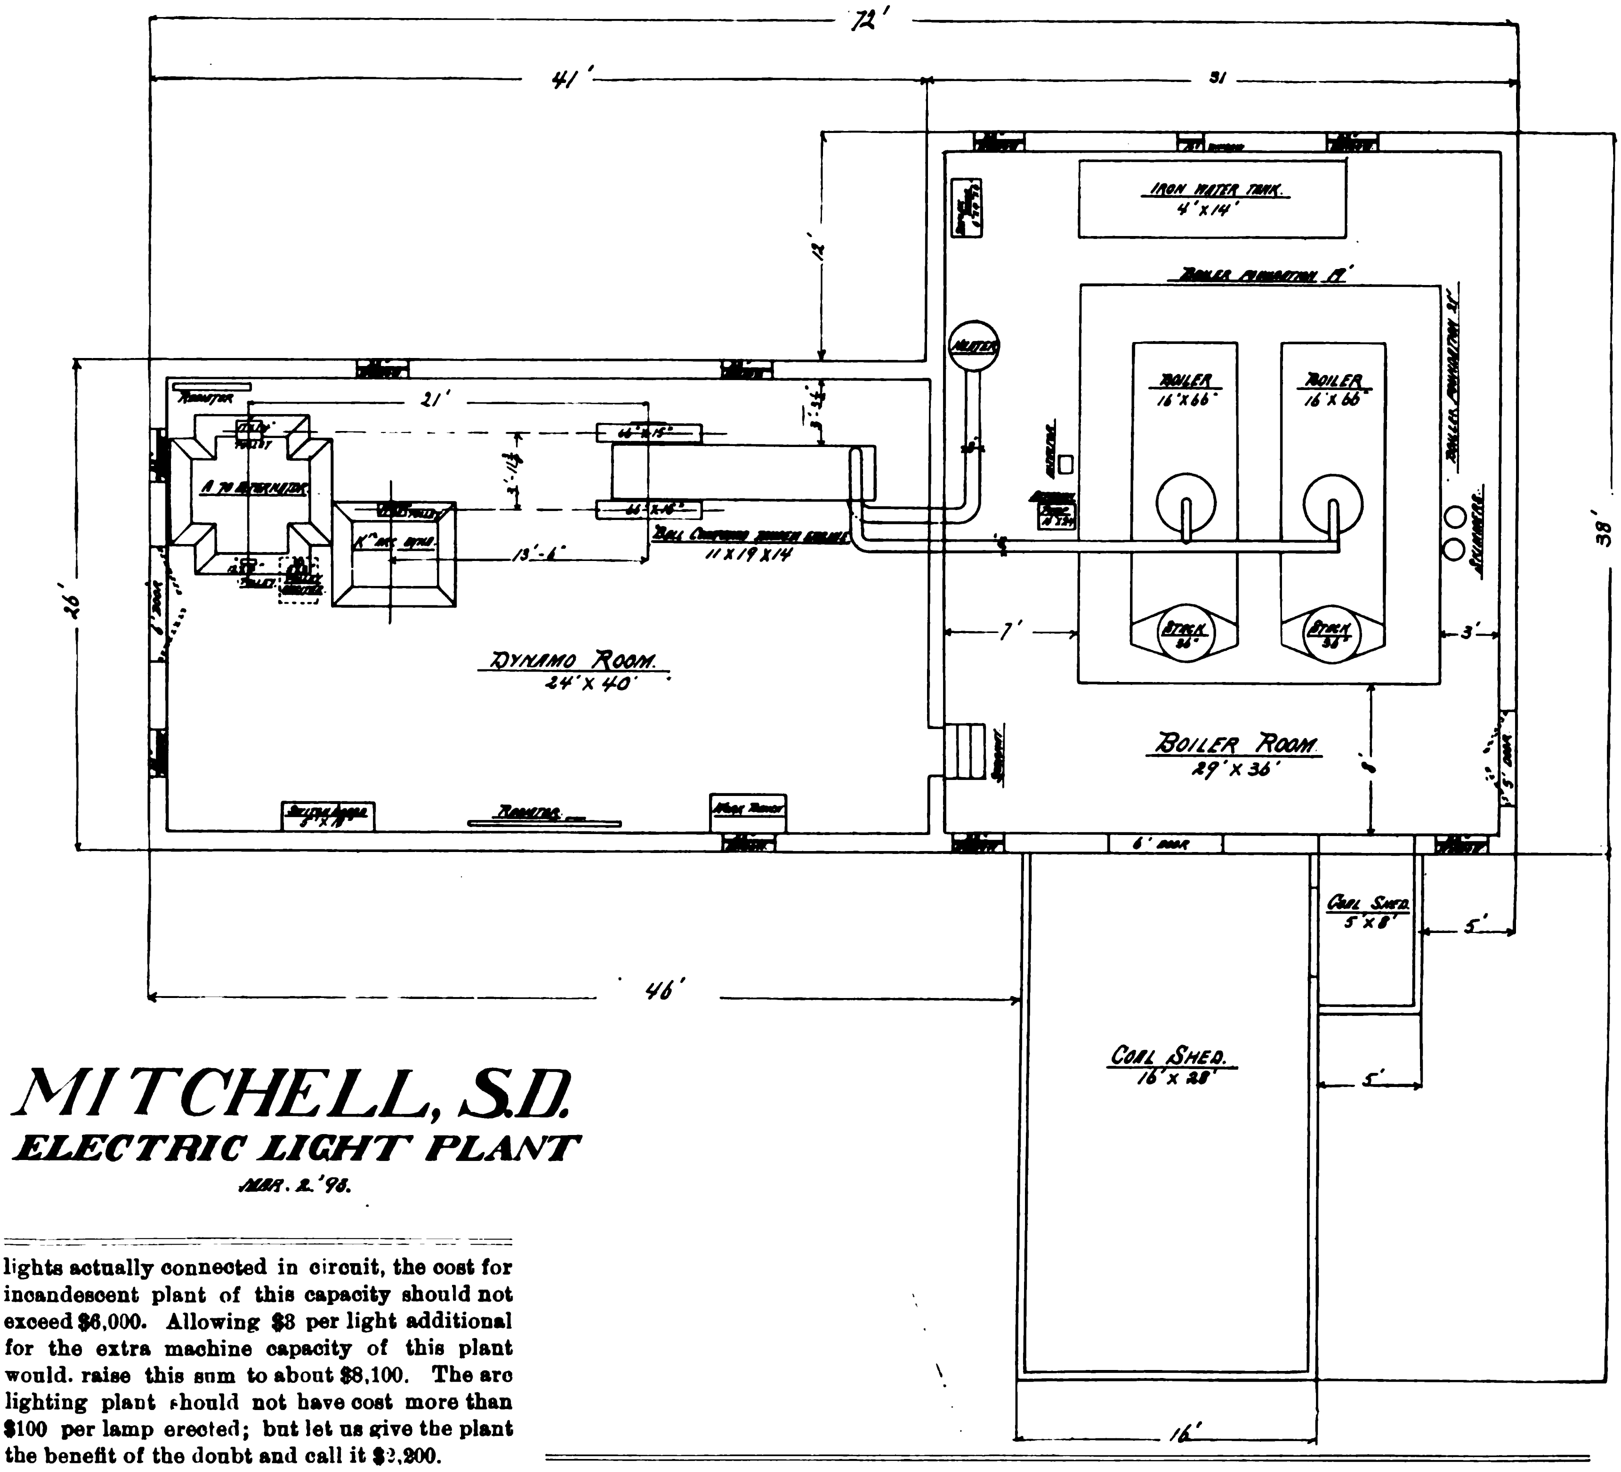
Treasurer Davison County	365.29	
		$47,581.84

We desire particularly to call the attention of our readers to the item of "Plant Account, $44,100.73," that they may compare this amount with the valuation given by us in the schedule of property of $20,677.11. Every one familiar with these matters will admit that our valuations have been in error, if at all, on the side of liberality. We see therefore that the plant of the Mitchell Electric Co. carried on the books at $44,100.73, could not have cost over $20,677.11, leaving a discrepancy between book value and actual value of $23,423.62.



MITCHELL, S.D.
ELECTRIC LIGHT PLANT
MAR. 2. '93.

As we have previously stated, the average cost of erecting an alternating incandescent plant was about $10 per light, and as there were only 600 lights actually connected in circuit, the cost for incandescent plant of this capacity should not exceed $6,000. Allowing $8 per light additional for the extra machine capacity of this plant would raise this sum to about $8,100. The arc lighting plant should not have cost more than $100 per lamp erected; but let us give the plant the benefit of the doubt and call it $2,200.

If to this be added $45 per H. P. for steam plant erected, and size of plant be stated as 200 H. P., this would make $9,000. With an addition of say $1,700 for station building and land, the entire maximum cost of such a plant should not exceed $21,000.

It is absolutely certain that there could be no legitimate charges on the books of the Northwest General Electric Company which could swell the sum of the investment to $44,100.73, and such charges as bring the plant account to that figure must have been made up of all the costs of the various changes which took place, and, possibly, of all the losses which had been incurred in the operation of the plant up to that time. We defy anyone in the electrical business to justify any such charges against a plant of this magnitude, and we consider this a striking example of electrical bookkeeping as practised by some of the concerns in this country and as distinct and positive evidence of an effort to swell the assets of the Northwest General Electric Company far beyond the bounds of honesty, and for the purpose of misleading stockholders of that company. We claim, and we believe justly, that the charges against this plant are absolute proof of the fact that the book values of these plants were totally different from the actual values—the actual values being, as a matter of fact, vastly less.

We have shown with sufficient clearness, we think, in the earlier part of this article that there was no reason to hope for success for any electric lighting plant in the town of Mitchell. We have shown from the official records the failure of the plant, as at first installed, to pay its way, its remodelling, capitalization, etc., by successive steps. Now let us trace the progress of the plant in one special particular. From the various official trial balance sheets in our possession, we show herewith what the debts of the concern were at different periods from February, 1893, to April, 1894, as follows:

Date of trial balance.	Notes and floating debt.
February 28, 1893	$18,193.43
March 31, 1893	18,296.62
May 31, 1893	18,308.29
June 30, 1893	18,318.27
July 31, 1893	18,571.72
April 30, 1894	14,425.06

The indebtedness thus appearing in the accounts of the "Mitchell Electric Company" was made up partly of charges for machinery, apparatus and supplies furnished and of money advanced to make changes in or pay for additions to the plant and for money advanced to meet the deficiencies resulting from its operation. When the charges for these items accumulated to a sufficient extent, the "Mitchell Electric" or other "Company" was called upon to pay up, and this was done by the officers of the "Company" making notes for the amounts, which notes were made payable to the Northwest Thomson-Houston Company or the Northwest General Electric Company, and were discounted at various banks, or by individuals, and the interest, or the difference between the face value of the notes and the money actually received for them, was again charged to the plants. In this way the Northwest Company was, in reality, making and discounting its own paper under the guise of other concerns, and charging as an asset on its books the losses incurred in the operation. This may be designated as "scientific skinning" of a most advanced character. Properly speaking it was fraud, and nothing but the vilest kind of fraud at the best.

Thus, month by month, the floating debt of the "Mitchell Electric Company" steadily increased, and the increasing burden of debt was made to appear as an asset on the books of the Northwest Thomson-Houston Company and the Northwest General Electric Company.

In January, 1891, Mr. Robertson stated that the investment in the original grist-mill plant was about $12,000, but the official trial balances of the Mitchell Electric Company show that, step by step, the "investment" apparently increased to nearly four times that sum, and with each increase in the expenditures on the plant there was a corresponding swelling of the *apparent* "assets" of the Northwest Thomson-Houston Company or the Northwest General Electric Company.

We think it is obvious that in this Mitchell electric plant there was at no time a *bona fide* sale of any of the machinery, apparatus and supplies used in its erection and operation; but it is a fact that there was a fictitious expansion of the volume of business done by the Northwest sub company and by the Thomson-Houston Electric Company and the General Electric Company, by the trickery resorted to in the exploiting of the scheme. We shall show conclusively that this was the general plan pursued all over the country by the management of the Thomson-Houston Electric Company and the General Electric Company, and was in fact the one which Mr. Coffin, in his 1894 report to the stockholders of the General Electric Company, referred to in the following language: "The Thomson-Houston Electric Company (the organization of which was mainly adopted by your company) . . . had been in the habit of doing more or less exploiting work. . . . By the facilities which it had thus been able to afford to local enterprises, it was able to expand its business." But we shall also be able to show that a very large percentage of the assets, and particularly the items covered by the term "Notes and accounts receivable, $8,935,159.75." used in that report, were largely made up of just such transactions as were carried on in connection with the Mitchell plant.

We think that in presenting the facts relating to the Mitchell plant we have conclusively established—

1st. That the principal object of these "exploiters" was to install and operate plants without reference to questions of profitable investment, and mainly as a means of illegitimately expanding the business of the parent company, and to provide sources of revenue for that company by the sale of worthless stocks and bonds to confiding investors, for the further debauchery of the entire industry and the enrichment of a few insiders in the business.

2d. That it made no difference to these "exploiters" whether the property upon which the "Company" was founded and the stock and bonds were issued had been proved to be absolutely incapable of earning sufficient to meet the operating expenses and fixed charges—they still stood ready to, and did, capitalize it far beyond the equitable or actual investment, and were ready to dispose of the stocks and bonds, knowing that no interest could be paid on either.

3d. That up to the very last there appears to have been no qualms of conscience to disturb the concocters of this scheme or to deter them from carrying it to the uttermost limits.

4th. That while the actual amount of money involved in the transactions connected with this Mitchell scheme was very much smaller than was involved in the railroad swindles in the same territory, there was no substantial difference in the methods employed, nor was there any less depravity.

5th. That in Mr. H. M. Byllesby, Mr. Coffin had found a willing tool, capable of descending to the necessary depth of business depravity, to carry on the nefarious transactions in connection with the founding of the Mitchell Electric Company and the subsequent conduct of its affairs.

6th. That every assertion made in our introductory chapter, relating to the method pursued in forming local companies, is substantiated by the proof we have presented from the official documents printed in the series of articles on this Mitchell plant.

This is the system, manufacturers and honest workers in the electrical trade, which has resulted in the almost complete debauchery and ruin of the electrical industry, the almost entire abolition of legitimate profit, the loss of millions of invested capital, the destruction of confidence in worthy electrical enterprises, and the debasement of the manhood of many of the workers in the trade.

It is against this system that ELECTRICITY enters its most vigorous protest; and it is against this system that we will wage a relentless and most merciless warfare until it is forever wiped out of existence and those responsible for its inauguration and continuance are driven out of the business.

Thus we close the record of another one of the financiering schemes carried out under the auspices of Mr. C. A. Coffin, president of the General Electric Company, by Mr. Henry M. Byllesby, president of the Northwest General Electric Company, by which it was intended to fleece Eastern investors by unloading on them $30,000 or $35,000 of securities on a plant the actual net value of which decreased every month after it was first installed, the installation of which could never have been thought of by any one except as the basis for a fraud.

And this is the "system" inaugurated by Mr. C. A. Coffin to kill off all competitors, to enable him to control the entire electrical business of America, and which convinced Mr. J. Pierpont Morgan that he (Coffin) was the man to place in charge of the General Electric Company.

(From the Philadelphia Press.)

GRAVE CHARGES OF BOND INFLATION.

Accusations Against Electrical Companies Made By a Trade Journal.

THE ARMOURS BRING SUIT.

Strange Financiering Described in an Action Brought By the Chicago Magnates, Who Claim That They Were Duped.

From the Regular Correspondent of Press.

New York, Aug. 27.—For some weeks past the trade journal ELECTRICITY has been publishing what in many respects are the most astounding and discreditable accusations ever made against any of those financiers who have been engaged in developing the so-called industrials. The accusations were aimed at some men in the management of a corporation whose career has been in some things one of mystery, and yet with which are associated some men who have the finest repute for business integrity. This is that great corporation created by the consolidation of the Thomson-Houston and the Edison Electric Company, and which is known as the General Electric. Its career since the consolidation has perhaps occasioned more comment than that of any of the other great combinations of capital which are legally corporations but in the public mind are regarded as trusts. Some of the industrial trusts were characterized by management which after bankruptcy was revealed to have been devoid of the ordinary principles of business integrity. But the management in these cases was in the hands of men who were esteemed business sharpers, ready to undertake any piece of financing, however immoral in its purpose, which the lawyers declared was within the strict letter of the law.

But a corporation with which Mr. Pierpont Morgan and D. O. Mills and H. McK. Twombley were associated was naturally regarded as one whose management would not be characterized by those evil things which have caused so much public condemnation for trusts and monopolies. Therefore the accusations made by ELECTRICITY are all the more astounding, since if they are not true they constitute the grossest kind of legal libel, whereas if they are true they reveal a policy which in spirit, if not in law, does not differ very greatly from that of the burglar or highwayman. These charges have attracted a very great deal of attention in business circles, but it is probable that public attention would not have been directed to them had it not been for the litigation begun by Philip and J. O. Armour with one of the greater guarantee companies of New York as defendant. The Armours intimate that they were grossly duped into investing money in a railway and motor company established in the city of Tacoma in the State of Washington. As these men are known as determined fighters, ready to spend any amount of money that may be necessary to defend their rights, it was clear as soon as the litigation was made public that a fierce legal contest had been begun.

The Armours in their complaint against the New York Guaranty and Indemnity Company in the Tacoma Railway case assert that certain bonds and mortgages issued by the Tacoma Railway, and delivered by it to the Northwest Thomson-Houston Electric Company, are fraudulent and void, and at great length the complaint sets out the reasons for making this assertion.

SERIOUS CHARGES MADE.

Stripped of legal verbiage, it appears that the Armours became interested in the Tacoma company at a time when it was capitalized for $750,000. On this capitalization the president issued $1 5 0,000 in bonds, of which $1,350,000 were disposed of through the New York Guaranty and Indemnity Company. The Armours claim that they were innocent stockholders; that the bond issue was excessive and unwarranted, and that they were financed by means of a dummy syndicate. The Armours claim that in the deal resulting in the floating of these bonds there went a bonus of $910,000 in stock, and that the whole debt created exceeded the indebtedness permitted by the company's by-laws by more than $300,000, and that the whole transaction was a fraud against the laws of the State; that it was done collusively with the Thomson-Houston Company, and the entire frauds aggregated $746,000. ELECTRICITY goes further than the Armours, printing detailed statements of the condition of these properties, and asserting that they were in no condition to warrant any financiering scheme, excepting a confession of bankruptcy and reorganization.

But according to these tables and statistics presented by this trade journal the Tacoma affair was not the only one characterized by methods which are not recognized as honorable or moral by business men who believe that integrity should be a part of their capital. For instance, the experience of what is called the Northwest General Electric Company, especially in its relation to the Winona City Electric Railway Company, is set forth in great detail, accompanied by the reports of the condition of that property. It seems that in the little town of Winona, Minn., there was a few years ago a lighting plant, a horse railway with four miles of track and an almost worthless equipment. It had never been successful, was barely able to struggle along, and it was capitalized for about $25,000. The electrical financiers saw in this little company a fine opportunity for a piece of financing which might, not through legitimate returns but through the creation of something out of nothing, bring a fine profit to them. They got control of this little street railway, paying, it is alleged, about $25,000 for it. Immediately after, the capital was increased to $100,000, and $100,000 in bonds were issued. There was not business enough in Winona to make it possible to earn a sufficient sum to pay dividends on the stock and interest upon the bonds. In fact, it is alleged that it was scarcely able to pay its operating expenses, but instead of confessing bankruptcy and getting out as well as possible, these electric financiers planned to consolidate the little lighting plant and the street railway, and upon that consolidation to issue more bonds and sell them in Boston. This was done about three years ago. The inventory of the Winona Railroad Company at that time showed that its entire plant, exclusive of the franchise was worth only $83,000. The company had no power-house, buying its power and from so shrewd a company that it was compelled to pay cash weekly. It had only four miles of track, and its entire equipment of cars was seven; yet the expert accountants who examined the figures of the reports claimed that instead of any further financing the railway company should have been thrown into the hands of a receiver, since a condensed balance sheet made it appear that the capital was impaired about $34,000. Yet when the Winona General Electric Company was floated, its investment account was reported as being $288,000 in round numbers, of which $19 ,000 represented the railroad company, $60,000 improvements, and $35,000 the sum paid for the electric light company. Upon this foundation, Electricity says, with no other basis than two worthless companies, $500,000 of stock was issued and $400,000 of bonds were planned to be sold in Boston. The experts reported that the lighting company had no chance of making any money and that the railway company would have been turned over to the courts if the Northwest General Electric Company had not lent it money to meet the interest upon its bonds and notes while the financing of a larger issue was under way.

It is claimed by those who make these accusations that there was not the slightest hope that the properties could be improved by consolidation, and basing their figures upon Mr. E. E. Higgins's work upon street railway finances, it is claimed that in towns larger that Winona a capitalization of $12.50 per capita is the largest which good business interests permit. Upon that basis the Winona Company might perhaps have been capitalized for $225,000, or including the light company for $260,000; yet those who are called the Boston financiers planned to issue on that property $900,000 of obligations, or deducting $35,000 for the lighting company's share of the capitalization, there were $865,000 of securities on four miles of track, or $216,000 a mile, and on a road which never paid operating expenses; or, putting it another way, the accusation is made that $900,000 of securities were issued on a plant costing less than $300,000 and losing $30,000 a year.

FOR THE NEW ENGLAND MARKET.

The charge is specifically made that these and other securities are manufactured in this way for the New England market, it being found far more profitable to float bonds than to attend to the legitimate business of the electric company. The accusations are far more specific than it is possible to set forth in a brief report like this, which is intended only to call attention to these extraordinary charges which have been made in public print. Electricity says that it is little wonder that the Winona General Electric Company, unable to earn interest on its notes, confessed bankruptcy in less than two years after the great plan for raising the capitalization to $900,0 0 went into effect, and early in the present year it was placed in the hands of a receiver.

ANOTHER PIECE OF FINANCING.

The experience of the St. Cloud City Street Car Company is also cited as a shameless illustration of the business methods of some of these electrical financiers. St. Cloud City has only about 8,000 people. Its street railway was only four miles long, its equipment was of the cheapest sort. It had lost money every month of its existence, and although it had a nominal capital of $100,0 0, its owners were very glad to sell it for $16,000, not in cash, but in the bonds of a new enterprise. On reorganization $100,000 of stock and $125,000 in bonds were issued, or at the rate of $33,500 a mile, and that even when the company was hiring its power. The experts employed by those who are making these accusations, and who seem to have had access to the books of the corporation, reported that the total value of the property of the plant, leaving the franchise out, was only $32,0 0, so that the capitalization represented over 100 per cent. inflation. The earning capacity of this little railroad for ten months was very nearly $12,000, or a little more than $1,000 a month. Its expenses for the same time were $14,000, leaving a deficit of $2,000

Strangely enough, while the Winona system—Winona having a population of 18,000—was capitalized at $200,000, the St. Cloud system—St. Cloud having a population of 8,000—was capitalized at $225,000. The accusers say they have been unable to learn where the securities of this extraordinary enterprise were negotiated, but they are satisfied that some of them were negotiated somewhere, and perhaps they may be in the unsuspected possession of some investors in New England who will by and by view them in sorrow.

Only a few days ago an application was made in Minnesota for a receiver for this St. Cloud street car company which had defaulted the interest upon its bonds. Accusations were also made that by a similar system of financing the St. Paul and White Bear Railroad Company was made to yield handsomely for some one. "It was," says Electricity, "a veritable Colonel Sellers project, the scheme being to utilize a steam road, so that it would be possible to manufacture stocks and bonds, and float them after the methods described in the other cases."

Of course the financier who seems to be most severely attacked by these accusations is President Coffin, and it is his misfortune that his management of the great electric trust of which he is president has been such that business men of integrity do not rise up and defend him. There is, of course, recollection of the extraordinary success which attended the financing of the little Thomson-Houston Company. As a maker of bonds he has no equal. Jay Gould himself could not begin to compare with him. Electricity says "that in accordance with Mr. Coffin's methods every single railway property whose name appears upon the General Electric list was capitalized from 100 to 900 per cent. more than it should have been." There has always been some mystery about the reason which led Mr. Twombley and Mr. D. O. Mills to retire from the General Electric Company as directors. Their friends have said that notwithstanding their most strenuous efforts they were really unable to find out very much about the affairs of the company, and decided that they did not care to remain in association with a company whose management was so much a mystery for the directors. It has been one of the reports of the street for some time that one of the directors has no personal relations whatever with Mr. Coffin, and that there has been surprise expressed that Mr. Morgan should have remained in association with a man whose brilliancy as a financier is acknowledged, but of whom so many men of high character are speaking as they do.

The impression is, however, that Mr. Coffin remains as president of the General Electric because it has been found impossible so far to fix upon any man who will take his place. These operations in the Northwest of which accusations are made only affect the General Electric Company indirectly because those Northwestern companies were only the creations of some of the individual members of the General Electric, and were thus allied in interest to it. It is charged, however, that these financial operations in the Far West and Northwest are very much like some of those which distinguished the development of the Thomson-Houston Company before it was consolidated with the Edison. Those developments, however, were almost wholly in New England, whereas after consolidation it was possible to have the whole country for a field.

These accusations are reported at some length because they have now become a matter of a good deal of public interest, and because while they remain unanswered the impression is certainly increasing that there must have been foundation for them. Holland.

Electrical Work in Japan.

Japan has been quick to take advantage of electrical applications in her mining industries. Although the cheap labor is rather an obstacle to the installation of power plants, they are making headway, and, judging by the figures recently given out of the value of Japan's electrical imports, this country is gaining the business very rapidly. According to a German authority, the value of dynamos exported from Germany to Japan in 1892 was 73,741 yen, which far exceeded that from Great Britain or the United States; in 1894, however, those imported from Germany amounted to 18,120 yen, from England 49,222 yen, and those from the United States 145,200 yen.

THE PROPOSED MAGNETIC UNITS.

In view of the interest attaching to the proposed magnetic units and the nomenclature involved, as well as the stand which Electricity alone of all American electrical papers has taken, we reproduce herewith matter which has recently appeared on the subject in the columns of our esteemed English contemporary, the London *Electrician:*

Magnetic Units.

At the Oxford (1894) meeting of the British Association, Prof. Oliver Lodge, at the request of the Electrical Standards Committee, undertook to draft for future discussion a paper on Magnetic Units. This paper has been circulated among the members of this committee, and with a view of obtaining opinions on this subject from those who are not members we have been desired to give space to Prof. Lodge's paper in the columns of the *Electrician*.

Believing that the committee is impressed with the convenience of affixing names to some of the more important units connected with the magnetic circuit, I beg to suggest the following considerations and recommendations, which I will write out as briefly as possible. The statements are intended to be precise in their terms; but in several cases alternative forms of definition are given.

1. That the unit coefficient of self-induction, though frequently useful, is by no means one of the most fundamental units, but should be defined in a suitably subordinate manner with reference to other and more important quantities.

2. That it would be a mistake so to define it as to discourage the employment of the same term for as many other quantities of the same "dimensions" as possible, especially for the unit coefficient of mutual induction and for unit "permeance."

3. That the essentially different quantities commonly called H and B should be carefully kept distinct, although their measures in air have been conventionally so arranged as to be numerically equal.

[*Summary of known facts and definitions.*—H being the intensity of magnetic force at a point, or the slope of magnetic potential (ω),

$$\omega_a - \omega_b = \int_a^b H\,ds, \text{ along any length } ab;$$

and in a closed magnetic circuit the circuitation of H is equal to 4π times the total electric current through the area bounded by the magnetic circuit; or,

$$\text{cycle} \int H\,ds = \text{circuitation of } H = \iint 4\pi\,c\,dS = 4\pi C,$$

or, at any point of space,

$$\text{curl } H = V \wedge H = 4\pi c,$$

where c is current density.

If the electric circuit consists of n turns of wire threading the magnetic circuit, and each conveying the current C_1, then $C = nC_1$.]

FIRST QUANTITY TO BE NAMED.

4. The first thing requiring a name is this quantity *magnetic potential*, sometimes called *magneto-motive force*, a quantity spoken of and measured, not inconveniently but with insufficient generality, by electrical engineers as ampere-turns. It has been proposed (by Mr. Heaviside, for instance,) that it be called *gaussage*, and that its C.G.S. unit be one *gauss*.

5. The circuital gaussage round a closed curve is 4π times the total electric current through the area bounded by that curve.

In the case of a magnetic circuit wound with wire the gaussage is $1\frac{1}{4}$ times $\left(\frac{4\pi}{10} \text{ or } 1{\cdot}2566\right)$ the ampere-turns threading that circuit.

Note.—It *may* be best to retain the word "gaussage" for the whole of a closed circuit only, and to speak of the difference of magnetic potential between two points as the fall of gausses or the "gauss-fall" from a to b.

6. The gaussage, or gauss-fall, in any portion ab of a magnetic circuit, is measured by the change in the potential energy of a unit pole as it moves from a to b by any path which involves neither the cutting of magnetic layers nor the

encircling of currents (a long channel being imagined for its motion through solid material if necessary). Or, more practically, it is measured by the induction through a long narrow tube whose ends are at *a* and *b* respectively, divided by the permeance of that tube. (*Cf.* Chattock on a magnetic potentiometer, *Phil. Mag.*, July, 1887.)

In practice, however, gaussage is frequently calculable from the ampere-turns to which it is due.

7. Intensity of magnetic force, or H, will be naturally expressed as gauss-fall per centimeter, or the *gauss-gradient.* For instance, the earth's horizontal intensity at some place is 0·18 gauss per linear centimeter, or 5·4 gausses per foot.

Note.—H should not (strictly speaking) be expressed as so many lines per square centimeter; that mode of expression should be reserved for induction-density B. H is the cause, and should be thought of as the slope of magnetic potential, B is the effect. In a medium of so-called unit permeability the two quantities are numerically equal, but they should not be confounded, any more than the slope of electric potential, or electric-intensity (e) should be thought of as identical with current-density, even in a medium of unit conductivity.

8. The gauss-gradient inside a long or closed magnetic solenoid of length l, wound uniformly with n turns of wire each conveying the current C_1, is $4\pi n\, C_1 / l = 4\pi n_1\, C_1$, where n_1 is the total number of turns of wire (in all the layers) to the linear centimeter.

This is the measure of H in the interior of such a solenoid, quite irrespective of the material with which it may happen to be filled.

SECOND QUANTITY TO BE NAMED.

9. The second quantity requiring a name is the *total induction* in a magnetic circuit, also called "total flux," "total lines," "electromagnetic momentum," and "electrotonic state" It is the quantity whose time-rate of variation gives the voltage induced in an electric circuit surrounding it once. It is proposed that its practical unit be called a "weber," and be defined as equal to 10^8 C G.S lines (or unit tubes) of induction.

(Denote the quantity for the present by N, and its density by B.)

[*Summary of Known Facts.*—e being the intensity of electric force, or the slope of electric potential, or the volt-gradient at a point; the circuitation of e = the induced E.M.F. in a closed circuit = the rate of change of induction through it;

or, $$\text{cycle}\int e\, ds = \mathrm{E} = -\dot{\mathrm{N}} = -\iint \dot{\mathrm{B}}\, d\mathrm{S};$$

or, at any point of space,

$$\dot{\mathrm{B}} = -\operatorname{curl} e = -\mathrm{V} \triangle e.$$

Through a simple closed electric circuit of constant resistance,

$$\mathrm{N} = -\int \mathrm{E}\, dt = \int \mathrm{RC}\, dt = \mathrm{RQ}\ ]$$

10. The total induction through any area may be practically measured by suddenly surrounding it with a closed wire circuit of n turns connecting the terminals of a ballistic galvanometer, and measuring the quantity of electricity thereby impelled through the galvanometer. The induction is equal to the quantity so impelled, divided by n times the resistance of the circuit. If the quantity is 1 coulomb, and the resistance 1 ohm, the induction is $1/n$th of a weber.

Or, otherwise, if the induction through any boundary changes at the rate of 1 weber per second, the E.M.F. excited in that boundary is 1 volt.

In the case of a spiral wire circuit through which induction is varying at the rate of a weber per second, 1 volt is excited *in each turn* of the wire.

11. *Another* mode of measuring the total induction through an area is to surround that area with a movable electric circuit of n turns of wire conveying a known current, and to measure the potential (or mechanical) energy of the circuit under those conditions. The induction is equal to the potential energy of the circuit divided by n times the current circulating in each turn of wire.

Or, if the induction through a simple circuit carrying 1 ampere is 1 weber, the potential energy of the circuit is 1 joule.

DERIVED QUANTITIES.

12. Induction density, or B, may be expressed as so many webers per unit area—say per square centimeter or per square inch, or whatever is preferred for practical purposes.

For instance, the earth's horizontal induction density at some place is 0·18 C.G.S. unit = 0·18 $\times 10^8$ weber per square centimeter = 18 microwebers per square meter.

13. The inductivity (μ), or absolute permeability of a medium at any point under specified circumstances is the ratio of B to H at that point and under those circumstances. In many substances this ratio is far from constant. [It may be expressed in terms of henries or other units of permeance per unit length (see below), instead of in C.G.S. units, if convenient. For example, the inductivity of air is $\frac{1}{100}$th of a microhenry per centimeter, or one millihenry per kilometer.] More explicitly it is measured by the webers per unit area divided by the gauss-fall per unit length; in other words, by the ratio of the weber density to the gauss-gradient.

14. The relative inductivity of a substance as compared with that of empty space (μ / μ_0) may be called simply its "permeability" as at present, and is a mere number.

[Its electrical analogue is specific inductive capacity (K/K_0), as contrasted with absolute electric inductivity (K); which latter could be defined in practical units as the ratio of the coulombs displaced per unit area to the volt gradient]

THIRD QUANTITY TO BE NAMED.

The third quantity for whose unit a name is required is some form of ratio between the two fundamental quantities whose units are here named after Weber and Gauss respectively. It has been practically decided in America that this unit shall be named after Prof. Henry, of Washington, but the precise definition has not yet been agreed upon.

There are two quantities of the same physical dimensions to which the name is applicable, viz., the coefficient of self or mutual induction of a coil or coils of wire, and the permeance or inverse reluctance of a magnetic circuit.

The most logical order is to define permeance, first, as the ratio of the webers of induction to the exciting gaussage, and then to say that the inductance of a coil of n turns of wire is n^2 or $4\pi n^2$ or $0{\cdot}4\pi\, n^2$ times the permeance of the magnetic circuit which it embraces, according to the units of gaussage and current which have been decided on.

If the units of gaussage and current are both the C.G.S. units, then $4\pi\, n^2$ is the numerical factor connecting inductance with permeance.

If the C.G.S unit of gaussage is adopted along with the ampere current, then $4\pi\, n^2$ is the factor.

But if the circulation of H due to *one ampere-turn* is adopted as the practical unit of gaussage, then n^2 is the factor, and the permeance of a cylinder, instead of being simply $\frac{\mu \mathrm{A}}{l}$, is $\frac{4\pi\, \mu \mathrm{A}}{10 l}$.

The apparent simplicity of this last system has much to recommend it for commercial use, though it will complicate the specification not only of permeance but also of magnetic fields and potentials; but *some* inconvenience, due to the unfortunate definition of the unit pole and the only less unfortunate definition of the practical unit of current, cannot be avoided; and our aim must be to place the inconvenience where least likely to be felt in every day work.

FIRST SYSTEM.

We will begin with the more logical system, and with general statements which apply to both.

15. In a complete magnetic circuit the ratio of the total induction to the corresponding gaussage under specified conditions is called the "permeance" of that circuit under those conditions. It is not in general constant.

Or, the permeance of any solenoidal portion of a magnetic circuit, if free from intrinsic magnetomotive force or magnetic boundary layers, is the webers through it divided by the gausses between its ends.

16. The practical unit of permeance is that of a circuit in which a weber is excited by a gauss. Its reciprocal is the unit of reluctance. The practical unit so defined is 10^8 C.G.S. units.

Examples.—The permeance of a cubic meter of air to parallel induction from one face to the opposite is 1 microweber per gauss.

Under circumstances such that the permeability of iron is 400 times that of air, the permeance of an iron ring of one decimeter cross-section and one meter in mean diameter is $\frac{400\pi\, r^2}{2\pi \mathrm{R}} = 20\, r$ = 100 C.G.S. = again 1 microweber per gauss.

It is, perhaps, a question whether this amount of permeance could be called a "microhenry" without confusion.

[*Explanation.*—The inductance (or self-induction coefficient) of an electric circuit consisting of n turns of wire, so far as it is constant, is defined to be equal to n times the induction produced through it by a current of 1 ampere in each turn. But the gaussage due to n ampere-turns is $\frac{4\pi n}{10}$ or $0{\cdot}4\pi\, n$; hence the inductance of a wire coil is $0{\cdot}4\pi\, n^2$ times the webers caused by each gauss in the magnetic circuit surrounded by it; *i.e.*, is $0{\cdot}4\pi\, n^2$ times the permeance of that circuit considered as constant.]

17. A coil of wire threading n times a complete magnetic circuit of unit permeance under any given circumstances is said to have $0{\cdot}4\pi\, n^2$ units of inductance under those circumstances; and in general the inductance of a coil of n turns is $0{\cdot}4\pi$ n^2 times the permeance (as above defined) of the magnetic solenoid enclosed by it. (The permeance may here be considered variable.)

[With the ampere-turn as unit gaussage the $0{\cdot}4\pi$ is prefixed similarly to both inductance and permeance, so that only the factor n^2 is needed to convert one into the other. See below.]

18. The C.G.S. unit of inductance is equal to n times the induction excited through a coil per C.G.S. unit of current in every turn of wire; whereas the practical unit of inductance is n times the webers excited per ampere; hence the practical unit of inductance is 10^9 times the C.G.S. unit.

The practical unit is called a "henry." (It has also been called secohm and quadrant.)

Example.—If the above iron ring were wound closely with 1,000 turns of wire, the coil would have a coefficient of self-induction equal to $\frac{4\pi}{10}$ or $1\tfrac{1}{4}$ henries whenever the permeability of the iron was 400.

A coil of 20,000 turns of wire, wound closely on the same core, would have an inductance of $1\tfrac{1}{4}$ henries if it contained air or other non-magnetic substance.

ALTERNATIVE MODE OF DEFINITION OF INDUCTANCE ON FIRST SYSTEM.

In view of one of the above practical methods of measuring induction experimentally, the inductance of coils of wire, both self and mutual, may be defined more directly thus:

19. When of two simple circuits one conveys a current, the other in general has induction caused through it, and the ratio of the induction through either to the inducing current in the other is called the mutual inductance of the circuits.

20. Of two coils, with n n' turns respectively, the total mutual inductance is to be reckoned for every turn of wire on each coil, and is therefore $n\, n'$ times the inductance of the mean turn of one coil on the mean turn of the other.

21. The mutual inductance of two coils is 4π $n\, n'$ times the permeance of the largest magnetic solenoid which threads both. For if every turn of one conveys a current C, while every turn of the other surrounds an induction N′ in consequence, the permeance of the magnetic solenoid threading the second coil is $\mathrm{P} = \mathrm{N}' / 4\pi\, n\, \mathrm{C}$; but the total effective mutual induction, M C, through all the turns is $n'\, \mathrm{N}'$; hence $\mathrm{M} = 4\pi\, n\, n'\, \mathrm{P}$.

22. When two coils each conveying one ampere are constantly connected by one henry of mutual inductance, the kinetic energy of the field due to their mutual action is one joule.

23. If the *self*-induction coefficient of a coil is being considered, its total inductance may be taken as n^2 times the inductance of the mean turn; that is n times the total induction through it divided by the inducing current. Or the weber-turns per ampere give the self-inductance in henries.

24. The practical unit of inductance, whether self or mutual, is called a henry; and a coil of n turns has a henry of inductance, on itself or on another of n' turns, when an ampere in one maintains $1/n'$ weber of induction (through itself or) through the other.

25. When the induction through a coil varies for any reason at the rate of one weber per second, the E. M. F. generated in each turn is one volt.

26. When the inductance of a coil is one henry, on itself or on another, a small variation of current in it at the rate of one ampere per second induces an E. M. F. of one volt in itself or in the other.

27. When the inductance of a coil conveying one ampere varies at the rate of a henry per second, the induced E. M. F. is one volt.

28. When the self-inductance of a coil is constantly, or on the average, one henry, while an ampere current is generated in it, the kinetic energy of the field due to that ampere is half a joule.

SECOND SYSTEM.

29. If instead of taking a gauss as equal to a C. G. S. unit of magnetic potential, we take the *circulation* of H caused by one ampere-turn as the practical unit of magneto-motive force, we *shall* have 1 ampere-turn $= \frac{10}{4\pi}$ C. G. S. units of gaussage.

30. The practical unit of permeance will then *be that* in which a weber of total induction is excited by each ampere-turn; in other words, it will be $4\pi \times 10^7$ C. G. S. units of permeance.

31. And the practical unit of inductance will be that of a coil in which an ampere in every turn excites $\frac{1}{n}$th of a weber through every turn; that is to say, the inductance of a coil will be n^2 times the permeance of the magnetic circuit surrounded by it.

32. The difference between inductance and permeance is only one of reckoning. Permeance is webers per ampere-turn. Inductance is weber-turns per ampere.

SUMMARY OF THE ADVANTAGES OF THIS SORT OF MODE OF DEFINING UNIT INDUCTANCE.

The special feature of this mode of defining the "henry" is that it makes inductance depend on the simple ratio N/C, or weber-turns per ampere, instead of on something more complicated.

It might possibly be defined as the ratio dN/dC, that is, as proportional to the tangent of the slope of the B : H curve; and such a definition would emphasize its variability; but certain practical advantages would be lacking, because it would be detached from any connection with the *permeance* of the circuit. The N/C ratio on the other hand instantly connects itself with permeance, and represents the slope of the secant drawn from the origin to any point of the B : H curve. It exhibits the variability sufficiently, making the inductance reach a maximum at the shoulder of the curve, and then slowly decrease as saturation sets in.

It is sometimes said—but the mode of expression is, to say the least, very inconvenient—that there are three different principles on which to define L, all leading to a different result, viz., numbering them inversely but giving them in their usual order:

(3) Energy .... $W = \frac{1}{2} L C^2$,
(2) E. M. F. .... $E = L\, dC/dt$,
(1) Total induction $N = L C$.

But the real facts to be expressed are not here exhibited. The real facts are

$$(1)\ N = LC,$$
$$(2)\ E = dN/dt,$$
$$(3)\ dW = C\,dN.$$

The essential thing to name is, therefore, N; and if 10^8 C. G. S. lines or unit tubes be called a "weber," or a "weber-turn," then a volt is a weber or a weber-turn per second, and a joule is a weber-ampere-turn. Nothing can be handier than that; and a henry can be defined as a weber-turn per ampere.

Instead of saying, as above, that there are three ways of defining L, the simplest thing is to say that two of the three equations as first given above are incorrect, except for the special and, in practice, comparatively rare cases when L is constant. Written out correctly they stand as follows:

$$(1)\ N = L C,$$
$$(2)\ E = L \frac{dC}{dt} + C \frac{dL}{dt},$$
$$(3)\ W = \tfrac{1}{2} L C^2 + \tfrac{1}{2} \int_0^C C^2\, dL.$$

It is then obvious that (2) and (3) are too complicated to base a definition upon, and that the first alone gives a feasible system.

The fact that L is decidedly not in general constant deprives the henry of any such importance as the ohm possesses; moreover it refers explicitly to rather a special thing, viz., a coil of wire, and that under specified conditions if it contain iron; hence it would be rather absurd to name this alone of all magnetic units. In the above communication, in addition to a certain mode of defining the henry, it is urged that unit total induction be named too; for this is the quantity which is of real engineering importance—this is the quantity to attain which field-magnets are built and in the midst of which armatures are spun.

It is also urged that it would be convenient if unit magnetic potential could likewise be named, since electrical engineers have shown that they have need of some such unit for the exciting cause of induction by their practical employment of the phrase "ampere turns." The introduction of a gauss unit, in some form not too obviously limited to the case of a wire-wound coil, would assist teaching and would clarify magnetic ideas.

The present writer does not presume to decide between the two alternative systems of defining "the gauss" as given above: viz., the C. G. S. unit on the one hand and the ampere-turn on the other.

APPENDIX 1.

It need hardly be said that in the last resort it rests with practical men to employ or decline any suggested system of units. Those who daily deal with the quantities under consideration are the best judges of the utility or otherwise of a suggested unit, provided always that they take the trouble to give it a fair trial, and see how it works in practice. It may be hoped that the above or similar suggestions will meet with criticism at the hands of such men, and in order to make a beginning of criticism I asked the Departmental Lecturer on Electrotechnics at University College, Liverpool (Mr. F. G. Baily), to consider them with special reference to—

(1) The large size of the weber and henry units.

(2) The handiest definition of the gauss; and

(3) The least troublesome mode of bringing in the 4π.

His reply, which is annexed, covers these points, and also incidentally refers to the quantity called I or intensity of magnetization.

Now, as must often have been pointed out, the equation $B = H + 4\pi I$ is a barbarous one, involving as it does quantities of different dimensions in one equation. Its true meaning is, of course, $B = \mu_0 H + (\mu - \mu_0) H$; which, although algebraically only a roundabout method of writing $B = \mu H$, is yet convenient, as exhibiting separately the part of the induction due to the ether and the part due to a material medium.

The customary convention of further denoting $(\mu - \mu_0)/\mu_0$ by the symbol $4\pi\,\varkappa$ (or $\varkappa$), and then christening $H\varkappa$ as the magnetization I, is likewise convenient. With this definition $\varkappa$ is a pure number, and I is a gauss-gradient or field-intensity. Another, but on the whole less satisfactory, definition, viz., the omission of μ_0 from the denominator, would make $\varkappa$ of the same dimension as μ, and I an induction-density.

The pull between two parallel magnetized surfaces of area A is $\frac{1}{2} A B H \div 4\pi$, that is to say, $NH/8\pi$, and is therefore measured in webers multiplied by the gauss-gradient, or in joules per centimeter. But to maintain an induction density B in air requires a gauss-gradient B/μ_0, hence we might write the pull across an air-gap as $N^2 \div 8\pi\mu_0 A$. If the induction-density across an air-gap is expressed in microwebers per square centimeter the tension there comes out in units of which 2,500 would make an atmosphere; or, roughly, in pounds per square foot.

As for the strength of a magnetic pole—a quantity which, though fundamental in one sense, is seldom really dealt with—it will naturally be expressed in ergs per gauss, or in joules per gauss if it is very strong.

Mr. Baily's chief practical suggestions are first that a special unit of permeance other than the henry is desirable; and next that the $4\pi/10$ had best be thrown on to the μ, so to keep the gauss equal to one ampere-turn. The fact that the inductivity of air will then cease to appear in its artificial garb of unity may even be regarded as a positive advantage, because its existence will then be less likely to be ignored. But I much fear that the ampere-turn as unit of gaussage, so near the C. G. S. unit in size and yet not equal to it, will be awkward and may lead to mistakes.

O. J. L.

(*To be continued.*)

Electricity is making progress in South Africa, as evidenced by the rapidly increasing mining plants being put in operation there. The Electric Construction Company, Limited, of London, has supplied a plant for the City and Suburban Mine, and three dynamos for the New Crœsus Gold Mining Company, near Johannesburg. The same company has equipped the New Comet Mine with an electric lighting plant, and the Wemmer Mine is also installing electric lights.

Interesting Effect Observed With the Voltaic Arc.*

Two Brianne arc lamps were installed at Havre in front of a jewelry establishment in order to light up, at the same time, both the clock and the interior, and they were to be fed by the alternating current furnished by the central station of the "Havre Electrical Energy Company."

This current had a mean electromotive force of 60 volts, and was derived from a transformer fed by a primary current of 2,400 volts.

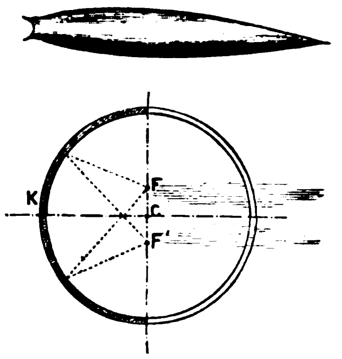
This difference of potential of 60 volts being too high to obtain a normal rate of working from a single lamp, and being besides too low for working two lamps in series, was reduced to 45 volts by the introduction of self-induction resistances on the secondary circuit, and the two lamps were connected in parallel.

Each absorbed 10 amperes when burning normally. The upper carbons of the lamp had a section of 14 millimeters and the lower carbons of 10 millimeters.

Lastly, these carbons were arranged in the center of a large globe of transparent glass, one-half of which had been silvered inside, so as to become converted into a *hemispherical reflector*.

The exterior of that part of the globe that formed the hemispherical reflector was covered with an opaque varnish, which completely hid the light on that side.

We have had to give all these preliminary details in order to facilitate the explanation of the curious phenomenon that we are about to describe.



FIGS. 1 AND 2.

When we made the first trial of these lamps in their reflecting globes, they worked at first very regularly, furnishing a satisfactory light for lighting the clock and the shop; but, after about half an hour, there was a sudden brief extinction of each of the two lamps, to which, at first, no great importance was attached.

But half an hour later another extinction occurred, followed, as before, by the immediate relighting of the lamps.

On examining the carbons, we were surprised to find that they were considerably reduced in length; it was evident that this abnormal combustion was far from being in proportion to the duration of working. The lamps were put out, and at the bottom of each globe were found two little spindles of graphite, about 4 centimeters long, pointed at one end and hollowed at the other. (Fig. 1.)

The presence of these spindles readily explained the cause of the apparently very rapid combustion of the carbons, and the successive extinctions of the arcs; but the cause of their formation seemed, at first, inexplicable.

In order to ascertain the cause of this curious phenomenon, the lamps were made to work again several times in succession, their voltage and amperage being modified; but after each fresh trial four fresh spindles of graphite, exactly similar to the first, were found.

---

* Albert Nodon in "L'Electricien."

On studying this phenomena more closely, we soon found out the cause of this abnormal combustion. In fact, the carbons occupied the center of a hemispherical reflector, K (Fig. 2), and at the moment of lighting the focus made by the axis was formed at a point, F, situated above the center, C, of the sphere.

A *corresponding focus* was then formed by reflection at F′, on the lower carbon.

The result of this was that the greater part of the luminous and calorific rays were concentrated at the point, F′, and that the luminous focus, F, did not give out more luminous intensity than if it had burned with a naked light. The heat concentrated on the lower carbon soon became so great that the carbon became red hot, and began to be consumed at this point. The section of the carbon was consequently lessened by this combustion, the heating produced by the passage of the current in this resisting part was added to that furnished by the secondary reflection, and soon the section was reduced to a single point of contact, through which the arc was formed. At this moment the spindle became detached, and fell to the bottom of the globe in an incandescent state.

After the extinction produced by the separation of the spindle from the principal carbon, the action of the regulator brought the carbons in contact again, and the arc was again formed; but this time the arc was formed at F′, at a point below the center, C, of the sphere. A corresponding focus was then formed at F, and soon a second spindle detached itself from this carbon and fell to the bottom of the globe by the side of the first.

When once the cause of this defective working of the lamps was known, it was easily remedied. In fact, the reflecting globes were abandoned, as they were found to have such a disastrous effect, and they were replaced by cylindrical reflectors with a parabolic section. The lamps were arranged so that the carbons occupied, with regard to the reflectors, an axis parallel to the generators of the cylinder, and passing through the focus of the parabola. As the luminous focus was variable, we thus arrived, by a simple method, at a system of lighting which was to all intents constant during the whole of the time that the lamps were in service.

The result of this alteration was a considerable increase in the light projected and the absolutely regular working of the lamps.

In conclusion, therefore, we will advise all those who wish to use a reflector for an arc light never to arrange the luminous focus at the geometrical center of a *spherical* reflector; but we may add that there would be no objection to placing this luminous focus at the optical focus of the reflector, i.e., at a distance from the top of the hemisphere equal to half the length of the radius of the sphere, so as to project the rays in a luminous sheaf to all intents cylindrical.

Advantages of Electric Light in Bad Air in Mining.

The results of some recent experiments of Dr. Haldane have been made public. They refer to the presence of black damp; he finds that when the percentage of oxygen has fallen to 17·64 a candle is extinguished; at 3·38 per cent. of carbonic acid gas, and 15·3 per cent. of oxygen his respiration began to deepen, and at 7.32 and 9·62 per cent. respectively there was violent panting; at 7 per cent of oxygen consciousness would probably have been lost. He thus shows that there is a wide margin between the point of the extinguishing of a lamp and the point of danger to life; a miner provided with an electric lamp could therefore penetrate with impunity or escape through atmosphere containing at least three times as much black damp as would extinguish a lamp and the difficulty of respiration would give ample warning if the electric lamp did not.

The Electropoise.—II.

Methods of the Promoters Abroad.

(From Science Siftings, London.)

Our readers will readily understand how cautiously and slowly we are compelled to proceed in the matter of these revelations. We not only have to make analyses, but we have likewise to survey a vast quantity of advertisement and other literature, to inquire into testimonials, and satisfy ourselves in other cases about the antecedents of the quacks themselves. Delays, therefore, are unavoidable where so much has to be attended to, and for this reason we are unable to continue our exposé in this issue, but we shall return to it next week, making further disclosures.

We revert for the moment to the "Electropoise" fraud, in order to publish a letter from Mr. T. E. Gatehouse, whom readers of *Science Siftings* already know as one of the able conductors of the *Electrical Review*. We mentioned in our last article that Bourne, the agent for the Electropoise Company, was granted an interview by us because he stated that he called at the suggestion of Mr. Gatehouse. He added, furthermore, something that we did not deem necessary to publish last week: he claimed to have favorably impressed Mr. Gatehouse with the magically curative properties of his quack toy.

We knew that a man of Mr. Gatehouse's scientific attainments could not have been hoodwinked by so specious a sham, but we imagined that our contemporary might have reserved his opinion until the opportunity arose to express it in his own columns, and sent Bourne away laboring under the delusion that the low cunning of President John N. Webb would turn that opinion into one of gilt edged significance for the Electropoise Company.

Mr. Gatehouse, however, did nothing of the kind, and we publish below the text of a letter we have received from him:

To the Editor of SCIENCE SIFTINGS:

SIR: I have just read your third article "Crusade against Quacks." I beg to say I did not suggest that Mr. Bourne should call upon you with the "Electropoise." He intended doing so, and wanted to know where to find you. I gave him the desired information, that is all, and prepared him for the reception he might expect at your hands by personally giving him a bit of my mind, in even stronger terms than you have employed in your well-timed article.

I need scarcely say that everything you assert I can thoroughly endorse, as I have myself examined the apparatus, and was only prevented from forestalling *Science Siftings* in its exposure of this fraud by my time having been too much occupied in connection with another matter which has recently occupied the attention of a London magistrate for nearly three months. Faithfully yours, T. E. GATEHOUSE.

P. S.—But why not devote an article to condemning the practice of society journals employing writers utterly devoid of even a smattering of scientific knowledge, to extol the curative virtues (?) of these barefaced frauds, and thereby securing lucrative advertisements as the reward for bringing such bogus appliances to the notice of poor suffering humanity.

The passage in the last sentence of the first paragraph of this letter stamps the man Bourne as being an impostor and a liar of only meaner caliber than those who employ him. We endeavored last week to spare this creature, since we regarded him as the weak and ingenuous tool of strong-minded schemers. We hesitate no longer, and, after the wilful way in which he has endeavored to deceive us, condemn him along with those whose myrmidon he is.

Mr. Gatehouse also falls foul of that hybrid knight or lady of the pen yclept "the society journalist." These individuals, male and female, run riot in paths that even experienced scientists fear to tread. The society paper of to-day will give a prescription for remedying anything from a pimple to paralysis, from aortitis to a cold. This is highly reprehensible on the part of these editors who encourage the practice, and we are sorry that people are found foolish enough to follow the advice given. We believe that women are the worst offenders in this direction—both as prescribers and swallowers of the prescriptions.

The testimonials of a lay newspaper are usually of the most unreliable nature when they appertain to any branch of science. Science is a specialty of those who have made it their study, and the public should only regard scientific opinions and advice when they are offered by papers whose staffs are manned with specialists qualified in the departments dealt with. We trust Mr. Gatehouse's strong hint with regard to the advertisement *douceur* will not be disregarded, and that "poor suffering humanity" *will* benefit accordingly.

Considerable stress has been laid in these articles upon the quack device termed "The Electropoise." The story of the Electropoise fraud forms in part the subject of our second article, and the whole of the third article in this series has been devoted to the same matter. We regard the Electropoise revelations as the crown of the arch in the exposé of modern quackery. English law would speedily transform "the finest class of gentlemen in the United States" (for such is the self-description of the proprietors of the Electropoise) into a covey of jail birds. The Electropoise is an impudent and cruel fraud, and its very active proprietors are unblushing knaves who have conceived the notion of flooding our newspapers with fraudulent advertisements and raiding the attenuated pockets of our afflicted poor.

Up to date, and out-quacking every quack in cunning, boldness and extravagance, and with an apparently inexhaustible treasury, the Electropoise Company, under the generalship of "President" John N. Webb, intend if possible to occupy a larger and maybe a more notorious place than the late President C. B. Harness, of Electropathic Belt fame. Possibly the fate of M'Conville may have some occult influence, and a *douceur* of five years' penal servitude to a quack may cause these enterprising "gentlemen" to abide long in the United States and hesitate ere commencing operations in this country as threatened.

This we will say, that there is every reason to fear an invasion of England by the Electropoise quacks. Undoubtedly advertisements in newspapers and their marvelous publications would result in very large sales. It is an admission which is made with reluctance. Hence the Electropoise programme should be stamped out, not merely scotched, to revive again when these articles may have passed from public observation.

Our readers will recollect that in the third article of the Crusade against Quacks, the Electropoise was thus described: "This fraudulent instrument bears everything on its surface save the contents of the cylinder; clearly the cord and webbing are pure negations. The cylinder has been broken and examined—its contents analyzed. It is loaded with plumbago mixed with sulphur. This combination has been chosen probably because it is one of the cheapest forms of ballast that could be poured into the cylinder when in liquid or molten form. Observe the language of the "Electropoise" charlatans, who thus describe their crude and impertinent imposition: "It consists of a cylinder, called a 'Polarizer,' filled with imperishable materials, combined, after *years of study and experiment*, to produce the best possible results."

In the same article was set forth the fact that five guineas was the price placed upon this device, which a well-known City of London fancy goods dealer stated that he would hesitate to sell for a shilling in his establishment. There also appeared in the same article the extraordinary letter of President Webb, one of its chief promoters, offering a bribe to *Science Siftings*.

LEGAL NOTES.

The American Loan & Trust Company has begun suit to foreclose its mortgage upon the Olympia, Wash., Light & Power Company which has defaulted in payment of interest.

Lloyd G. Kirkland has filed a bill in the Circuit Court at Chicago asking for a receiver for the Mutual Electric Light & Power Company of Englewood, in which he makes serious charges against ex Alderman James L. Francis, formerly of the City Council.

Receivers Bierbower and Hunt, acting for the Farmers' Loan & Trust Company of New York, bondholders of the Omaha Water Company, have filed a damage suit in the United States Court at Omaha, Neb., against the Omaha Street Railway Company for $250,000 for alleged damage done to the mains owned by the plaintiff by escaping electricity from the company's wires throughout the city.

Thomas Wallace, Jr., has begun suit against the Carpenter Electric Heating Manufacturing Company for $5,900 and interest, said to be due on merchandise delivered to defendants by the Ansonia Electric Company of Chicago.

The Siemens & Halske Company have brought another suit against the Metropolitan Elevated Railroad Company in Chicago, and have asked for an injunction.

General News.

What is Going on in the Electrical World.

Stowe, Vt.—There is talk among the town officials of getting electric lights for this village.

Los Angeles, Cal.—D. M. McGarry has applied for a franchise for an electric railway forming a belt line in this city.

Bloomfield, N. J.—Paul W. Schroeder, of New York City, has applied for a franchise for lighting this town with electric lights.

Flushing, L. I., N. Y.—A movement is being made here toward forming a company to supply electric light and power for the village.

Fresno, Cal.—The city trustees have guaranteed a franchise to the San Joaquin Electric Company to operate in this city for fifty years.

Oswego, N. Y.—The Oswego street railroad has been purchased by George N. Burt and George D. Hart, representing New York capitalists.

Atlanta, Ga.—A Mr. Baer, of Cincinnati, is considering the construction of an electric line about twenty miles long from Atlanta to Douglasville.

Rush City, Minn.—Dr. A. J. Stowe, L. W. Wadlow and C. F. Jackson have been granted an electric light franchise for 30 years by the city council.

Augusta, Wis.—The vote in the recent special election on the question of bonding this town in $1,200 to put in an electric lighting plant was 112 for, 85 against.

Allegan, Mich.—F. A. Makin, representing Eastern capitalists, has been looking over the ground for an electric railway from Allegan to Saugatuck.

Owosso, Mich.—Alexander Ralph, who recently purchased the Owosso and Corunna Street Railway, is making arrangements to fit the road with electricity.

Van Buren, Ark.—The city council has granted a fifteen-year franchise to H. J. Isbel, of Parsons, Kan., to establish an electric light and power plant.

New Brunswick, N J.—The county board of freeholders have given the Brunswick Traction Company permission to build a trolley road from this city to South River.

Utica, N. Y.—The building of the Belt Line railroad has done so much to increase the growth of the city that the people are urging the company to make further extensions.

Springfield, Mass.—The move for an electric light plant in West Springfield, to be owned and run by the town, is meeting with a good deal of favor by residents of that place.

Little Falls, N. Y.—The *Times* says that, notwithstanding the opposition of certain gentlemen in Richfield Springs, the electric road from Little Falls to that village will be built.

Lansing, Mich.—The Lansing Electric Street Railway system has been sold by the Continental Trust Company of New York to the syndicate which operates a similar system at Battle Creek.

Aurora, Ill.—The council has granted a franchise to the Aurora Edison Light Company, which proposes to purchase a site and erect a $40,000 plant. Dr. I. W. Pritchard is president of the company.

New Orleans, La.—The Chalmette Railway Company has been organized with a capital stock of $100,000. President, Henry T. Beauregard; vice-president, R. C. Ducros; secretary, J. D. Alexander.

Kingston, N. Y.—The New York syndicate who have purchased the Burhans pulp mill at Winchell's Falls, together with the water power and other property, will build an electric railway from the works to Brown's Station.

Binghamton, N. Y.—A company of capitalists has offered to pay $5,000 per mile for a franchise to construct and operate an electric railroad, twelve miles long, in competition with the Scranton Traction Company's roads.

Georgetown, D. C.—The Potomac Electric Light and Power Company of Georgetown has transferred its plant to O. G. Crosby, Charles A. Lieb and J. H. Miller, who represent the Georgetown and Tennallytown Electric Railroad Company and the G. E. Company.

Manchester, Conn.—The Connecticut stockholders in the Perkins Electric Lamp Company are endeavoring to buy the stock in the company owned by Boston men, and if they are successful the company will resume operations in the manufacture of incandescent lamps at the old factory in Manchester.

Springfield, Mo.—A movement is in progress to have an electric light tower built in the center of the square, so as to give better light to the business portion of the town. It is proposed to build a steel tower 80 feet in height and have four arc lights placed thereon. Plans and specifications are now being prepared.

Canton, Miss.—The board of aldermen of Canton have let the contract for putting in waterworks and electric light plant at the cost of $85,10 . The Southern Electric Supply Company, of New Orleans, secured the contract. The plant will be owned by the city.

Tonawanda, N. Y.—There now seems to be no doubt that the apparatus to test the application of electricity to canal navigation will be ready by the day set, Sept. 24. The Lamb trolley system is to be tried. The experiment will be made on the Erie canal at Black Rock.

Keene, N. H.—The directors of the Keene Electric Railway Company have authorized a committee of three to make a contract for the construction of an electric road in Keene. The route as planned will eventually embrace Keene, West Keene, Swanzey, Factory and Marlboro.

Cohasset, Mass—It is stated on excellent authority that the New York, New Haven and Hartford Railroad will at once commence to equip that portion of the road from here to Braintree, a distance of about 15 miles, for running by electricity in connection with the Nantasket Beach branch.

Charleston, S. C—One of the sections of the revised ordinances now before the city council provides for the appointment of a city electrician every two years beginning on the fourth Tuesday of October next. The mayor makes the appointment and it must be confirmed by the council. The salary is $1,200.

Detroit, Mich.—Contracts have been let for the grading, ballasting and ironing of the new electric road between Mt. Clemens and Marine City, to be built and operated by the Detroit and River St. Clair Railway Company. The line is 32 miles long, and runs through New Baltimore and Algonac.

Waukegan, Ill.—The building of a street railway system here to be run by electricity or compressed air is now assured. A liberal franchise has been granted C. E. Lo s, a well known railroad contractor, and he gives a $5,000 bond to have a line running south from the business center to the Washburn & Moen Works by January 1 next.

Escanaba, Mich.—The city of Escanaba is now in possession of the electric lighting plant, having closed the deal for its purchase for the consideration of $70,000. Mayor Gallup appointed as a board of lighting commissioners, Solomon Greenhoot, F. D. Mead and W. W. Oliver, to serve for one, two and three years in the order named.

Monroe, Mich.—The Toledo and Petersburg Electric Railroad Company is being organized to build an electric road between Petersburg, this county, and Toledo, O. The promoters are O. S. Bond, W. S. Coon, E. C. Coon and J. J. Simmons, all of Toledo; Willis Baldwin of Monroe, and John O. Zabel of Petersburg.

Benton Harbor, Mich.—An electric railway is to be built from Coloma to Paw Paw Lake. The franchise has been secured and work will commence at once. As soon as this is completed it will be continued to this city, a distance of fifteen miles. The road will be built for the passenger and fruit carrying traffic, and will be run only in the summer.

Brooklyn, N. Y.—The stockholders of the Municipal Electric Light Company have decided to increase the capital stock of the company from $ 00,000 to $1,000,000.—The Edison Electric Illuminating Company of Brooklyn reports gross earnings for August of $51,328, an increase of $21,076 as compared with the same month of last year, and net $ 6,948, an increase of $5,597.

Salem, Ore—It is stated that F. N. Derby, superintendent of the Capital Railway, has been assured of capital by an Eastern firm to build and equip the proposed electric railway between Salem and Portland. There is ample water-power for the generation of electricity between the two points, and Mr. Derby estimates that $750,000 will put the line in operation.

Portland, Ore.—The new electric road which is to be built to Hillsboro by the Portland & Western Railway Company will be 17 miles in length when completed, and will open up quite a large section of country for suburban settlement. The promoters of the enterprise are S. Z. Mitchell, Fred V. Holman and W. F. Nelson, and the amount of the capital stock of the company is $50,000.

Conneaut Lake, Pa.—Among the improvements that will be made here before another season opens up will be the lighting of the Exposition grounds and all the buildings at that place by electricity. A large electric fountain will be one of the attractions. President S. B. Dick of the P. S. and L. E. Railroad is making arrangements to run all their passenger cars between Meadville and the lake by electricity.

Andover, Mass.—A street railway company, composed of residents of Andover and Ballardvale, is being formed to construct a railway between Andover, Ballardvale, North Andover and North Reading, with a capital of $30,000. The directors named are William H. Jowell, Joseph M. Bradley, H. Bradford Lewis, Walter H. Coleman, John M. Cole, William Od ing and Howell F. Wilson.

Philadelphia.—It is stated that a movement is on foot in this city to form a company that has for its object the absorption of six of the principal local electric light plants, namely, the Edison, Powelton, Columbia, Suburban, Manufacturers' and Diamond. According to the plan proposed it is understood that the company is to be organized with $5,000,000 capital, to be divided equally into common and preferred stock, the latter to be subscribed for with the common stock as bonus.

Wooster, O.—The Wooster, Medina and Cleveland Electric Street Railway Company's recently elected directors are: Crosby Thompson, of Cleveland; R. M. McDowell and J. Andrews, of Medina; F. H. Hawley, of Leroy; Warden Wheeler, of Creston; C. V. Hard, W. J. Mullins, A. Cunningham, L. P. Ob iger and C. W. Ka ke, of Wooster. The directors state that active steps towards building the road will be taken at once.

Lowell, Mass.—The Bradbury Stone Storage Battery Company of this city has just consummated a deal with the Electric Storage Company of Philadelphia by which the stock of the Bradbury Stone Company is guaranteed a value above its par by the Philadelphia company, and the payments for the newly acquired property are to be made in annual installments, taking the

THE TELEPHONE WORLD.

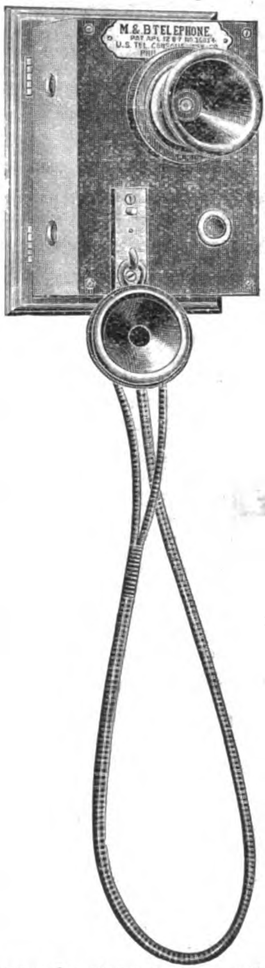
For Another Telephone Bill.

The fight for the passage of legislation intended to regulate the rates for telephone service in New York State will be renewed at the coming session of the Legislature. Several commercial organizations throughout the State have already taken action. The Pharmaceutical Association of Kings County has passed resolutions indorsing the members of the Legislature, at its last session, who voted for the Persons-Gerst bill and denouncing those who did not vote in its favor.

The Business Men's Association of Black Rock has adopted a resolution calling for a mass-meeting to be held October 1 for the purpose of considering the advisability of continuing the effort to have favorable telephone legislation enacted.

The M. & B. Telephone in a Philadelphia Club.

Since the United States Telephone Construction Company of Philadelphia has had the M. & B. Telephone on the market they have produced a variety of designs and instruments for interior use. The accompanying illustration shows one type, known as Style E, which is in use in the Manufacturers' Club, Philadelphia. This club has recently acquired property adjoining their club house and fitted it up into parlors and bachelors' apartments. There are 17 rooms, each of which is supplied with one of these Style E M. & B. Telephones. In the cashier's office down stairs there is a needle annunciator, manufactured by the Partrick & Carter Company, to which are added telephone connections and a fire alarm system. In each of the Style E Telephones is placed a fire alarm bell.



The telephone measures 4½ inches by 8½ inches and is 8½ inches deep. It is made of polished oak, finished with a black rubber face and nickel trimmings. All the batteries of this system are in the basement and are so arranged that any of the rooms can communicate with the office, or intercommunication can be effected between any points desired. The annunciator is in the hallway by the cashier's desk, where there is always some one in attendance. The service given by this arrangement is extremely satisfactory, and combining as it does a fire alarm system with the telephone system it is doubly valuable.

In case fire should be discovered, any employee can go to the annunciator, open a little door in front and pull out a plug, which releases the clockwork mechanism and starts the fire alarm going. This rings all the bells throughout the house, so that the system insures both convenience and safety to the occupants of the club.

Death of Henry H. Bentley.

Henry H. Bentley, the "father of the local telegraph," and widely known through his connection with telegraphy and electrical affairs, died on the 7th inst. at Stanford Heights, near Rhinebeck, N. Y.

Mr. Bentley was born in Dutchess County, New York, in 1884, and at the age of 20 years he went to New York City on a canal boat to seek his fortune. He got into the electrical business by becoming connected with J. B. Richards, a skilled mechanic, who was perfecting Royal E. House's printing telegraph instruments. Mr. Bentley assisted in organizing the New York City and Suburban Printing Telegraph Company, of which he was made the general manager. The company opened offices for the transmission of messages at a low rate, but did not succeed. Then Mr. Bentley proposed to the capitalists who were in the concern that they lease the lines to him for 25 per cent. of the proceeds, and they accepted. He opened offices in various hotels and other places and soon began to make money rapidly. He laid a cable to Brooklyn, which no one else had successfully done, and thus added a large and profitable business to what he already had. The success of this enterprise, it is considered, made him the father of the local telegraph business.

Soon afterward his health broke down and he disposed of his local telegraph interests and removed to Philadelphia where he was engaged as war correspondent of the "Inquirer." Shortly after the war he again took up local telegraphy and built several private lines, which were subsequently amalgamated under the management of the Philadelphia Local Telegraph Company. He organized a service for bankers and brokers and a local news service which was maintained for many years. A branch office of the local service was organized under the name of the "Gold and Stock Reporting Telegraph Company." Of this company Mr. Bentley was also the president. He was identified with the management of all the Western Union Telegraph Company's subordinate companies. Mr. Bentley helped to organize the Bell Telephone Company of Philadelphia and for eight years was its president.

Threatened Litigation in the South.

The "Tribune" of Knoxville, Tenn., states that Frank R. Colvin, representing Barton & Brown, solicitors and counselors for the Western Electric Company, has been in that city looking into the telephone patent situation. Mr. Colvin is reported having said that the People's Telephone and Telegraph Company of Knoxville has made certain infringements of the Western Electric Company's patents, and when the time comes the whole matter will be made public through the courts. J. C. Duncan, manager of the People's Company, in an interview declared that the Western Electric Company would not scare his company, as they knew what they were doing before they built their exchange.

In the Interest of the Public.

To the Editor of ELECTRICITY.

DEAR SIR: We have no doubt that your independence on the telephone situation, being, as it is, in the interest of the public, will bring you, as it deserves, a large increase of business. Yours very truly,

THE RAWSON ELECTRIC COMPANY,
T. M. BRUSH, Secretary.

Elyria, Ohio, September 9.

After repeated delays the Board of Public Works of Indianapolis, Ind., and the Phœnix Telephone Company have come to an adjustment of differences touching the matter of a telephone franchise. A contract has been executed under the terms of which the Phœnix Company agrees to establish an underground service in a prescribed district, such conduits to be of sufficient size to accommodate all other electrical wires, the rentals for which shall not exceed ten cents per lineal foot per year. Telephones for the city's use are to be furnished at $18 and $15 per year; for business houses, $42; residences, $30, if within the two mile limit. For each additional mile $6 per annum is to be added to the above rates. The company agrees to pay the city [illegible] per cent. of its gross receipts each year after and including the fourth year of its operation. The company will execute a bond for $ 0,0 0 for the faithful performance of the terms of the contract; assumes all liability for damages to person or property, and will defend all suits for alleged infringement. During the first five years the company will put in a conduit system, and after that will extend the system at the rate of 2,[illegible]00 feet each year for fifteen years. The plant is to be completed by December 31, 1896.

The exchange of the Blue Earth Valley Telephone Company at Winneboga City, Minn., has been opened, giving connection with Woodland, Nashville, Blue Earth City and Elmore. The company will, as early as possible, extend lines to Fairmont, Wells, Amboy, Lake Crystal and Mankato. When connected with the line from Mankato northward it will give this entire system connection with the Twin Cities.

The Harrison International Telephone Construction Company has given up the fight against the Bell Company in Anderson, Richmond, Fort Wayne and Terre Haute, Ind. This company had franchises in each of these places, but the local Bell companies put up such a show of fight that the Harrison Company became frightened and quit the field.

The plant of the Meridian and Tuskaloosa Telephone Company, covering the post-offices of Zero, Causeyville and Hurricane Creek, Miss., and Pashmatha, Butler, Mount Sterling and Tuscahoma, Ala., has been put into operation. Another line is being constructed to Daleville, Miss., via Marion, Topview and Lockhart.

To meet the $21 and $18 rates of the Lansing (Mich.) Telephone Exchange the local Bell Company has reduced its rates to $20 and $16. The new company has contracts for 350 instruments and will be ready to open its exchange about October 1.

The City Council of Franklin, Ind., has reconsidered the vote by which a twenty-year franchise was voted to the Phœnix Telephone Company at a previous meeting. This was done in deference to public sentiment, which is unalterably opposed to long-term franchises.

The village board of Penn Yan, N. Y., has decided to grant a franchise to W. Stanley Bruen to erect and operate a telephone system in that village. The system will be extended to Keuka and Gibson, and into Ontario County, N. Y.

The village board of West Springfield, Ill., has passed an ordinance giving the Central Union Telephone Company right of way through the village, but requiring them, after five years, to pay 4 per cent. of their gross earnings to the village.

The Pana Telephone Company proposes to build exchanges at Anderson, Tipton, Kokomo, Logansport, Summitville and Alexandria, Ind., connecting them with Elwood.

The Subscribers' Automatic Telephone Company is being organized in Cleveland, O., by prominent local capitalists. The new company is to be capitalized at $1 000,000.

The Standard Telephone and Electric Company, Madison, Wis., will supply the equipment of 125 instruments for the new exchange at Menominee, Wis.

Dr. T. W. Renshaw and William and Joseph Snyder, of Summit Hill, Pa., are promoters of the new telephone company being organized in that place.

W. B. Hardman, L. G. Hardman, T. C. Hardman and W. D. Thurmond have applied for a charter for a telephone company to build a line from Harmony Grove to Athens, Ga.

The City Council of Delaware, O., has granted an extension of six months to the telephone franchise to D. S. Fisher and associates.

An ordinance has been adopted by the City Council of Jacksonville, Fla., granting a telephone franchise to W. N. Shine and A. H. King.

The City Council of Rochester, N. Y., is considering the granting of a franchise to the Standard Electric Telephone Company.

The Wisconsin Telephone Company will make an extension of the long-distance line to Eau Claire from Madison by way of La Crosse.

The Southern Michigan Telephone Company has a franchise at Schoolcraft and will put in instruments at $8 and $12 a year.

E. A. Buck, of Douglas, Ga., will build a telephone line from Douglas to McDonald's Mill.

S. B. Kinard will erect a telephone line from Jackson to McDonough, Ga.

Louisville, Ky., now has long-distance telephone connections.

T. A. Parrish is organizing a telephone company at Pine Bluff, Ark.

P. E. Blumer will establish a telephone system at Ellisville, Miss.

Telephone exchanges are proposed at Stanford and Paducah, Ky.

New Companies Incorporated.

The Phœnix National Telephone Company, Des Moines, Ia.; the general nature of the business shall be that of constructing, owning, operating and managing telephone exchanges, telephone plants and telephone instruments, and constructing, owning, managing and operating steam and electric railways, including appliances and necessary real estate connected therewith, and constructing and operating gas and electric light and power plants and construction of vehicles propelled by electricity or other power. Capital stock, $1,000,000. Incorporators: Charles M. Waterbury, John W. Paris, Noah J. Clodfelter, Charles A. Meeker, Addison Bybee, Curtis D. Meeker, Gould Rhodes, Jacob Frankel, George W. Hadley and J. M. Smith.

The Alice, Wade City and Corpus Christi Telephone Company, Alice, Texas—to construct and maintain a telephone line in and through a number of counties of Texas Capital stock, $3,000. Incorporators: George Hobbes, Thomas C. Wright and John Wade.

The Greenwood Telephone Company, Greenwood, Ind. Capital stock, $3,000. Incorporators: Grafton Johnson J. F. Crawford and J. Albert Johnson.

ELECTRICITY.

Vol. IX. NEW YORK, SEPTEMBER 25, 1895. No. 11

ELECTRICITY

Published every Wednesday by the
ELECTRICITY NEWSPAPER CO.
B. E. GREENE, PRESIDENT.
L. J. MONTGOMERY, SECRETARY.

Publication Office, - - 6 Park Place, New York.

EDITORS: NELSON W. PERRY.
BURTON E. GREENE.
R. H. WILLOUGHBY.

BUSINESS MANAGER, - - - JOHN L. GANS.

SUBSCRIPTION RATES:

UNITED STATES,	$2.50
IN CLUBS OF FIVE OR MORE,	2.00
FOREIGN COUNTRIES,	4.50
SINGLE COPIES,	10 cents

ADVERTISING RATES:

As ELECTRICITY reaches all classes interested in electrical work, its value as an advertising medium can be readily understood. Rates will be sent on application.

Changes of advertisements should reach the office not later than the Saturday preceding the day of publication.

Entered at the New York Post Office as second-class mail matter.

THE TRADE SUPPLIED BY

EDITORIAL NOTES.

Meeting of the British Association. The meetings of the British Association for the Advancement of Science, which were held at Ipswich from September 11 to September 18 inclusive, are now a matter of history.

The British Association has about the same scope as and is the prototype of our American Association for the Advancement of Science, viz., it aims to cover the whole field of scientific research, and its deliberations are concerned more with pure theory than with practice. In order to cover this wide field, the Association is divided into sections, each of which concerns itself with some particular branch. That under whose especial care comes electrical science is designated as Section G.

As announced in our issue for September 18, the papers to be read before this section were one by W. H. Preece and A. P. Trotter on "A New Portable Photometer," one on "Deodorizing Sewage by the Hermite Electrical Sanitation Process" by J. Napier, the Borough Analyst of Ipswich, where the process has been introduced, and one on "Modern Applications of Electricity to Traction" by Philip Dawson, all of which are given in abstract in this issue of ELECTRICITY.

The leading feature of these meetings is always the Presidential Address of the incoming president. It is usual for him to take up some one branch of science in which his life work has been done, and to treat it somewhat exhaustively either from a historical or from an experimental standpoint. These addresses are usually of a very high order, as was that of Lord Salisbury, who opened the Association meetings last year.

The incoming president was Sir Douglas Galton, K. C. B., who reviewed scientific progress during the existence of the Association.

After a few introductory remarks he said: "About forty-six years ago I first began to attend the meetings of the British Association, and I was elected one of your general secretaries about twenty-five years ago.

"It is not unfitting, therefore, that I should recall to your minds the conditions under which science was pursued at the formation of the Association, as well as the very remarkable position which the Association has occupied in relation to science in this country."

It must be confessed that Sir Douglas's intimate and long association with the organization particularly fitted him to undertake the self-imposed task, and it is doubtful if any one could have done it better or so well, but it was a herculean task, and by reason of the necessary limitations, both of time and space, it was impossible to do justice to any one branch.

The address as it appears before us is a pamphlet of thirty-three pages and embraces nearly 16,000 words—too long to be reproduced even in abstract, and covering too wide a field to be interesting to the tillers of any. It will, however, be treasured by all as a work of reference—a hand-book, as it were, of the progress of science, to which reference may handily be made for the milestones of scientific progress. As such it will find a place on every scientist's library shelves, whether he be an electrician, physicist, chemist, astronomer, geographer, botanist, physiologist, anthropologist, bacteriologist, sanitary, civil, mechanical or mining engineer, or what not, for the specialties of each of these professions are separately touched upon.

The paper by Messrs. Preece and Trotter on a new portable photometer treats of a most important question, viz., how to determine practically the actual illumination received by a surface from a more or less distant source.

The practical difficulties in the way are admitted at the outset, but one of them at least seems to have been fairly well met, viz., that of grading nicely the standard of illumination. This is accomplished by making the standard a reflected light from a source of predetermined photometric value and the graduation of this standard by varying the angle of incidence of the ray. By moving this reflecting surface through varying angles with the ray its reflected strength will be as the cosine of the angle. Very nice gradations can thus be attained, and it appears to us that a very great step has thus been taken towards a method of determining the important desideratum of practical illumination values. There still remains one serious defect, viz., that due to the difference in color between the standard light and that whose illumination is to be measured. The authors suggest a method, however, by which this disturbing effect of color may be reduced to a minimum. The first part of this paper is given in full in this issue and will be followed by the second part in a succeeding issue. Abstracts are also given of Messrs. Napier and Dawson's papers.

Other papers read, and which will appear later, were "Magnetism in Rotation," by Silvanus Thompson; "Telegraphy by Induction," by W. H. Preece; "The Development of the Telephone in Agricultural Districts," by Maj.-Gen. Webber; "The Glow Lamp," by W. H. Preece; "Telephony," by A. K. Bennett; "The Telegraph in the Chitral Campaign," by P. V. Luke, and the "Chloride Battery," by W. H. Earle.

Altogether Section G seems to have been pretty well supplied with papers, some of which at least are of extreme interest. In this respect the B. A. meeting will compare favorably with the recent meeting of its offshoot—the American Association for Advancement of Science. We are sure, however, the American organization will not suffer in the least by a comparison between the electrical papers presented to the two Associations.

* * *

Standardizing Lamp Sockets. In the early history of the incandescent lamp manufacture, as in the early history of most other new lines of manufacture, there was a tendency with each manufacturer to impress his own individuality upon that which he had to sell. In the lamp industry each manufacturer had a different base and socket. This was done partly as a trademark and partly because each manufacturer thought he had something a little better than his competitor. In time the inevitable law of the survival of the fittest began to make itself manifest, and those types of lamp bases and sockets which had lesser merit disappeared and only those survived which had either more persistent support from their manufacturers or were of greater merit.

At the present time there are practically but three sockets in the market, viz., the T.-H., Westinghouse and Edison. Granting that all of these three sockets have equal merit, why should they exist? The incandescent lamp is now such a staple article that there should be no lack of uniformity which would render the interchange of lamps of different makes impossible. A correspondent, himself a large lamp manufacturer, Mr. J. H. Rhotehamel, writes us a very timely letter on this subject which we indorse most heartily. He says:

> By reference to our cost sheets we note that the bases for our lamps to fit T.-H. sockets cost between $7 and $8 a thousand more than do the Westinghouse or Edison bases. The cost of all the other odd bases to fit the various odd sockets in use, such as the U. S., Brush-Swan, Mather or Perkins, Shafer or National, and Hawkeye, is still an additional amount. It is, therefore, desirable, as far as possible, that the best style sockets be used in original installations, and we think that an editorial on this subject in your valuable paper, calling the attention of construction men and supply houses to this fact, would aid the lamp manufacturers as well as the users of incandescent lamps, as the time is not far distant when an additional charge must be made for lamps mounted in other than Westinghouse or Edison style bases. We ourselves would prefer the Westinghouse style, but of course you could not afford to take any position of this kind as it would show some favoritism, but as the Edison and T.-H. sockets are practically made by the General Electric Company, they would no doubt be glad to eliminate entirely the T.-H. base. We at present understand that the General Electric Company are charging one cent more for lamps with T.-H. bases.

Aside from the inconvenience resulting from the lack of uniformity, Mr. Rhotehamel points out that in view of the fact that the margin of profit in the lamp business is growing smaller and smaller, one of the greatest essentials for fitness is cheapness. The T.-H. socket is at a disadvantage in this, and it would seem must surely drop out of the race. But why should there any longer be a Westinghouse or an Edison socket? Cannot those most interested get together and decide upon a *standard* socket? We do not know who "the most interested" parties are, whether they be the lamp manufacturers, the contracting engineers or the users of the lamps, for all three are deeply interested parties. We surmise that the National Electric Light Association comes more nearly comprising all these than any other organization, and we suggest that this question of a *standard* socket be brought before the body at its next annual meeting in New York.

* * *

THERE is some reason to believe that the managers of the G. E. Company are at last convinced that ELECTRICITY has been telling them wholesome truths in regard to the lamp business for the past year. There have been lately several consultations over the affairs of the Harrison factory, which is admitted to have been losing money right along. It is now proposed to abolish the rebate plan. If they will go one step further and advance the price of lamps about five cents, they will stand a better chance of ultimate success. They also need to improve the quality of their lamps, which are the poorest made at this time. We guess they realize now the serious mistake made in displacing Mr. F. M. Upton, who knew more about the economical management of a lamp factory than any half dozen of the men now in charge at Harrison.

Under the Searchlight

Views and Opinions on Timely Topics.

WHEREVER Mr. James E. Keelyn is there is always activity and also excitement. He has already, with a small and conservative company, made more stir in the telephone field than the Standard and Harrison companies with their one or two hundred millions of "capital." Mr. Keelyn's latest effort is to have the Bell Telephone Company proceeded against as a Trust. This would be an amusing job to a man of leisure. The very thought of it no doubt amuses the Bell Company. But the independent telephone companies have more serious matters on hand just now, the most important of which is to stop the Bell Telephone Company from winning patent suits. A few more victories for the Bell people and the independent telephone movement will be a thing of the past.

* * *

IT is stated that Mr. Coffin's associates on the G. E. Board, in the belief that his sudden death would result in an immense financial loss to the company by reason of the many trades and deals which no one but Mr. Coffin can interpret, is carrying $1,000,000 insurance on the latter's life. There is grim humor in this valuation of Mr. Coffin's life. Nervy Evans used to say that Coffin's smile alone was worth a million.

* * *

What They Are Here For.

We have now about a dozen State Railway Associations, besides the National organization which meets at Montreal next month. Those who criticise the quality of the most of the papers read (by title) at the annual meetings of these Associations are reminded by the annual report of the Executive Committee of the N. Y. State Association that the binding tie for the members is not the reading of papers. The report says:

> Upward of thirty bills pending in the Senate and Assembly of this State at one time, all of which, with very few exceptions, were obnoxious and adverse to the interests of street railroads throughout the State, will enable you to form an idea of the activity during the past year of legislation affecting street railroads and their operation, without questioning the good intent of the various members presenting these measures.
>
> Had half of the bills offered become laws, street railroads would have been driven out of business. Energetic, prompt and persistent effort on the part of this Association and its active counsel undoubtedly aided materially in defeating a large number of the adverse bills. The presiding officers of this Association, together with the counsel and different members of the Association, appeared from time to time before the various committees of the Assembly and Senate, to whom these bills were referred, and in every instance were accorded courteous treatment and a polite hearing, and found only a disposition on the part of the various committees to treat all questions upright and fairly.
>
> With the increased number of representatives comprising the next session of the Legislature, it is consistent to anticipate the presentation of an increased number of bills affecting our interest; therefore your committee urges the importance of the continuance and enlargement of this Association, so that united effort and concerted action may be obtained in considering and meeting the various issues as they arise. Increased membership and active interest in our organization will prove fruitful of beneficial results.

* * *

IF there had been no ground for fighting the patent suits which were sure to be brought by the Bell Company, then the telephone companies which started in business were guilty of the grossest kind of an offence against business morality in offering their wares to the public.

* * *

THE *Electrical Review* in speaking of the "Marks Electric Sparks," an association composed of the workmen of the Bishop Gutta Percha Company, says:

"Captain Marks, after whom the association is named, is a prominent member of many societies and organizations, and has the proud distinction of being longer connected with the manipulations of gutta percha and similar compounds for the insulation of copper wires for all electrical purposes than *any man* in America—an unbroken period of over 26 years."

Does Brother Price mean that Capt. Marks has been longer connected with the business than any *other* man, or does he really mean that Capt. Marks has been connected with the business longer than any *man*. If he means the latter, what species of animal does he consider Capt. Marks to be?

Be careful of your English, Brother Price; be careful of your English!

* * *

Sleepy Eye Wakes Up.

Sleepy Eye, Minn., Sept. 17.—At a special meeting of the village council held last evening the contract for an electric light building was awarded to Angus McLeod & Co., of Minneapolis, the consideration being $6,100.

COMMUNICATION.

The Telephone Situation.

To the Editor of ELECTRICITY.

SIR: In the *United States Investor*, under the date of May 18, there was an article on the Harrison Telephone Company, and in connection with it were the following words: "It may not be generally known (but it is confidently asserted by those who are in close touch with the workings and management of the Bell Telephone Company) that the Standard and Bell are no more and no less than one and the same. In territory where the Bell cannot operate successfully, the Standard will be the alternative."

There has been a good deal of curiosity here regarding the Standard Telephone Company, of which Thurlow Weed Barnes is president, and they have made certain representations which electrical people here would like to be assured of, and as one of the readers of your valuable journal, write you to learn if possible the standing of the company. Can you inform me whether or not they own a telephone and whether or not they have built or are building any plant whatever? They claim that they are manufacturing telephones in Cleveland; also claim to own a multiple switchboard; also that they are now building long distance lines from Washington to New York via Baltimore and Philadelphia and putting lines underground in Newark. We should like to be thoroughly posted, if possible, about the points above; and for the benefit of your readers, should like your opinion about this company, their intentions and their operations. The *United States Investor* is of course a very reputable journal, and making the assertion which it does, it has naturally drawn some attention; if such a journal would take upon itself to make this statement, or at least to publish it, we think that you could benefit your subscribers and readers by your views in the matter. Very truly yours,

B. L. Woom

600 Oregonian Bldg., Portland, Ore., Sept. 7, 1895.

It is difficult to make any definite or instructive answer to the above. The Standard Telephone Company has so far been engaged chiefly in selling its stock and State rights. What it has to offer in the way of an operative telephone outfit it has not yet made known to the public. The opinion of most telephone men in the East, that the company has nothing solid to build on, is not an unreasonable one taking into account the refusal of the Standard Telephone Company to give out any authentic information. We do not believe that they are building any lines, or that they have any factory. They are possibly having a few instruments made under contract.

No municipality should give or sell a franchise to any of the independent telephone companies without full assurance under guarantee that they will install an exchange within a reasonable length of time or forfeit their franchise and lose their bond.

The public is justified in looking askance at any company launched as were the Standard and Harrison companies. Relief from telephone monopoly is not likely to come through such organizations.

The Young Men's Institute.

There is an institution at 222 and 224 Bowery, New York City, which is a fine example of practical Christianity, and for the past ten years has been doing a most commendable work. It is the Young Men's Institute of the Young Men's Christian Association, and is much like the Polytechnic Christian Institute of London. A prominent part of its work is the educational department. Last season 463 young men, between the ages of 17 and 35, were enrolled in the evening educational classes in the following subjects: Bookkeeping, penmanship, arithmetic, English grammar, short-hand, typewriting, mechanical, architectural and free-hand drawing, carriage drafting, steam engineering, electricity and vocal music. Most of these pupils come from the shops, offices and factories of the city. There are also bowling alleys, a well equipped gymnasium and shower and spray baths.

The fees charged are only nominal, varying from $4 to $7.50 per year, according to the number of privileges taken by the member. Improvements have been made in the building during the past summer and the public is invited to a grand opening on Tuesday evening, October 1.

SOCIETY NEWS.

The Canadian Electrical Association.

The Canadian Electrical Association opened its Convention at Ottawa on the 17th inst. under most auspicious circumstances. The headquarters were at the Russell House.

Among the papers read were the following:

"Some Notes on the Consolidation of Two Systems of Electric Supply," A. A. Dion, Ottawa.

"The Telegraph in Canada," Chas. P. Dwight, Toronto.

"Suggested Forms for Electric Light Accounting," D. R. Street, Ottawa.

"From the Coal Pile to the Meter," Jas. Milne, Toronto.

"Some Modern Alternating Current Apparatus," H. T. Hartman, Peterborough.

"Non-Interference Diplex Relay;" "A Percentage Method for Circuit Measurements," D. H. Keeley, Ottawa.

Mr. K. J. Dunstan, the president, in his address, among other things, said "that the question of municipal control of city lighting was fought to an issue in Toronto in a contest remarkable for warmth and energy. Every effort was made on both sides to educate the people in the way they should go to the polls, the result being that the by-law to provide funds to erect the civic plant was defeated by a vote of 8 to 1." In reference to the conflict between gas and electric light, he said that "this year a new disturbing element was found in the form of acetylene gas. This gas had important defects to prevent it coming into general use, but at the same time it will prove an important factor."

The election of officers of the Association resulted as follows:

President—A. B. Smith, Superintendent Great North Western Telegraph Co., Toronto.

First Vice-President—C. B. Powell, Ottawa Electric Co., Ottawa.

Second Vice-President—L. B. McFarlane, Manager Eastern Department Bell Telephone Co., Montreal.

Secretary-Treasurer—C. H. Mortimer, Toronto.

Executive Committee—W. Y. Soper of Ahern & Soper, Ottawa; George Black, Manager Great North Western Telegraph Co., Hamilton; E. C. Breithaupt, Electrical Engineer, Berlin, Ont.; J. J. Wright, Manager Toronto Electric Light Co.,Toronto; O. Higman, Internal Revenue Department, Ottawa; J. A. Kammerer, General Agent Royal Electric Co., Toronto; F. W. Badger, City of Quebec; A. Wickens, Electrical and Mechanical Engineer Parliament Buildings, Toronto; John Carroll, Secretary-Treasurer Eugene F. Phillips Electrical Works, Montreal; K. J. Dunstan, Manager Bell Telephone Co., Toronto.

The next place of meeting will be in Toronto, in June, 1896.

The banquet tendered to the Association was a novelty in more than one respeet. Electricity was utilized in every possible way to beautify the dining-room of the Russell House. The decorations were illuminated by electricity, and in the midst of the room was a brilliantly lighted revolving float. Many ladies were present, and occupied seats with the gentlemen at the tables. Each chair at which a lady was seated was surmounted with a floral arch, at the top of which was an electric light. The serving of the dishes was done on a raised platform within the sight of all, and as the knives were sharpened they emitted flashes of electricity.

American Institute of Electrical Engineers.

The 99th meeting of the Institute will be held on Wednesday, September 25, 8 P. M., at the Hoffman House, corner Broadway and 24th street, New York City.

A paper will be presented by Mr. Charles S. Bradley, of Baltimore, on "Phasing Transformers."

Arrangements are being made for an exhibition of the apparatus in operation in the banqueting hall of the Hoffman House.

A meeting of Western members will be held the same evening at the Armour Institute, Chicago, where the above paper will be read by Mr. Hulse, and the apparatus also exhibited in operation.

At the meeting to be held October 16, a paper will be presented by Mr. Herman Lemp, Jr., of Lynn. Mass., on the "Local Annealing of Harveyed Armor Plates."

Henry Electrical Club.

The Henry Electrical Club will hold its first meeting on Friday, October 4, at the rooms of the American Institute of the City of New York, 111–115 West 38th street. Hereafter lectures will be delivered on every Friday night.

One other night in the week, Tuesday, will be devoted to class work, where the members are allowed to ask questions, and such questions are discussed by an instructor. This part of the club is under the supervision of the University Extension of the State of New York, which ought to be of direct advantage to the members, inasmuch as they are allowed to undergo examinations, as a result of which they receive, if their knowledge is sufficient, a regent's diploma in due time.

For further particulars, people are requested to address Mr. Geo. W. Whitefield, the secretary of the Institute, 111–115 West 38th street.

New York Electrical Society.

The opening meeting of the Society for the season 1895–96 will be held at Columbia College on Friday, September 27, at 8 P. M.

Mr. T. C. Martin, Editor of the *Electrical Engineer*, will deliver a lecture entitled "Niagara on Tap."

The Brooklyn Institute Programme.

The Department of Electricity of the Brooklyn Institute of Arts and Sciences make the following very attractive anouncement for the season 1895–6:

October 4. Lecture by Mr. T. Commerford Martin, of New York, Editor of the *Electrical Engineer*. on "The Electrical Use of the Niagara Water Power Plant, or Niagara on Tap."

November 4. Lecture by Prof. William A. Anthony, Ph.D., of New York.

December 6. Mr. Gano S. Dunn, of the Crocker-Wheeler Company, has been invited to lecture on "The Principles of the Dynamo. and Recent Improvements in the Application of the Same."

January 3. Lecture by Prof. Harris J. Ryan. M.E., of Cornell University, on "The Properties of Paraphase Currents."

February 7. Prof. M. I. Pupin. Ph.D., of Columbia College. has been invited to lecture on "Electrical Resonance and Alternating Currents."

March 6. Lecture by Mr. A. E. Kennelly of Philadelphia, on "The Electrical Transmission of Energy from the Niagara Electric Power Plant."

April 3. Lecture by Mr. William S. Barstow, first vice-president of the department, on ' New Problems in Electric Lighting for Large Cities."

May 1. Annual meeting. Lecture by Prof. George W. Plympton. M. E., of the Polytechnic Institute. on "The Action of Electricity Escaping from Trolley Lines on Water and Gas Pipes. and the Remedy."

A course of six illustrated lectures on "The Applications of Electricity in the Arts and Sciences." Prof. William A. Anthony, Ph.D., of New York, has been invited to give the lectures on successive Monday evenings, beginning in November. The course will be given in the lecture room of the Edison Electric Illuminating Company, 360 Pearl street. where excellent facilities for illustrating lectures are provided.

Meetings for the reading and discussion of papers on special subjects will be held alternately with the regular monthly meetings of the department. A library and reading room in which will be kept the leading books and periodicals on electricity will be accessible to members on the evenings of meetings and lectures, at 174 Montague street.

The Montreal Convention.

As announced last week, a special train will leave New York over the New York Central Railroad on the evening of October 14, arriving in Montreal Tuesday A. M.

The eastern Pennsylvania delegation are arranging for a day ride, and expect to leave New York on Sunday morning, October 13, arriving in Montreal at 9:50 P. M. on that day. They will have two or three special cars, and also go over the New York Central to Albany, and from that point over the Delaware and Hudson Railroad to Montreal.

This latter is a charming route, the road skirting the western shore of Lake Champlain for almost its entire length. The view eastward, taking in the mountains of Vermont in the distance, is almost unsurpassed, and is at its best at this season.

New Yorkers who wish to join the Philadelphia party here can no doubt make arrangements through Mr. C. A. Bragg or Mr. John Brill of Philadelphia.

The N. E. L. A. Exhibit.

Some of the gentlemen interested in holding an exhibition of electrical apparatus in conjunction with the next annual meeting of the N. E. L. A. have held a preliminary conference, and will soon submit a proposition to the committee of the Association appointed for the purpose.

The plan is to run a four weeks' show, making it the most complete exhibit of the kind ever under taken.

The opportunities are large, and if properly managed the affair ought to be a grand success.

New York State Street Railway Association.

The annual meeting of the above association was held at Albany on Tuesday, the 17th. The meeting was a lively one and the business subjects before the Convention received sharp attention. The question of admitting supply men was again settled in the negative.

The report of the Treasurer showed the following condition of the treasury for the year:

Receipts	$7,286.57
Expenses	6,299.76
Balance	$986.81

The following papers were offered:

"Are We Laying Too Many Miles of Track to Reach a Few People?" by Mr. W. W. Cole, of Elmira.

"Economical Equipment and Operation of Power House," by Mr. H. S. Newton, of Syracuse.

"Is a Freight or Mail Service Profitable or Unprofitable on Street Railways?" by Mr. Benjamin Norton, of Newburg.

"Car Heating by Electricity," by Mr. J. F. McElroy, of Albany.

"General Track Construction," by Mr. C. Loomis Allen, of Syracuse.

"Signals on Electric Railroads," by Mr. J. H. Barnard, of New York.

The following officers were elected for the ensuing year:

President, G. Tracy Rogers, Binghamton; First Vice-President, W. W. Cole, Elmira; Second Vice-President, John H. Moffitt, Syracuse; Secretary and Treasurer, Benjamin Frick, Brooklyn. Executive Committee: H. H. Vreeland, New York; John W. McNamara, Albany; Henry M. Watson, Buffalo.

The Association will next meet at Binghamton on the second Tuesday in September, 1896.

Those Present.

Allen, C. L., Civ. Eng., Syracuse St. Ry. Co., Syracuse.
Charles J. Bissell, Counsel Rochester Ry. Co., Rochester.
Cahoon, J. B., Supt. Elmira and Horseheads Ry. Co., Elmira.
Cole, W. W, Supt. Elmira St. Ry. Co., Elmira.
Clark, J. P. E., Gen. Man'r Binghamton St. Ry. Co., Binghamton.
Cleminshaw, Charles, Pres. Troy City Ry. Co., Troy.
Cooper, H. S., Supt. Schenectady St.Ry. Co., Schenectady.
Crouse, J. B., Crouse-Tremaine Carbon Co., Fostoria, O.
Frick, Benj., Sec. and Treas. Atlantic Ave. R. R. Co., Brooklyn.
Havens, Wm. E., Supt. Fishkill St. Ry. Co., Fishkill.
McKeever, R. T., Supt. Johnstown St. Ry. Co., Johnstown.
McNamara, John W., Treas. Albany Ry., Albany.
Meiklehan, T. M. R., Supt. B., Q. C. & S. Ry. Co., Brooklyn.
Morgan, Godfrey, Man'r Amsterdam St. Ry., Amsterdam.
Norton, Benj., Pres. Newburg Ry. Co., Newburg.
Newton, H. S., Elec. Eng. Syracuse St. Ry., Syracuse.
Rogers, G. Tracy, Pres. Binghamton St. Ry. Co., Binghamton.
Rusling, F. O., Supt. Buffalo Ry. Co., Buffalo.
Smith, Charles H., Supt. Troy City Ry., Troy.
Stedman, J. H., Transfer Dept., Rochester Ry. Co., Rochester.
Story, C. B., Sec. Hoosick Falls St. Ry. Co., Hoosick Falls.
Vickers, Albert, Electrician Syracuse Con. St. Ry. Co., Syracuse.
Wardwell, John S., Pres. Rome City St. Ry. Co., Rome.
Allison, Giles C., St. Louis Register Co., St. Louis.
Barnard, J. H., Interior Telephone Co., New York.
Barrett, Charles E., Hale & Kilburn Mfg. Co., Philadelphia.
Everts, Frank L., Supt. Utica & Mohawk Ry. Co., Utica.
Brady, Paul T., Westinghouse Co., Syracuse.
Cockey, Marston R., Roebling Sons' Co., New York.
Delaney, Wm. H., New York.
Dutton, W. S., Doerner & Dutton, Cleveland.
Estep, F. A., Nuttall Co., Allegheny.
Evans, H. C., Johnson Co., New York.
Everts, D. T., Simplex Co., New York.
Ewing, Geo. C., Electrical Specialties, Boston.
Fowler, F. H., Bemis Car Box Co., Springfield.
Ham, W. F., Johnson Co., New York.
Hanna, J. A., McGuire Car Truck, New York.
Issertel, H. G., H. W. Johns Co., New York.
Lawless, E. J., American Car Co., St. Louis.
Long, E. G., Peckham Motor Truck and Wheel Co., New York.

British Association.

(From our Special London Correspondent.)

The President's Address.

Sir Douglas Galton, K. C. B., D. C. L., F. R. S., delivered his presidential address on Wednesday evening, September 11. The president's address is always, of course, a general dilation upon the thousand and one questions of interest to the scientific mind.

Sir Douglas devoted his address to a brief history of all branches of scientific effort since the formation of the Association in September, 1831, denoting the various discoveries and advances of consequence which these sixty-five years have brought forth. The president divided his delivery into a number of sections—geological and geographical, chemical, astronomical and physical; meteorology, biology; engineering; smoke abatement; mechanical engineering, and a number of general points of interest to the Association.

Velocity of Light in Rarefied Gases Through Which an Electrical Discharge is Passing, by Edwin Edser and S. G. Starling.

Lord Rayleigh has published the result of a research relative to the velocity of light in an electrolyte through which there passed an electric current. Dilute sulphuric acid was used, and the conclusion reached was that the velocity was unaffected by the passage of the current.

It seemed to us worth while to perform a similar experiment to the above, substituting a rarefied gas for the electrolyte. The conditions are somewhat different, for though it has been shown by Prof. J. J. Thomson that the ordinary stratified discharge can be assimilated to a current passing through an electrolyte by considering each stratification to correspond to a Grotthus chain, yet there is left still outstanding the phenomenon known as the cathode rays. Prof. J. J. Thomson considers these rays to consist of a number of atoms, each carrying its tubes of force, and moving with a velocity comparable with 2×10^5 cm. per second. If these tubes of force consist of or comprise a number of vortex filaments of the ether, we might reasonably hope to detect some difference in the velocity of the light according as it moves with or against this ether current.

The method used by us is essentially that employed by Prof. Michelson in re-performing Fizeau's experiment, two vacuum tubes with plane glass ends being substituted for the tubes, through which, in his experiment, water was caused to flow. A discharge was produced in these tubes by a Ruhmkorf coil and the interference bands were carefully observed. No alteration could be detected on the discharge being reversed. The experiment was repeated at various pressures (determined by the McLeod gauge) with the same result.

We wish this communication to be considered as only preliminary, as these negative results might be due to the intermittence of the discharge, the current only flowing for an inappreciable period a few times a second. It might therefore be possible with a continuous current to obtain a positive result.

Modern Applications of Electricity to Traction Purposes, by Mr. Philip Dawson.

Mr. Philip Dawson read a very lengthy paper, which was accompanied by some very elaborate table matter, detailing the lines now in operation in Europe and those in other parts of the world by European constructors. He sketched first the progress made during the past decade, dealing with the introduction of the underrunning trolley and earth return; the adoption of electrical motive power by the West End Street Railway of Boston, U. S. A., in 1888; the rapid increase in mileage and equipment in he United States; and reference to the first prominently successful line in Europe at Halle, Germany, in 1891. This was followed by a statement of the present European traction systems now under contract. After dealing with the especial adaptability of electric traction to tramways and light railways, and describing the three methods of electrical power transmission employed, and stating the objections raised to the overhead wire system compared with its compensating advantages, he dwelt at length upon the parts of an electric tramway installation, denoting the latest machinery, apparatus and methods of construction. He concluded his paper with further particulars regarding notable existing installations, and dilated upon the application of electricity to railway service with special reference to certain lines in England and America; also spoke of the economic results already obtained by, and the probable extension and development of, electric traction in the near future.

Deodorizing Sewage by the Hermite Electrical Process, by J. Napier, F. C. S.

This process consists of passing an electric current obtained from a dynamo through sea water or a dilution containing magnesium and sodium chlorides, whereby a portion of the chlorides is converted into hypochlorite, a substance which disinfects, deodorizes and bleaches similar to the active ingredient of bleaching powder, viz., calcium hypochlorite. This solution is called the electrolized or "hermite" solution, and may contain from half to one gramme of active chlorine per liter. The author gives a brief history of the sewering at Ipswich during the last twenty years, showing the present system. The deodorizing effects of the electrolized (hermite) solution on sewage are dealt with, and the results of trials made in August and September, 1894, and June, July and August, 1895, are given.

An Improved Portable Photometer.

BY W. H. PREECE AND A. P. TROTTER.

When light falls upon a surface that surface is said to be illuminated. The illumination depends simply upon the light falling upon the surface, and has nothing to do with the reflecting power of the surface, just as rainfall is independent of the nature of the soil. As a rain gauge receives the full amount of rain when it is placed horizontally (disregarding wind), and receives less when it is tilted, so a surface is fully illuminated when it faces the source of light, and is less fully illuminated when the light falls upon it at an angle. The proportion between the full rainfall or illumination and the measured rainfall or illumination varies as the cosine of the angle of incidence of the rain or of the light. This angle is 0° and the cosine is 1 when the rain gauge is placed horizontally or when the light falls perpendicularly upon the surface.

It would perhaps be unnecessary to call attention to these very elementary matters were it not that difference between the photometry of illumination and the ordinary photometry of candle-power is often confused.

The lighting of streets and of buildings may be specified by the maximum and minimum illumination. The primary purpose of an illumination photometer is to measure the resulting illumination produced by any arrangement of lamps, irrespective of their number, their height, or of their candle-power. Illumination photometers containing sub-standards of light have been designed by Prof. Weber,* Prof. Mascart,† and others. One of us described an illumination photometer before the Royal Society in 1883.‡ This consisted of a box blackened within. Over the end was stretched a Bunsen screen of paper, on the middle of which was a grease spot. At a distance of twelve inches was another screen, of drawing paper. The grease spot was so screened that no light fell upon it except that which was reflected from the drawing paper screen. At the end of the box opposite the Bunsen screen was an eyepiece, consisting of a plain tube, within the box a small glow lamp was fixed, and in order to make a measurement of the illumination of the drawing paper screen, the current through the lamp was varied through a rheostat until the grease spot was invisible. The readings were recorded in luces, a lux being suggested by one of us at the Paris Electrical Congress, 1889,‖ as the name for the illumination due to a carcel lamp at 1 meter, and equivalent to a British standard candle at 1.058 feet. The only defect of this photometer was the yellowish and reddish color of the lamp when dimmed for low readings.

In 1884 we designed a portable photometer,* in which the lamp could be moved towards or withdrawn from the Bunsen screen, and a mechanism was provided by which, when a pointer moved a certain distance over a uniformly divided scale the displacement of the lamp was as the square of that distance. The Bunsen spot was viewed by Rudorff mirrors, in the usual way. This instrument worked well, but the range was small and could not be easily increased. The lamp would have to be moved to a very considerable distance from the screen for measuring the feeble illuminations met with in street lighting.

Eight years later, one of us experimented with modifications of this instrument, and found that in ordinary street lighting the illumination is often only equal to that due to one candle at 14 feet distance. A large number of different methods of reducing the light were tried. Many combinations of lenses, the eclipsing device used in dissolving views, photographically shaded glass screens and other devices were used, and, finally, a white reflecting screen was inclined at different angles to a small electric lamp, and on this principle a photometer was constructed in February, 1892. It was found that the Bunsen screen could be replaced with advantage by a simple white cardboard diaphragm pierced with one or more holes.† The illumination of this diaphragm, generally in a horizontal position, was the illumination to be measured. Below this was the reflecting screen, enclosed in a box about 2 feet x 6 inches x 5 inches, with a pair of small glow lamps and a secondary battery. The screen could be inclined towards the glow lamps by means of a chain wound up on a cam mounted on a spindle, the cam being formed so as to give an open scale. A hand or pointer indicated readings on a dial. Many measurements and a number of photometrical surveys of different streets and public buildings in London were made in 1892, and are recorded by means of plans with isophotal contour lines and otherwise.‡

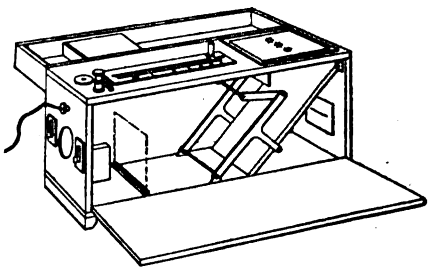

FIG. 1.

During the present year an improved form of this photometer has been constructed. The chain and cam, which allowed the instrument to be used only in a horizontal position, have been replaced by a system of levers. The object of these levers is to give an open scale. If the motion of the pointer were proportional to the angular movement of the screen, the scale would be approximately a scale of cosines. The instrument is shown in Fig 1, with the lid open, and the front let down. It measures 1 foot 3¾ inches by 5½ inches by 9½ inches high (400 mm. x 140 mm. x 242 mm.). On the end to the left there is a red glass window, and immediately within are two 12-volt lamps (one of which is shown in Fig. 2), one of about 1 candle power, and the other of 2 candle-power. It can be seen through the window if either or both of the lamps are alight. The lamps are held in special lamp-holders, capable of adjustment as to height by clamping screws. These clamping screws and the base of one of the lamp-holders are shown in Fig. 1. A switch on the top of the instrument enables either or both of the lamps to be turned on or off. At the other end of the box the reflecting screen is hung. The middle of the screen is about 11 inches (28 cm.) from the lamps. It is shown in Fig. 1 in its lowest position. In Fig. 2 the screen and one of the levers, together with one of the rollers on which the screen rests, and the handle by which it is moved, are shown with the screen in its highest position by full lines and in its lowest position by dotted lines. In its highest position the filaments of the lamps are a little below the plane of the screen. No direct light from the lamps reaches the screen, and it is only faintly illuminated to about $\frac{1}{16}$th of one candle at a foot, by stray light, which is excluded as much as possible.

The diaphragm is placed horizontally immediately above the hinged screen. Three small star-shaped holes are cut in and through them, the illuminated reflecting screen can be seen. A handle carrying a pointer, moving over a graduated scale, controls the inclination of the screen by means of the levers and links. A guide attached to the back of the screen (shown in Fig. 2) allows the instrument to be turned on its side without interfering with the working. In order to take a measurement, one or both of the lamps are turned on, and the handle is moved until the screen seen through the holes in the diaphragm matches the diaphragm in brightness. If the color of the light outside is about the same as that of the lamps, the middle hole may be made to disappear. The observer should stand approximately in the vertical plane passing through the three holes, so that he may see that part of the screen through them which lies immediately beneath them.

Various substances have been tried for the diaphragm and screen. Thin metal painted with a whitewash made of magnesia and isinglass is perhaps the best. The diffused reflection practically follows Lambert's cosine law, but the material is easily soiled and cannot be cleaned. Bristol board from which the glaze has been removed by a damp cloth, closely follows the cosine law within the angular range required in this case. It is important that there should be no glaze on the surface of the hinged screen, since the inclination of the lamp to the screen and of the screen to the eye for maximum illumination, is about 45°. But as the scale is graduated by experiment, a slight departure from the cosine law does not matter. On the other hand, it is of greater importance that the screen should be very smooth and flat. Under very feeble illuminations the light from the small lamp, making an angle of incidence very nearly 90°, minute irregularities are easily seen, and make accurate readings difficult. For ordinary street lighting and for general industrial photometry, a slight departure from the cosine law on the part of the diaphragm is of no practical consequence so long as there is no perceptible glaze, for it is always observed nearly vertically and never at a large angle.

(*To be continued.*)

THE PROPOSED MAGNETIC UNITS.*—II.

University College, Liverpool, Jan. 15, 1895.

Dear Professor Lodge: In reference to the sizes of the magnetic units proposed by you, I find that the weber 10^8 C.G.S. would only be used in fractions. The largest dynamo that I know of has a magnetic flux, or, as you propose to call it, an induction of 0·5 weber. From this the value will go down to about 0·01 in small motors. These figures are, however, by no means inconvenient.

Transformers will be rather smaller. In these the weber-turn is a convenient size and an interesting quantity, as it is given by ¼ *of the mean volts per cycle*, or, more accurately expressed, *mean volts per unit frequency* ÷ 4. Its numerical value will lie between, say, ¼ and 50 according to the volts and the frequency; but it gives no indication of the size of the transformer.

The henry 10^9 C.G.S. is also large. The inductance of choking coils would in general be fractions of a henry. The inductance of the winding of a transformer has no very important meaning, but it has a convenient size. Measuring it as *mean volts per unit frequency ÷ four times the open circuit current in amperes*, the inductance of the primary coil on a 2 H.P. closed magnetic circuit 1,000-volt transformer would be about 40 henrys.

The inductance of pairs of cables would run from 100 to 1,000 microhenrys per kilometer, but the value would vary with the arrangement.

The induction per unit area is good; having a value in practical work from 1,000 to 20 000 C.G.S. units, it is given by 10 to 200 microwebers per sq. cm.

Gaussage would be about 50 in small transformers, up to 40,000 in large dynamos. The latter could be conveniently reckoned in kilogausses. To make the gauss = 1 ampere-turn appears to have great advantages in practice and connects it directly with its usual source.

The idea of permeance is very useful, and the identification of its dimensions with those of inductance is neat. But I think it is liable to cause confusion, for the permeance of the core of a coil will be a different number of henrys from the inductance of its wire. Moreover, the argument as to identical dimensions might equally be applied to the case of amperes and gausses. I would therefore have a new unit strictly connected with the henry, so that inductance $= n^2 \times$ permeance in a coil of n turns.

As to the units of permeance: with the above meanings of gauss and weber the permeance of a circuit would be $4\pi\ \mu\ A / 10l$, as you point out, instead of $\mu\ A / l$. I suggest a change in the method of reckoning, namely, still to retain the value of the permeance as $\frac{\text{webers}}{\text{gausses}}$, and permeability as $\frac{\text{webers per sq. cm.}}{\text{gausses per cm.}}$, therein giving up the convention of unit permeability of space, and giving it the value 1.2566×10^{-8} unit of permeance for a unit cube. In this way both the troublesome 10^{-8} and $4\pi / 10$ are dealt with in an easily intelligible way. To avoid the high power of 10 it may be measured in micro-units of permeance, so that permeability of space and air = 0.012566 micro-unit of permeance for a unit cube, and permeability of soft iron = up to 25 micro-units for a unit cube. Thus we have permeance $= A\mu / l$, where μ is to be obtained from tables of its value, which can easily be altered to this method. Inductance then becomes

$$\frac{\text{weber-turns}}{\text{amperes}}, \text{ or } n^2 \frac{\text{webers}}{\text{gausses}} = n^2 \text{ permeance.}$$

[Of course your phrase "weber-turns per ampere" means the same as the above webers ÷ amperes and does not necessarily mean the weber-turns caused by *one* ampere.]

It may be objected that the C.G.S. units of strength of field unit magnetic pole and intensity of magnetization do not bear any simple relation to these practical units. This is chiefly important in the use of the magneto-metric measurement of iron, and in the measurement of the mechanical form of attraction between two magnetic surfaces in contact. But the expressions are not in reality much complicated; *e.g.*, present C.G.S. unit of intensity of magnetization is given by $4\pi\ I = (\mu - \mu_0)\ H$, where μ = permeability of space = 1 and H = C.G.S. unit of magnetic force. This becomes $4\pi\ I = (\mu' - \mu'_0)\ H'\ 10^8$, where H' is the gauss-gradient in the magnetic substance, and $\mu'_0 = 0.012566$ micro-unit of permeance for a cubic centimeter.

As the single magnetic pole is unchanged, the force on it will be = strength of pole × gauss-gradient × 1·2566; but as this is not a calculation of frequent occurrence except in magnetic surveys, the complication will not be serious. Other magnetic relationships are almost entirely of academic interest only, and would be carried out in C.G.S. units. Also the transition would present no difficulties to people with a little scientific knowledge.

I am of opinion also that as the legal volt has no direct connection with induction and velocity of motion, it is not necessary to define the practical units as they are defined absolutely. That is, ohm and ampere are the starting points, volt is obtained from them, weber from volt, gauss from ampere permeance unit from weber and gauss, henry from weber and ampere or from permeance, and so on. This is much more easily explained to practical and unscientific men than the absolute derivations are, and it is the order in which they learn them. Yours very truly,

FRANCIS G. BAILY.

APPENDIX II.

Another subject for discussion is whether L had better not be defined as $d\,N / d\,C$; with permeability as $\mu = d\,B / d\,H$ to correspond.

This would make the three equations of page 7 stand thus:

$$(1)\ N = \int L\,d\,C,$$

$$(2)\ E = L\,\dot{C},$$

$$(3)\ W = C\,\dot{N}.$$

A letter just received from Mr. Heaviside indicates that he would probably favor this course, and there is evidently much to be said for it. I need hardly add that he contemns my temporizing method of dealing with the 4π nuisance.

O. J. L.

January 30, 1895.

According to the proposal of the Chicago Chamber of Delegates, the quantity which we call "inductance" and which is to be expressed in "henrys" is defined by the equation $E = L\ (d\,C) / (d\,t)$ for self-induction, or $E = M\ (d\,C) / (d\,t)$ for mutual induction, both being comprehended in one definition, the inductance L or M being calculated by dividing E in volts by $(d\,C) / (d\,t)$ in amperes per second. This implies that L or M is not to be defined as N / C, but as $(d\,N) / (d\,C)$. [redacted]

I think names are desirable both for N / C and for $(d\,N) / (d\,C)$. I would suggest that the former be called "the total inductance" and the latter "the differential inductance." The distinction would be somewhat analogous to the distinction between the "mean specific heat from 0° to t°" and the "true specific heat at t°." Both total and differential inductance should be expressed in "henrys," for they are quantities of the same kind and when there is no iron, etc., in the field they are equal.

I think that the above mode of definition, involving as it does no magnitudes except current and time, is more readily comprehended than Dr. Lodge's proposed definition, in which the magnitudes involved are current, flux of induction, and the number of convolutions of the coil through which the flux passes. In the definition proposed by the Chicago Delegates, the consideration of the number of convolutions does not enter.

For a circuit or two circuits not having iron, etc., in the field, we may define inductance (in henrys) as the E.M.F. (in volts) due to variation of current at unit rate (one ampere per second). When the field is modified by the presence of magnetic material, the above will be the definition of "differential inductance."

The "total inductance" for any specified strength of current will be the mean value of differential inductance for equal increments of current from zero up to the specified strength.

I would suggest similar nomenclature in the case of permeability; $(d\,B) / (d\,H)$ should be called differential permeability, and B / H total permeability. In some respects "mean" or "average" would be a more correct designation than "total"; but these words would be liable to be misunderstood as referring to an average taken over the different parts of the body or circuit. "Total" is to be understood as standing for "calculated on totals."

As regards the magnitude of the unit of inductance, while I agree with Mr. Heaviside and Dr. Lodge that the unit pole ought to have been so defined that the mutual force between two poles is equal to their product divided by the surface of a sphere whose radius is their distance, a definition which would have made the line-integral of H due to a current C equal to C itself instead of to 4π C, I deprecate a mixing up of the two systems. So long as we employ our present unit of intensity of magnetic field, which results from our present definition of the unit pole, we cannot consistently reckon the line-integral as equal to the ampere-turns. It must be reckoned as 4π times the ampere-turns, and the flux N must be reckoned as $4\pi\ \mu$ times the ampere-turns. The practical inconvenience of retaining the factor 4π cannot be considerable, for it is as easy to tabulate the values of $4\pi\ \mu$ as the values of μ.

Next as regards "permeance." I do not think it can conveniently be reckoned in henrys. I would rather reckon it in "webers per ampere-turn," which would be written "web. per amptu."; and there can be no possible doubt as to the meaning intended when once we have fixed the magnitude of the "weber." There seems to be no difference of opinion as to what this magnitude should be. It is fixed by the relation $E = (d\,N) / (d\,t)$, E being in volts, N in webers and t in seconds. This is in accordance with Dr. Lodge's proposal, but Dr. Lodge has not explicitly recommended any name for the physical quantity which is measured in webers. Shall we call it "weberage"? It greatly needs a name; for "induction" may mean B instead of the surface integral of B, besides having many other meanings.

When permeance varies according to the strength of current, I would distinguish between "total permeance" $N / (n\,C)$ and "differential permeance" $\frac{1}{n}\frac{d\,N}{d\,C}$.

As regards "gaussage" and "gauss fall," I think the names will be convenient in the senses proposed by Dr. Lodge; but I cannot agree with his selection of a unit of measurement. The present definition of the unit pole (on which the present unit current is based) requires us to equate the line-integral in question to $4\pi\,n$ C. To be consistent we must reckon "gaussage" as equal to 4π times the number of amptus. Dr. Lodge's proposal is to reckon C not in amperes but in C.G.S. units, thus introducing, as it appears to me, an awkward breach of continuity.

J. D. EVERETT.

*From the *Electrician* (London).

The Electrical Device for Killing Weeds.

A correspondent (E. V.) wishes to know if the electrical weed-killing device described in ELECTRICITY, May 15, is patented, and if so, who holds the patent and where is the machine manufactured. Our description was based on a floating paragraph in a Western paper. If we are not mistaken, the Illinois Central Railroad experimented satisfactorily with some such device.

GENERAL ELECTRIC'S FINANCING POLICY.

Northwest General Electric—The Scheme, the Companies Financed, the Facts and Figures from the Official Record

H W BONDS ARE MANUFACTURED FOR NEW ENGLAND INVESTORS.

CHAPTER XII.

The Faribault Plant.

The establishment of an electric lighting plant at Faribault, Minn., was one of the earlier operations of the Northwest Construction Company before the name of that company was changed to the Northwest Thomson-Houston Company.

The town of Faribault is situated in Rice county, and had in 1890 a population of 6,520. It has no special advantages over any other town of similar size in that section. The extent of the business done there may be fairly judged from the number of banks it has and their capital, which is as follows:

	Capital.
Citizens' National	$80,000
First National	50,000
Security Bank	50,000
Total capital	$180,000

This was the town chosen by Mr. E. R. Gilman and Mr. C. A. Coffin for the establishment of an electric light plant in 1887, and for one of their earliest stock and bond operations in partnership. No local capital was interested, and the entire scheme, as at Mitchell, was carried through by the Northwest Company, or by the officials of that company. A copy of the original ordinance granting to Mr. E. R. Gilman a ten-year franchise is given herewith, as is also a copy of the articles of incorporation of the Electric Light and Power Company which was to operate under the franchise. The incorporators, Daigh, Turner and Tayloe, were all salaried employés of the Northwest Construction Company.

It will be noted that the original capitalization was placed at $100,000. The books of the company show, however, that Mr. Gilman invested only $1,600 in the electric light plant. Even on this small investment the plant did not pay, and Gilman decided to buy the established gas plant and make a grand consolidation. He secured the money, paid $20,000 for the gas plant, and then formed the Faribault Consolidated Gas and Electric Company, the articles of incorporation of which appear herewith. Here again

---

[COPY].

Number Seventy-Four (74).

An ordinance relating to electric lights.

The Common Council of the city of Faribault do ordain:

Section 1. E. R. Gilman or his assigns shall have for the period of ten years (10) years from and after the passage of this ordinance, the exclusive right and privilege of erecting and maintaining in and along the public streets, highways, alleys and squares of said city, in such manner and at such places as the Common Council of said city shall sanction and approve, the necessary poles, towers, wires and other conductors for supplying said city and its inhabitants with electric lights,

Provided that the said E. R. Gilman and his assigns shall have his or their works and apparatus in operation ready to supply said lights within one hundred (100) days from the passage of this ordinance, and

Provided further that the said E R. Gilman and his assigns shall keep said works in operation continuously, supplying said lights for and during the aforesaid full term of ten (10) years, except in case of accident to said works, in which case the same shall forthwith be put in full operation with all due diligence by the said E. R. Gilman or his assigns, and

Provided further that the said E. R. Gilman and his assigns shall, at all times during the aforesaid term of ten (10) years, furnish said lights to said city and its inhabitants at reasonable rates, regard being had to the price at which electric light of the same quality is or may hereafter be furnished in other cities under similar circumstances, and shall at all times during said term furnish said lights for the public lighting of said city, if requested by the city, at a rate not to exceed fifty (50c.) cents for each arc light for the whole of each night, and

Provided further that the said E. R. Gilman or his assigns shall, during said term, use upon and introduce into said works and apparatus all devices, inventions and improvements which the Thomson-Houston Electric Light Company now controls or uses elsewhere or which the said company, its assigns or successors in interest in such devices, inventions or improvements, may hereafter, during said term, control or use as soon as the said company controls or uses them elsewhere, and shall, during said term, operate said works as efficiently and furnish as good quality of light as the said Thomson-Houston Electric Company, its assigns or successors aforesaid, shall elsewhere, during said term, operate and furnish, and

Provided further that neither said E. R. Gilman or his assigns shall, at any time or in any manner, unnecessarily obstruct, impair or injure any of said streets, highways, alleys or squares, and that they shall immediately, after erecting their said poles, towers, wires and other conductors, or in making any extensions, repairs or improvements thereon, restore such streets, highways, alleys and squares to as good condition as the same were previously in, and shall so erect, manage and operate his or their said works, poles, towers and other apparatus as not to interfere with any rights or privileges heretofore granted by the Common Council of said city to any other individual, co-partnership or corporation and shall, during all said term, have an authorized agent in said city upon whom summons and process may be served, and shall be liable and respond for all damages caused or done by said E. R. Gilman and his assigns, and his and their agents and employees in constructing, repairing, extending, improving or operating any of his or their said works, poles, towers or other apparatus, or resulting therefrom, and shall save the said city harmless from all such damages and liabilities, and

Provided further that the said E. R. Gilman and his assigns shall, in all things, keep and perform each and every contract which he or they may hereafter enter into for supplying said city with said lights, and

Provided further that the said E. R. Gilman and his assigns shall extend their lines to and furnish electric light at such points within the limits of said city as the Common Council may direct, whenever there is a demand for not less than an average of six (6) arc lights per mile of wire.

Section 2. The construction of said works, poles, towers and other apparatus in said city by the said E. R. Gilman or his assigns, shall be an acceptance of this ordinance and of all the conditions and provisions herein contained. If the said E. R. Gilman and his assigns shall fail to fully keep, perform and comply with all and singular the provisions and conditions herein before contained, the rights and privileges hereby granted shall thereby determine and lapse forthwith without any act to be done by the said city.

Section 3. Ordinance No. 59, entitled "An Ordinance Relating to Electric Light," passed March 3d, 1885, and

Ordinance No. 65, with the same title passed March 8th, 1886, and

Ordinance No. 68, with the same title, passed March 3d, 1887, are hereby repealed.

Section 4. This ordinance shall take effect and be in force from and after its publication.

Passed July 26th, A.D. 1887.

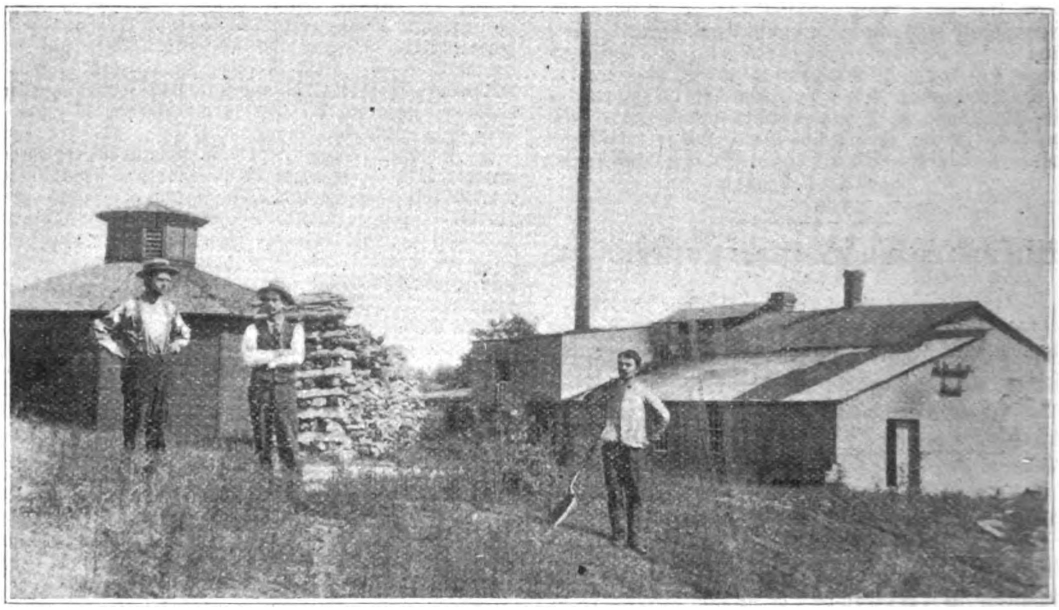
A. H. HATCH,
Acting Prest. Com. Council.

Attested:
A. A. MURPHY, Deputy City Recorder.
Approved July 28th, A.D. 1887.
A. H. HATCH, Acting Mayor.

I hereby certify that the foregoing is a true copy of the ordinance now of record in my office; that I have carefully compared the same and believe the same to be correct.

Witness my hand and official seal this 20th day of July, A.D 1889.

[Seal] D C. TURNER, City Recorder.



SUPT. JOHN HAUG. HERMAN POFFAHL.

VIEW OF STATION, FARIBAULT CONSOLIDATED GAS AND ELECTRIC CO. (CAPITALIZED AT $200,000).

[COPY.]

ARTICLES OF INCORPORATION

OF THE FARIBAULT ELECTRIC LIGHT AND POWER COMPANY.

In order to become a corporation under and by virtue of the laws of the State of Minnesota, the undersigned mutually agree and each hereby adopt and sign the following articles, herein stipulated, of incorporation:

Article First—The name of this incorporation, and under which it will trade, is the "Faribault Electric Light and Power Company," and its principal place of business shall be in the city of Faribault, in the county of Rice and State of Minnesota.

Article Second—The general nature of the business of this incorporation shall be to furnish electricity for light, heat and power, and all that pertains to said electricity, and to own property, real, personal or mixed, taken as security or on foreclosure, in payment of indebtedness, due or to become due, to the said corporation or otherwise, and wherever such property may be situate.

Article Third—The said corporation shall commence on the 1st day of January, 1889, and continue for thirty (30) years from date of incorporation; and the annual meetings shall be held on the 2d Monday in January in each year from and after date.

Article Fourth—The amount of capital stock of said corporation shall be fifty thousand ($50,000) dollars, consisting of five hundred shares of the par value of one hundred ($100) dollars each, and shall be paid in as subscribed and called for by the Board of Directors, but said corporation may go into operation and transact business pertaining to said corporation whenever 100 shares of stock shall have been subscribed for and actually taken. The highest amount of indebtedness and liabilities to which said corporation shall at any time be liable or subject shall be fifty thousand ($50,000) dollars.

Article Fifth—The names and residence of the persons forming said corporation are C. A. Daigh, residing in St. Paul, Minnesota; H. W. Turner, residing in St. Paul, Minnesota, and W. R. Tayloe, residing in St. Paul, Minnesota.

Article Sixth—The government of this corporation and the management of its affairs shall be vested in a Board of Three (3) Directors, to be chosen by the stockholders at the annual meeting, and such Directors shall hold office until their successors are elected and qualified. The Directors from their own number shall select a President, Vice-President, General Manager, Secretary and Treasurer, and any three offices may be held by the same person.

Article Seventh—The names of the first Board of Directors are as follows: C. A. Daigh, residing in St. Paul, Minnesota; H. W. Turner, residing in St. Paul, Minnesota, and W. R. Tayloe, residing in St. Paul, Minnesota.

In witness whereof we have hereunto set our hands and seals this 14th day of December, 1888.

C. A. DAIGH. [Seal]
H. W. TURNER. [Seal]
W. R. TAYLOE. [Seal]

Signed and sealed in presence of
M. R. JONES.
HAYDN S. COLE.

State of Minnesota, County of Ramsey, ss.

Be it known that on this 14th of December, A. D. 1888, before me, a Notary Public, duly commissioned in and for said Ramsey County, personally came C. A. Daigh, H. W. Turner and W. R. Tayloe, to me personally known to be the identical persons who signed and sealed the foregoing articles of incorporation, and each then and there severally acknowledged that he signed and sealed said articles as his free act and deed.

Witness my hand and official seal.

W. G. DE CELLE, Notary Public,
[Notarial seal] Ramsey County, Minnesota.

Office of Register of Deeds, Rice County, Minn.

This instrument was filed for record the 19th day of December, A. D. 1888, at the hour of 11 o'clock A. M., and was duly recorded in Book "D" of M. R., page 342.

JAMES HUNTER, Register of Deeds.

Filed in this office for record December 20, A. D. 1888, at 9:50 o'clock A. M.

H. MATTSON,
Secretary of State.

State of Minnesota, Department of State.

I, Albert Berg, Secretary of State of the State of Minnesota, do hereby certify that I have compared the annexed copy with record of the original instrument in my office of articles of incorporation of the "Faribault Electric Light and Power Company," as filed December 20, 1888, and recorded in Book "D" of Incorporations, page 351, and that said copy is a true and correct transcript of said record of said original instrument and of the whole thereof.

In testimony whereof I have hereunto set my hand and affixed the great seal of the State, at the Capitol in St. Paul, this 4th day of September, A. D. eighteen hundred and ninety-five.

ALBERT BERG,
[State seal.] Secretary of State.

we find only the names of the Northwest Company's *employés* as incorporators. The capitalization was increased to $200,000, and the gas plant was slightly remodeled to make room for the electrical apparatus.

[COPY.]

ARTICLES OF INCORPORATION

OF THE FARIBAULT CONSOLIDATED GAS AND ELECTRIC COMPANY.

Be it known that the undersigned do hereby associate themselves together for the purpose of forming a corporation under the provisions of title two (2) of chapter thirty-four (34) of the General Statutes of the State of Minnesota, for the year A. D. 1878, and the acts amendatory thereof and supplementary thereto, and to that end have and do hereby adopt the following articles of incorporation:

ARTICLE I.

The name of this corporation is the Faribault Consolidated Gas and Electric Company.

The general nature of its business shall be to manufacture, generate, transmit, furnish, rent and sell gas and electricity for light, heat and power, and for all that pertains to said gas and electricity for public and private use.

The principal place of transacting the business of said corporation is the city of Faribault, in Rice County and State of Minnesota.

ARTICLE II.

The time of commencement of this corporation shall be the first day of October, 1889, and its period of continuance thirty (30) years.

ARTICLE III.

The amount of capital stock of this corporation shall be one hundred thousand ($100,000) dollars and shall be issued and paid for in such manner and at such times as the Board of Directors may determine.

ARTICLE IV.

The highest amount of indebtedness to which said corporation shall at any time be subject shall be one hundred thousand ($100,000) dollars, and it may borrow money at such times and upon such collateral and security as its Board of Directors may deem best.

ARTICLE V.

The names of the persons forming this corporation are: Edward R. Gilman, Wilford G. De Celle, Haydn S. Cole, George C. Duffie and Harry W. Turner, and the place of residence of each of said incorporators is the city of St. Paul, State of Minnesota.

ARTICLE VI.

The government of said corporation and the management of its affairs shall be vested in a Board of not less than three (3) or more than five (5) Directors, each of whom shall be a stockholder and shall hold office for one year and until his successor is duly elected and qualified.

The Directors shall be elected at the annual meeting of the stockholders on the first Tuesday in October of each year, commencing with October, 1890.

The Board of Directors shall, on the first Tuesday in October of each year, commencing with October, 1890, immediately after the annual meeting of the stockholders, elect a President, Vice-President, Secretary, Treasurer and such other officers as may seem to them necessary, and more than one office may be held by the same person.

The powers and duties of the President, Vice-President, Secretary, Treasurer and other officers or agents shall be such as the by-laws shall prescribe, and the Directors shall have power to make all needed by-laws and regulations for the management of the affairs of said corporation.

The names of the first Board of Directors are: Edward R. Gilman, Haydn S. Cole and Wilford G. De Celle, and until the annual meeting of stockholders in October, 1890, the officers or agents shall be the persons whom the first Board of Directors shall elect at their first meeting, and the officers shall hold office for one year and until their successors are elected and qualified.

Vacancies in the Board of Directors or in any office may be filled by the Directors for the unexpired term.

ARTICLE VII.

The number of shares in the capital stock of said corporation shall be one thousand (1,000) and the amount of each share shall be one hundred ($100) dollars.

In testimony whereof the undersigned have hereunto set their several hands and seals this 21st day of September, A. D. 1889.

EDWARD R. GILMAN. [Seal]
WILFORD G. DE CELLE. [Seal]

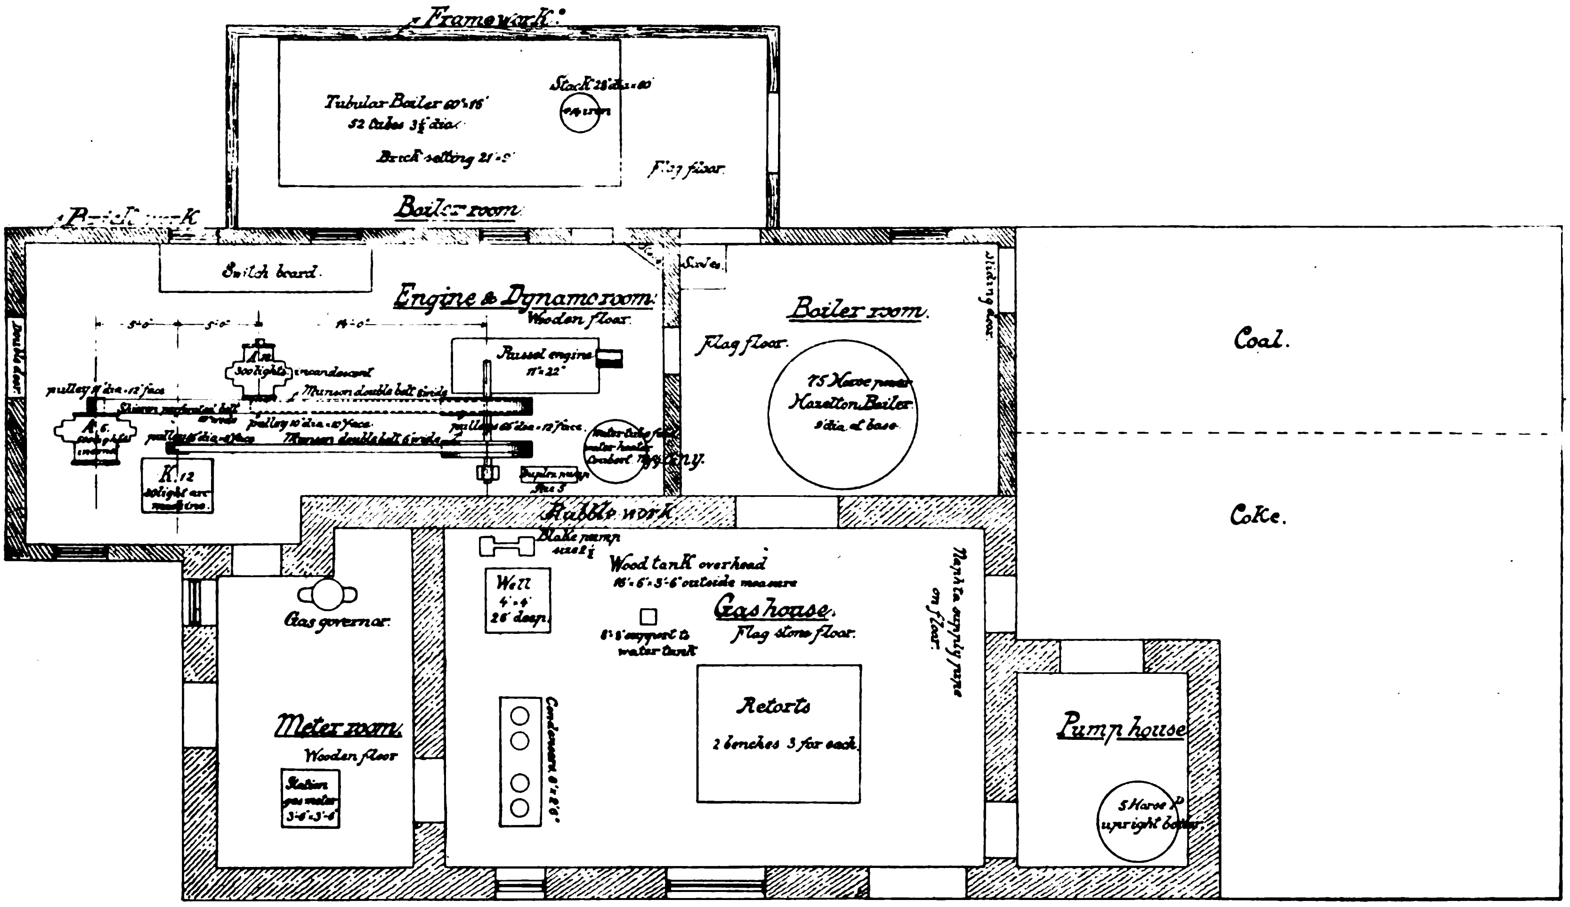
I, Albert Berg, Secretary of State of the State of Minnesota, do hereby certify that I have compared the annexed copy with record of the original in my office of articles of incorporation of the Faribault Consolidated Gas and Electric Company, and that said copy is a true and correct transcript of said articles and of the whole thereof.

In testimony whereof I have hereunto set my hand and affixed the great seal of the State, at the Capitol in Saint Paul, this fourteenth day of September, A.D. eighteen hundred and ninety-five.

ALBERT BERG,
[State seal] Secretary of State.



Plan of Faribault Consolidated Gas and Electric Company's Plant.

Mr. Gilman "retained" all the stock and part of the bonds. Some of the latter were sold to Mr. Gilman's father at par and $20,000 to an old army officer in Baltimore who is supposed to still hold them. The magnitude of this consolidated plant is shown clearly by the accompanying reproduction of a photograph taken after all improvements were made. On the right is the electric light station and on the left appears the gasometer. We also give the plan of the station from the official drawings.

The gas plant was profitable in a small way, and Mr. Gilman managed to carry the thing along until he terminated his connection with the Northwest Thomson-Houston Company in the fall of 1890. The electric plant had never earned expenses, but of course all supplies needed were furnished by the Northwest Company from St. Paul, on credit.

Mr. Gilman's version of his connection with the enterprise is found in the following extract from a communication addressed by him to the directors of the Northwest Thomson-Houston Company under date of November 6, 1890:

> Sixth—I desire to call attention of the Board of Directors to the Faribault Consolidated Gas and Electric Company. This plant is one the writer became personally interested in in order, largely, to bring about a consolidation of the electric light company and the gas company. This company is the owner of the old electric light company, an institution which was constantly running behind and was of but little value to us until the consolidation was made. The plant is bonded for $75,000, an amount somewhat in excess of its actual cost to the new company, although an amount materially less, I am informed, than the plant originally cost. It was the intention of the parties purchasing the plant to add materially to the gas works.
>
> These plans have been partly carried out. A new steam plant has been added; the circuits have been extended and many improvements have been made. But it is also necessary to remodel the gas works, which will require an expenditure of about $20,000. It was the intention to sell these bonds and with the proceeds to largely pay for these extensions. Inasmuch as the contemplated extensions have not been made, however, and inasmuch as I am now in possession of the entire plant, I feel it no more than justice to the Northwest Company to place a few of these bonds with the trustee to be held to pay for these extensions when they occur. I also take pleasure in delivering to the Northwest Company $17,500 of the common stock of the Faribault Company without consideration. I think it no more than right that they should have this portion of the stock inasmuch as the stock has cost the original purchasers nothing, although the Northwest Company should well be satisfied with simply obtaining the bonds in place of the old electric plant which it had and which was of very little value to the company. Nevertheless, inasmuch as I now own the plant, I am desirous of doing what will be much more to the advantage of the company than to myself, so that it cannot be said but that the Northwest Company has made more out of the consolidation than any-one else, and for this reason I turn over this stock to the company without consideration, agreeing to put $15,000 of the bonds into the hands of the trustee to be held for extensions.
>
> Finally, regarding the plant, I will state that I shall be

glad to have the company purchase the same from me for the actual amount of money invested, plus 8 per cent. interest, as shown by vouchers.

This I do because I wish the company to understand that I have made nothing out of the plant, and that the main object I had originally in engaging in it at all was to better the security of the company. I would have had the company buy the gas works at the time, but they did not have the money to do so. I was obliged to get other parties to take an interest in the matter, and they afterward became dissatisfied with the investment, so they came back on me and asked me to take the investment off their hands, which, I regret to say, I felt obliged to do. In other words, therefore, I am in this investment against my wishes. I have heard incidentally that some of our stockholders have thought I ought not to be interested in any local plants, and I fully agree with them. I am interested in but two plants, however, one at Miles City, Mont., and the one at Faribault, and if the company will pay me what I have put in either or both of these deals I will gladly sell out.

The Miles City company I was interested in before my connection with this company at all, and the Faribault company I engaged in for the direct benefit of the Northwest Company, and by so doing I have given them a good piece of property for what otherwise would have been a worthless piece.

I make this explanation in order that it may be put upon the records of the company, and so that the matter may not be misunderstood.

The above was written at the time when the St. Paul directors of the Northwest Company were protesting against Gilman's mismanagement and while Mr. Coffin was trying to arrange some plan whereby Gilman might continue to give his valuable talents to the service of the company. Mr. Gilman's remark, that "the old electric light company was constantly running behind," bears out the official records. While his statement has the appearance of frankness it does not bear analysis. The steam plant *had been* renewed, as the original boilers had given out in less than three years. Mr. Gilman was "interested" in the sale of Hazleton boilers and had put them in wherever possible in all the Northwest stations. His offer to give $17,500 of stock to the Northwest Company was certainly generous, as it had no value, but was rather a detriment to the owners.

Just how "good" the property was which Mr. Gilman refers to in his closing paragraph will develop as we proceed with our analysis.

Mr. Gilman retired from the Northwest Thomson-Houston Company soon after the above was written, and a few months later Mr. Byllesby took charge of the fortunes of the company and of its many plants and bond schemes.

In the settlement with Mr. Gilman, all the stock of the Faribault Consolidated Gas and Electric Company was turned over to the Northwest Thomson-Houston Company, and nearly all of the bonds to Mr. C. A. Coffin, who still holds them. For some time after Mr. Byllesby came in the plant was so manipulated, getting credit from the Northwest Thomson-Houston Company, and actual advances of cash, that Mr. Coffin was enabled to draw interest on his bonds, which he did. It is thus seen that the original intention to unload $200,000 of the securities of this plant upon the public miscarried. Meantime the worthless plant has appeared as an asset on the books of the Northwest General Electric Company, supplies sold to it on credit, and never paid for, have gone to swell the gross annual business of the General Electric Company, and the "exploiting" work of Mr. Coffin and his assistants is again exemplified.

No records were kept of the operations of the plant until 1892. When the company needed money it was advanced by the Northwest Company, and when it needed supplies they were shipped. We present herewith a copy of the first trial balance made up after records were kept. As will be shown next week, the item of "Electric plant, $1,243.99," plus the item of "Notes payable, $12,360.87," covers the actual cost of the electric plant up to the date on which this trial balance was made, taking into consideration the losses in operation. The gas plant was not valued in this statement. The amount put down for "Interest on notes, $237.82," is the amount of interest actually paid, not what was due. It was the custom of the Northwest Company to add the amount of interest which its local companies were unable to pay to the new notes which were given from time to time and discounted. For the purposes of such discounts the Northwest Company had on its list no less than twenty banks scattered over the country, the total of its discounted paper, of this character, running up to over $2,000,000.

[COPY.]

FARIBAULT CONSOLIDATED GAS AND ELECTRIC COMPANY.

TRIAL BALANCE FOR TWELVE MONTHS ENDING APRIL 30, 1893.

Electric plant	$1,243.99	
Wiring	91.92	
Street lines and wiring	3,998.60	
Tools and fixtures	25.87	
Profit and loss	85.81

" " electric plant	153.05	
" " gas plant	255.49	
Carbons	25.05	
Water	12.07	
Insurance	305.00	
Discount	72.00	
Rent	25.00	
Interest on bonds	4,500.00	
" " notes	237.82	
		$23,072.16
Credits.		
Notes payable	$12,360.87	
Earnings	10,711.29	
		$23,072.16

We shall leave for the succeeding chapter an analysis of the value of the property owned by the Faribault Company and a comparison of the amount of securities actually issued, $175,000. The trial balance above shows that in the four years up to April 30, 1893, the company had run up an indebtedness of over $12,000. The best record made for earnings was for the year ending April 30, 1893, and we present the official statement for that year.

[COPY.]

FARIBAULT CONSOLIDATED GAS AND ELECTRIC COMPANY.

STATEMENT OF EARNINGS AND EXPENSES FOR TWELVE MONTHS ENDING APRIL 30, 1893.

Earnings.

	Inc't.	Arc.	Gas.	
May	$181.37	$148.44	$404.80	
June	185.49	148.44	367.48	
July	187.79	163.77	307.38	
August	186.08	152.77	426.14	
September	225.60	152,77	326.67	
October	249.18	147.44	536.24	
November	268.71	143.44	585.49	
December	375.83	119.15	603.96	
January	445.91	100.00	646.23	
February	445.90	102.00	482.18	
March	444.00	102.00	420.48	
April	446.91	135.00	346.25	
	$3,642.77	$1,615.22	$5,453.30	$10.711.29
Net profit from wiring				456.65
Total earnings				$11,167.94

Expenses.

Salaries of officers and clerks	$1,498.00	
" " engineer and fireman	1,241.32	
Fuel, (less inventory)	2,223.03	
Coke, " "	709.21	
Naphtha, " "	311.71	
Insurance	305.00	
Taxes	275.97	
Lamps (less inventory)	167.32	
General expense	428.14	
Repairs to gas plant	255.49	
" " electric plant	153.05	
" " steam plant	39.07	
Oil and waste (less inventory)	31.81	
Carbons	25.05	
Discount	72.00	
Legal expense	25.00	
Traveling expense	19.64	
Water	12.07	
Rent	25 00	
		$7,817.88
Surplus for twelve months		$3,350.06

This shows an apparent surplus from operations of $3,350.06. The bonds of this company bore 7 per cent. interest, and the lowest rate obtainable for discounts was 10 per cent. We are able, therefore, to show what the full results of the year's operations were by the following table:

The fixed charges were:	
Interest on $75,000 bonds at 7 per cent	$4,500.00
Interest on notes, $12,360.87 at 10 per cent	1,236.08
Total	$5,736.08
Deduct surplus from operation	3,350.06
Deficit	$2,386.02
And to show how far the plant fell short of being a sound enterprise we must add:	
6 per cent. depreciation on cost of plant, $21,600	$1,296.00
6 per cent. interest on stock, $100,000	6,000.00
Total deficiency for one year	$9,682.02

(*To be continued.*)

An Electric Pen.

Mr. F. W. L. Sladen, of Riple Court, Ringwould, Dover, is the inventor of an electric pen which will, no doubt, be the forerunner of improvements enabling such inventions to be used in a greater variety of ways than the appliance before us is at present intended to accomplish. There are really two forms of pen—a coil pen, which consists of a loop of steel wire at the writing-point, round which is coiled ¼″ of the London Electric Wire Company's "Platinoid" wire, .002″ diameter. This is covered with insulating material, and the current heats the platinoid by passing through it, and the steel loop by conduction of the heat. With a small dry cell the resistance of this pen when working is about 6.1 ohms, and the current registered about 250 milliamperes.

The other pen-point consists merely of a steel loop, through which the current passes, warming it to the requisite point. This form requires about 3 amperes of current, and can be worked from the lamp wires.

Mr. Sladen has sent us some specimens of work done by his electric pen, both illustrations and reading matter produced being exceptionally clear. We understand from Mr. Sladen that his invention is not yet on the market, but that he is open to treat with manufacturers for its production and sale. The only public exhibition, so far, of the capabilities of the pen was given a few weeks ago in Edinburgh before a company of electrical experts, who recognized its value as an autographic duplicating agent. The modus operandi is as follows: An electric current passed through the pen from a small dry cell, has the effect of warming the steel loop to a temperature somewhat above the fusing-point of wax, and the pen, being then applied to a thin sheet of porous Japanese paper coated with wax, melts the wax as it is guided by the hand of the writer, and the sheet is thus transformed into a stencil open for the transmission of ink. The stencil sheet is then fixed in a frame, and by the aid of an inking roller in the usual way copies of the original writing may be taken to practically an unlimited extent. Lines of any thickness may be made without fear of limiting the number of copies which the stencil is capable of throwing off, and the invention is not confined to letter copying alone, as in the case of existing kindred processes, but may be used with great advantage for illustrations of all kinds. The whole apparatus is contained in a small compact box, and the cost of the article, it is claimed, is considerably below that of the ordinary stencil copyers. The experiments appeared to give the utmost satisfaction.—*Electrical Plant* (London).

LEGAL NOTE.

Patent Allowed on Flexible Mica.

The Board of Appeals of the United States Patent Office has just reversed the decision of the Primary Examiner and has granted the right to protection upon what is appropriately and conveniently termed "flexible mica" for insulation, recently introduced by the Mica Insulator Company, of 218 Water street, New York City.

Personal.

Mr. Frank Judson Pope, who graduated from Columbia College in the class of '95, has followed somewhat in the footsteps of his father and begins newspaper work on the staff of the *Evening Sun* of this city.

Mr. H. T. Richards, who is well and favorably known in this trade through his long connection with the *Electrical Review*, has taken a position with the New York Safety Insulated Wire and Cable Company.

Mr. F. H. Horne, one of the old-time salesmen, who is widely known in the East, left Chicago last week for Japan, sailing from Vancouver on the Empress of China of the C. P. R. Company's line.

Is a Freight or Mail Service Profitable or Unprofitable on Street Railways?*

BY BENJ. F. NORTON.

The simplest answer to this question is, yes, if it can be performed at a profit; and no, if it must be performed at a loss. Now, apparently, the question is solved, and I have no further need to discuss it. But as this is a subject which will eventually be taken up seriously by most electric railway companies, it is worthy of very careful consideration.

On a street railway which has no suburban outlet and no direct or close connection with some other line which operates or can conveniently operate a freight service, it might be a very unprofitable venture to undertake this class of traffic. To-day, however, there is hardly an electric railway (and we will speak of electric roads only now, since horse power is a thing of the past,) which does not have suburban outlets or chances for them. Therefore we may safely say that a freight service as a general rule ought to pay. Very few companies thus far have branched out into this field, and as I happen to be interested heavily in a line which has gone vigorously into the matter, I can tell briefly our experience, and can show you what a successful feature of our business the freight branch of it is; so much so that we have a regularly organized freight department, waybilling merchandise in regular steam railroad fashion and running regularly scheduled freight trains, all of which pays handsomely.

This line grew out of a tumble-down horse railroad in the city of Newburg, and after being rebuilt and extended and equipped electrically, we found ourselves tapping the rich Walkill Valley at Walden, twelves miles away, and terminating at the front door of one of the largest cutlery works in this country, running by all the stores and shops in town, and giving an opportunity besides to dairymen of Orange County to get their milk, butter and cheese to boats on the Hudson River at Newburg inside of an hour, when formerly they had carted it the distance over the rough country roads, the teamsters spending pretty much the day at it and returning home at night with their mule teams tired out and often a broken-down wagon.

This line to-day, because it is a short-cut in the first place, and because goods can be transported at low rates in the second place, is handling the dry goods and other merchandise for Walden merchants, shipped from New York to Newburg by boat; the raw material for the cutlery works, in the way of steel, brass, wood and other supplies, and bringing back manufactured material; in cases, hay, straw and fruit; and condensed milk in cans from the Borden condensery, only two miles from our terminus at Walden. The road runs along the highway in some portions, and at other points the line is set well back from the roadway on independent property; and the farmers hustle their hay and straw in bales out the side gate to the track and stop the freight car handily, saving (besides 50 cents to $1.00 per ton freight) a long drive to the steam road freight house.

In the month of August the operating cost for handling our freight was a trifle over 40 per cent. of the gross receipts. We ran three motor freight cars, carrying from 8 to 12 tons each, and four flat or gondola cars as trailers, carrying from 6 to 8 tons each. At Newburg the line runs alongside the stringpiece of the steamboat dock, so that everything can be easily skidded between the boats and cars. We also run close to the Erie and West Shore freight houses and tracks, ensuring an all year round New York connection, although as a rule the Ramsdell line of boats is out of service but one month in the year.

Some of our Walden friends remarked the other day that the Walkill Valley railroad people had soured on the trolley, because their freight trains in both directions were running through Walden without stopping, and they were discussing the notion of discharging their freight agent at that point. I may add that the past week we have hauled from Walden to the Hudson River, among other kinds of freight, about 75 tons of grapes, and the coming week we will do the same. The rate of 13 cents per hundred pounds net to us makes $2.60 a ton, which is a good rate, and requires but one trip per day of a motor freight car and trailer to get it. To earn the same amount of money with passengers would take the entire day and a regular full day crew besides.

The experiments now being made by the New Haven Railroad people on their Nantasket Beach road are probably not new to you, and it looks very much as though freight business on electric roads would not only be profitable in the near future, but generally adopted as a means of revenue by a large percentage of such companies.

As to mail contracts, while the Government compensation is comparatively small, the actual cost to a company for performing the service is so little that they must be profitable to a certain extent, but aside from this no large corporation in a large city where the circumstances call for such a contract should overlook a special safeguard in time of strikes. During my presidency of the Atlantic Avenue Railroad Company in Brooklyn, we undertook to serve the Government in this regard, and prepared special cars. Part of these cars was devoted to mail matter and mail clerks, and part to regular passengers; so that while they were on the line they were earning money for the company from passengers the same as other cars and at the same time the United States Mail sign always insured a clear track. Our experience during the strike of last winter proved conclusively the value of a Government contract for carrying the mails. The 19 cars on our Fifth avenue line, which by the contract were permitted to carry the legend "United States Mail," were not molested, and we were able to keep that particular line open throughout the whole trouble. In view of all the circumstances, I believe a mail contract for a street railway is one of the most profitable things for a small one that they can undertake.

General News.

What is Going on in the Electrical World.

Shreveport, La.—The citizens have petitioned the city council for an electric light plant.

Lansingburgh, N. Y.—A company is being formed here for the purpose of furnishing electric light.

Emmetsburg, Ia.—The council is considering the proposition of Walsh Bros., of Burlington, to put in an electric plant.

Garrett, Ind.—This city desires to put in water works and electric light plant and has adopted plans and specifications therefor.

Pottsville, Pa.—Ground has been broken for the extension of the Schuylkill Electric Railway from Pottsville to Schuylkill Haven.

Hanson, Mass.—The business men of Hanson are procuring subscriptions for stock for an electric railroad from Hanson to Whitman.

Union Springs Ala—The city desires to grant an electric light franchise, and correspondence is solicited by D. A. Sissiuns, mayor.

Jacksonville, Fla.—D. F. Jack has been elected president of the Jacksonville Electric Railway Company vice Col. H. S. Haines, resigned.

Bristol Conn.—The next Legislature will be asked to grant a charter for an electric road to connect Bristol with Terryville and Thomaston.

Menasha, Wis.—The Citizens' Electric Company of Menasha has been granted a franchise for a plant to furnish this city with electric lights.

Hammond, La—The Hammond Electric Light and Power Company are making preparations to put in an electric light and power plant in this place.

Pittston, Pa.—Senator James L. Slocum is interested in a scheme to build an electric railway to connect with the Wilkes-Barre and Scranton lines.

Gladstone, Mich.—The proceeds of the sale of $12,000 bonds issued by this town will be applied partly to the construction of an electric lighting plant.

Burlington, Vt.—The Military Post Street Railway Extension Company has filed a petition for the location of a trolley railway to be constructed in this city.

Watsontown, Pa—The company operating the Milton electric light plant have proposed to extend their service to this town if sufficient patronage is guaranteed

Mauch Chunk, Pa.—The town council of East Mauch Chunk Borough have under consideration the proposed borough electric light plant and electric road extension.

Cairo, Ill.—An ordinance is before the council calling for the granting of a franchise to E. W. Falliday to construct an electric railway in one of the streets of this city.

Asbury Park, N. J.—The Asbury Park and Belmar Street Railway Company has filed articles of incorporation for a double track electric railway from Asbury Park to Belmar.

Hubbard, O—The vote at the recent special election on the question of issuing $6,000 bonds for the purpose of erecting an electric light plant was largely in favor of the issue.

Jersey City, N. J.—The street and water board have directed Clerk Bouton to advertise for proposals for the street lighting of Jersey City for the fiscal year ending December 1, 1896.

Batavia N. Y.—The board of aldermen have decided to appropriate $1,000 for the purchase of an incandescent electric plant to be used for lighting the city buildings and hose houses.

Rome, N. Y.—G. T. Breckenridge & Company of Albany were the lowest bidders for the electrical work on the Rome State Custodial Asylum at Rome, N. Y. Their figure was $3,495.

Niagara Falls, N. Y.—There is a movement in progress to connect Niagara Falls to Toronto, Can., by an electric road. The Hamilton Radial Railroad Company has been formed with that end in view.

Mt. Clemens, Mich.—Mayor Donaldson has received a communication from the officials of the Rapid Railway Company in which they reject the franchise offered them by the common council of this city.

Tacoma, Wash.—The city electric plant is to be improved at a cost of $10,000. The plant is now supplying 580 arc and over 3,000 incandescent lights. The capacity of the incandescent plant is 4,250 lights.

Randallstown, Md.—At a meeting held here a few days ago in the interest of the proposed Grown Oak and Harrisonville Electric Railroad it was announced that $10,000 had already been subscribed toward the project.

Bay City, Mich—The council has adopted the recommendation of the streets and lighting committee granting the Bay City Electric Light Commission authority to do commercial lighting in West Bay City under certain conditions.

St. Louis—A survey has been made and measures adopted for the extension of the Houseman electric line from Brentwood out the Manchester road to the village of Des Peres, and from there northward up the valley to Creve Coeur Lake.

Franklin, N. H—The survey for the electric street railway has been completed and the estimate of cost made. A stock subscription book is in the hands of E. H. Sturtevant, the company's treasurer, andthe citizens are invited to subscribe.

Port Huron, Mich—The Mt. Clemens and Port Huron Electric Railway is now under construction. All the contracts for the construction of the thirty-two miles of roadway have been executed and call for the completion of the work by December 14.

Chester, Pa—The directors of the Aston (Delaware County) Trolley Company have voted to increase the capital stock from $30,000 to $150,000, and preparations are being made to build the line, which will tap the populous towns along Chester Creek.

Homestead, Pa.—Sealed proposals, accompanied by certified check or bond to the amount of $500, will be received by O. S. Swisher, chairman of fire and light committee, until September 28, for lighting the streets of this borough with 60 or more 2,000 candle power arc lamps, for a term of ten years.

Los Angeles, Cal.—The ordinance granting to W. S. Hook, manager, and his assigns the right to construct and operate an electric street railway along certain streets of the City of Los Angeles, as adopted by the city council and approved by the Mayor, has been published in the city papers.

Elizabeth, N. J.—The executive committee of the board of trade is negotiating with a syndicate that has in view the extension of the East Jersey street horse car line to Rahway and Summit, and the changing of the motive power to the trolley system. About $300,000 will be spent in the undertaking.

Hempstead, N. Y.—The Long Island Electric Company has made application to the town board for a franchise to erect poles and run wires on the streets, avenues and highways in the villages of Freeport, Merrick and Wantagh for the purpose of furnishing arc and incandescent lights to the inhabitants of said villages.

Millbury, Mass.—The directors of the Blackstone Valley Electric Railway went to Boston last week and laid before the Railroad Commissioners the facts and figures in regard to their proposed line, showing the necessity of the new road and the advisability of a speedy charter for its construction and operation.

Brooklyn, N. Y.—The Rogers avenue trolley road which will form a new line to Manhattan Beach, Coney Island, is approaching completion. Albert L. Johnson, one of the builders of the road, states that the company has given an order to the Brill Car Company of Philadelphia for 400 open cars for next summer's business.

New York.—At a recent meeting of the stockholders of the United States Electric Forging Company the following directors and officers were elected: Directors: Geo. D. Burton, A. B. Bright, A. C. Garcia, B. J. Fredericlis and David Pfeiffer. Officers:

---

* Paper read before the New York State Railway Association, Albany, September 17, 1895.

THE TELEPHONE WORLD.

Not Bluffed by the Bell Company.

The Washington *Star* states that within a short time the Commissioners will install in the District of Columbia a telephone service for the exclusive use of the municipal government. They have decided that the instruments furnished by the Manhattan Electrical Supply Company, N. Y., are the equal of the Bell, and they will purchase a number of them and set up a telephone line of their own. This was decided some time ago, but the protest of the Chesapeake and Potomac Telephone Company against the use of these instruments, which it claimed, was a direct infringement of the Bell patents, set them to thinking, and before finally closing with the Manhattan company they required an indemnity bond to insure the District against infringement suits. This has been furnished, and the attorney for the District has declared it in good form and properly executed. All that now remains is for the Commissioners to close the deal and set up the instruments. It is understood, however, that the local telephone company will not submit to this new system without a vigorous protest, and may bring suit for infringement.

Future Development of the Telephone.

Emile Berliner in a recent interview said: "The next step in the development of the telephone will enable a number of persons to talk over the same wire simultaneously, and by this means the cost of long-distance telephoning will be much reduced. Experts are working on this problem now.

"The Bell Company spends $100,000 a year for experiments. In the Boston laboratory thirty experts are constantly engaged in working on telephone problems. An invention that is even now approaching perfection is the theatrophone. This contrivance will make it possible for people to step into a public office, and listen to grand opera, comic opera, or the songs and funny dialogues of a variety show, choosing among such attractions as please their fancy. Of course, such a device may be turned to account as a household convenience, so that the well-to-do citizen will be able to listen to a play or opera without leaving his dwelling."

Progress in Wisconsin.

The independent telephone companies now operating in Wisconsin are reported to be making considerable progress. In La Crosse a local company has recently opened an exchange and now has about 150 subscribers, but expect before long to have 300. The Waukesha line, which was built by the National Telephone Construction Company, is said to be doing a good business and now has a number of telephones in use. Negotiations are being carried on in Kenosha, Sheboygan and Ashland for the construction of exchanges which are to be operated in opposition to those of the Wisconsin Telephone Company.

One Way of Getting Even.

A short time ago the City Council of Wichita, Kan., ordered the Missouri and Kansas Telephone Company to reduce its rates, as is being done in other cities where rival companies have been started. The Telephone Company refused, and the Council proceeded to get even by enacting a telephone license ordinance. Under this ordinance the telephone company was to be compelled to pay a license of $12 a year for every telephone operated in the city and a penalty was fixed for a violation of the ordinance. W. G. Chipchase, manager of the telephone company, has been arrested for violation of the ordinance.

A Telephone Newspaper.

Budapest is the only city in the world that can as yet boast of a telephone newspaper. The idea of diffusing unwritten news was originated by the Hungarian, Theodor Albert Puskas, and the *Telephone Hirmondo* (Herald) has now been working successfully for over two years. The 6,000 subscribers are served by one wire, measuring 168 miles in length, and running along the windows of the subscribers. Each subscriber forms a station, and a separate line is connected with each station by means of a special apparatus, so that the main line is not affected if there is a block at one of the stations.

The bulletins are carefully edited and arranged in an orderly programme. The staff is on duty from 7:30 in the morning until 9:30 in the evening, during which time twenty-eight editions are spoken into the transmitter. Ten men with strong voices and clear articulation act as speakers, and take their turn in shifts of two at a time. One of these speaks a series of items, but for no longer than eight or ten minutes, and every new item is introduced by the word "new."

Toward evening, when news is growing scarcer, the subscribers are entertained with vocal and instrumental concerts. Connection has been made with the opera house and music halls, so that operas, as well as concerts, given in different parts of the town, are transmitted to the subscribers, who are often lulled to sleep by the strains of some favorite melody. The same arrangement has been made with the principal churches for Sundays and saints' days, especially for the Easter festival. The Budapest concerts are sometimes listened to throughout the whole dual monarchy, and even beyond its borders.

The Mutual Standard Telephone Company, which has secured control of the stock of the Mutual Automatic Telephone Company of Philadelphia, has been organized by electing Gen. James S. Clarkson, of Iowa, as president, and Robert M. McWade as general manager. The full capital, $1,500,000, has been paid in, and a contract has been made with Thomas Hurley, a contractor at Fort Worth, Tex, binding him to have fifty miles of the system constructed by next January. The Standard Telephone and Telegraph Company, which it was supposed had succeeded to the franchise of the Mutual Automatic Company, is in fact nothing but the construction company which will build the proposed Philadelphia plant. City Solicitor Kinsey has decided that the Mutual Automatic Company has no right to transfer the franchise already obtained.

The Newark Telephone Company has asked for a franchise at Newark, N. J., offering to furnish exchange service for $4 per month. The company has already secured upwards of 4,000 three-year contracts. The officers of the company are Franklin Noble, president; John M. Gwinnell and Wallace Somers Risley, vice-presidents, and Geo. H. Atkinson, secretary and general manager.

The new telephone exchange at Ocala, Fla., will consist of one hundred instruments to be installed in that place and Marti City. The officers of the company are J. B. Carlisle, president; D. W. Davis, secretary, and A. H. Birdsey, J. V. Burke, U. R. Warterman, and W. V. Newsom, directors.

The Superior Telephone Company has secured a twenty-five-year franchise at Superior, Wis. The rates will be $24 and $36 per year. Connections will be made with Duluth and the Twin Cities. John Goodnow, of Minneapolis, will be general manager of the new company.

The directors of the Bell Telephone Company have declared the regular quarterly dividend of $3 per share, payable October 15 to stockholders of record September 30. The matter of sale by auction of the stock unsubscribed for by stockholders was referred to the executive committee.

M. R. Thomas, Markleysburg, Pa., is president of the Somerfield Telephone Company, which has been chartered to construct and operate a telephone line connecting Petersburg, Markleysburg, Confluence, Uniontown and other towns in Somerset and Fayette counties, Pa.

Negotiations are about completed for the building of a new telephone line from Trempealeau, Wis., to Centerville, five miles distant, which will connect with the Luce-Veitch line, the Northwestern Telephone Company and the long-distance 'phone to Chicago.

The telephone line connecting Tarkio and Rockport, Mo., has been completed and is now in operation. The line is owned by Jesse L. and John Davis, of Rockport, and W. F. Rankin and Frank Travis, of Tarkio.

Beginning October 1 the Missouri and Kansas Telephone Company will cut rates at Leavenworth, Kan., to $1 and $2 per month. This is to overcome the opposition of the new People's Telephone Company.

R. E. Lowry, W. C. Morgan and John Hoschar, of Seymour, Ia., are interested in the proposed telephone line to be built from Seymour by way of Promise City to Corydon, Ia.

The Carolina Mutual Telephone and Telegraph Company has been organized to establish a new telephone system in Charleston, S. C. E. M. Bailey is interested.

G. W. Williams, of Olivet, S. D., has been granted a franchise to construct 100 miles of telephone line in Hutchinson County, that State, connecting the various towns with Parkston, the county seat.

The Louisiana Telephone Company is making arrangements to extend its system through all the towns along the line of the Chicago and Alton Railroad to Mexico, Audrain County, Mo.

The Luce-Veitch Telephone Company has been granted a twenty-year exclusive franchise by the city council of Galesville, Wis.

The Northwestern Telephone and Electric Company of Milwaukee has received a franchise to build an exchange at Sheboygan, Wis.

A telephone line has been projected from Center, the county seat of Cherokee County, Ala., to Gadsden, about thirty miles

The city council of Vermillion, S. D., has granted a franchise to J. C. Tomlinson, W. A. Cottrell and the Clark Electric Telephone Company.

The failure of the Detroit Harrison Telephone Company to deposit $25,000 as a guarantee has been construed by the City Council of Detroit as a forfeiture of its franchise. Accordingly, the ordinance granting similar rights to the Brown Loud Speaking Telephone Company has been passed over Mayor Pingree's veto. It is announced by the representatives of both telephone companies that work on the plants will begin within 60 days.

T. J. Roberts & Son are erecting a telephone to connect their plantation at Centerville with Tallahassee, Fla.

The American Telephone and Telegraph Company has secured a franchise at Grand Rapids, Mich.

Marshall & Toby have decided to extend their telephone line from Reynolds to Rock Island, Ill.

The Logansport Mutual Telephone Company has secured a franchise at Logansport, Ind.

Knoxville and Chattanooga, Tenn., are now connected by long-distance telephone.

An effort is being made to organize a telephone exchange company at Bedford, Ia.

A telephone line is to be constructed between St. Elmo and Portersville, Ala.

The local Bell Company has cut rates to $16 per year at Cheboygan, Mich.

There is talk of organizing a local telephone company at Marlboro, N. Y.

A telephone line is proposed to connect Jasper and Kirbyville, Tex.

New Companies Incorporated.

The Huntington Phœnix Telephone Company, Huntington, Ind., has been incorporated with a capital of $15,000.

The Manchester Telephone Company, Manchester, N. H. Capital stock, $125,000. Incorporators' names not given.

The Beaumont Telephone Company, Beaumont, Tex. Capital stock, $10,000. Incorporators: E. L. Bacon, J. F. Keith and Minnie King.

The Menominee Telephone Company, Menominee, Wis. Capital stock, $12,000. Incorporators: James B. Hills, Sanford J. Heafield and Elmer J. Newson.

The Montgomery County Telephone Co., Hillsboro, Ill. —to construct a telephone line to Coffeen, Ill. President. Jacob J. Frey; secretary and treasurer, Charles A. Ramsey.

The North Argyle Union Telephone Company—to connect Argyle and North Argyle, Washington County, N. Y. Capital, $250. Directors: William D. Stevenson, Alexander S. Cuthbert, Rodney Van Wormer, Robert B. Scott, and others, of Argyle.

The Humboldt Telephone Company, Ferndale, Cal. Capital stock, $5,000. Directors: H. H. Moller, George M. Brice of Ferndale, Charles A. Eastman of Fortuna, G. C. Barber, Grisley Bluff, Frank W. Luther, Alton.

The La Grande Telephone Company, La Grande, Ore.—to build a telephone line from La Grande to Union and Elgin, Ore. Capital stock, $3,000. Incorporators: J. W. Scribner, F. D. McCully and W. W. Hinman.

The Baraboo Telephone Company, Baraboo, Wis., recently incorporated with a capital stock of $3,600, has elected the following officers: President, Dr. Charles Gorst; vice-president, E. P. McFutridge; secretary, A. F. Fisher; treasurer, Henry Marniott.

The Harford Telephone Company, Harford County, Md. —to erect and operate telephone and telegraph lines throughout the State of Maryland. Capital stock, $5,000. Incorporators: Wm. B. Baker, T. Littleton Hanway, Wm. H. Reasin, Robert C. Richardson and Walter W. Finney.

The Citizens' Telephone Company, Grand Rapids, Mich. Capital stock, $10,000. Directors: James M. Barnett, Ernest B. Fisher, Cyrus E. Perkins, Phillip Graham, Samuel B Jenks, Charles R. Sligh, Gaius W. Perkins, Edward Fitzgerald, Charles F. Rood, William J. Stuart, Ernest A. Stowe and Amos S. Musselman.

The Matfield Green and Bazar Telephone Company. Matfield Green, Kan.—to build a line of telephone between Matfield Green, Chase County, and Bazar. The capital stock of the company is placed at $1,000, and the directors named in the charter are John Carnes, B. F. Talkington, P. J. Heiz, Levi Jones, R. F. Sargent, W. F. Dunlap and O. H. Lewis, all of Matfield Green.

The Delaware River Telephone and Telegraph Company of Liberty, Sullivan County, N. Y.—to construct telephone lines through Sullivan, Orange, Ulster and Delaware Counties in New York, Wayne and Pike Counties, Penn., and Sussex County, N. J., connecting Deposit, Hancock, Port Jervis, Honesdale, Milford, Middletown, Bloomingburg. Wurtsborough, Ellenville, Grahamsville, Livingston Manor. New Beach, Roscoe Trout Brook, and Walton. Capital. $25,000. Directors: Charles Homer and E. H. Pinney of Jeffersonville, George Christians, Wallace M. Kilburn, and others of Liberty, and John H. Scofield of New York City.

ELECTRICITY.

EDITORIAL NOTES.

The Case of John L. Martin. Mr. John L. Martin, who held an important position in the Chicago offices of the Thomson-Houston and General Electric companies for nearly ten years, was arrested in New York last week. He had called at the stationery store of Corlies, Macy & Co., No. 97 William street, and said he was J. B. Moore, cashier of the Merchants and Manufacturers' Bank of Chicago. He explained that he had opened an account with the Central National Bank of this city. He desired some checks and gave an order for 4,000 to be printed in black ink. A thousand of them were to be printed for the Central National Bank and the remainder for the Merchants and Manufacturers' Bank. It was learned that Martin had no account at the Central National Bank, and that there was no such bank in Chicago as he claimed to represent. He was therefore taken into custody, although there was no direct charge against him here. Martin had been living at the Astor House and had been able to pay his way out of winnings at the race tracks and small amounts raised from negotiating bogus checks.

Martin's habits had become well known, and his arrest will cause little surprise. He had been arrested in July at Detroit, but in that case also there was no specific charge against him.

Ordinarily the downfall of any one man creates small interest and should be passed over in charity. But the case of John L. Martin is full of lessons which need to be taught over and over again, and to which the press may well devote some space.

Martin was well known and well liked. He had friends without number, every one of whom would have given him a lift when he needed it. He has good business abilities and could have earned a decent living for himself and family.

Most people will say, Why should he turn swindler? To which it is proper to answer, Why should he not turn swindler when he needed money? For years he had been accustomed, in the line of his official duties, to assist in covering up the swindling operations of his superior officers. He had been one of the earliest pupils in Mr. Charles A. Coffin's school of crime at Boston, and was taken to Chicago and placed in charge of the Central Station department by Silas A. Barton. He had seen territory farmed out systematically so that Mr. B. E. Sunny's favorites could obtain illegitimate commissions from their employers. He had seen the spoils divided. He had been an eye-witness of the many rascalities in the Chicago office. He had seen the thieves advanced in position while honest men were discharged. He had known that the stealings were not all retained at Chicago, but that a portion of them went to Boston to his superiors. He had been fully aware of the carefully laid plans of Coffin and Sunny to rob the public by the sale of bogus stocks and bonds. He had seen the employees of the Thomson-Houston Company, from Coffin and Sunny down, enter into various outside trades and deals whereby all the profits were to be divided among the individuals at the expense of the company they had agreed to serve. He had seen original memorandums over the signature of Mr. C. A. Coffin, informing district agents what price they could have apparatus for, and that they could "retain" anything over this amount which they could get from the public. He had seen Sunny, directed by Coffin, raise over $2,000,000 on worthless paper at Chicago banks. He had known of a half-dozen detailed reports of the stealings in the Chicago office, sent to Mr. Coffin, thrown into the waste basket without attention and the men making them either discharged or told to mind their own business. He had seen his employers deliberately conspire to rob the public, guided within the law by their eminent counsel.

Why should he, a weak-minded man, not follow in their footsteps as nearly as he could, and try and make something from nothing? Why should he hesitate to rob his friends or the general public? That this was the proper thing to do had been hammered into him for ten years.

Mr. Martin's case should make Mr. C. A. Coffin shudder. And no matter how callous Mr. Coffin may seem to be, we doubt not that many times in the silent hours of the night, when honest men sleep, his rest is disturbed by visions of a procession of young men whom he has debauched, a mournful company, saying, "You made us what we are. We were honest men till you taught us to commit crime."

If Mr. Coffin's dreams are not thus troubled, why does he leave his hotel at 4 or 5 o'clock morning after morning and walk the streets, unable to sleep longer?

Mr. Martin's conduct should create no surprise. We make no apology for him. He is guilty of serious offences against the law, and punishment will overtake him. Yet he no doubt fails to see where he is any worse than his old employers, and laments the lack of money which prevents his hiring expert counsel like F. P. Fish to advise him what forms of swindling are legal and what are not. He can see little difference morally between his crimes and those of his superiors, and works within his capabilities, forging a $50 or $100 check with as little compunction as Coffin showed in planning, through his attorney, to spend $65,000 in buying votes at Albany for the charter of the General Electric Company.

On Thursday Martin was held upon a charge of petty larceny until the New York authorities could learn whether or not he was wanted in other cities, Nothing was found against him, and he was subsequently discharged.

His old acquaintances here, whom he had swindled out of sums up to $100, would not appear against him. They did not share the spirit of Mr. Sunny, who induced the *Western Electrician* to expose him and who said that "Martin ought to be in the penitentiary, and I would be glad to put him there."

If all the employees of the Chicago office of the General Electric Company who ought to be in jail were actually sent there, Martin would have plenty of company.

No doubt Martin should go to the penitentiary. He is an enemy of society, a rebel against established law. Yet he is a much less dangerous enemy of society than C. A. Coffin, his instructor and his prototype.

* * *

"Electricity" and the British Association. It has happened so frequently that ELECTRICITY has distanced its contemporaries that it has become an old story. There are, however, some stories that bear repetition, and it is with pleasure that we refer to our presentation in advance of all of our contemporaries of the reports of the recent British Association meeting.

By special arrangements we have thus far been nearly always at least a week in advance of any other American publication in presenting important English news, and in the case of the British Association the electrical portion has been reported with nearly the same promptitude and completeness that is our wont in the case of the meetings of American Electrical Societies.

While several of our enterprising (?) confreres are quarreling over their relative senilities, ELECTRICITY with its young blood steps in and "gets there."

Would it not be better for our friends the enemy to stop their quarreling and attempt some genuine newspaper enterprise?

* * *

Faint-Hearted Telephone Manufacturers. It is a law of business, as wel as of love, that faint-heartedness does not win. That the adage most fittingly applies to the more tender relation, few of those qualified by experience to judge will deny. But in its application to the sterner and more real, yet none the less vexatious relation, there are many to whom experience has taught nothing.

Of the latter class there are many in the electrical trade—some even in the field of electrical journalism—but the most conspicuous, just now, are certain telephone manufacturers. Until recently these rejoiced in the distinction of "independent," which term, by common consent, has been the designation applied to all telephone manufacturers outside of the Bell Company's fold. So long as the Bell Company remained outwardly inactive these supposedly and so-called independent competitors of the great New England corporation made bold to say that they were in the business to stay and that they were anxiously waiting for an opportunity to meet the Bell Company in the legal arena.

In the agitation and discussion leading up to the organization of the Telephone Protective Associations these zealous members of the craft were heard early and often. They were as prolific in suggestion as they were profuse in promises. But when the real business of organization had reached the point of calling upon members for dues and contributions to the defence fund, they were found to be wanting. No sooner had the Milk Street Giant begun to arouse himself than these Liliputians of the trade began to vanish into thin air. With each succeeding step taken by the Bell Company in its attempt to retain and prolong the monopoly that is slowly but surely slipping from its grasp, the number of the weak-kneed telephone manufacturers has increased.

The strength of the independent telephone movement is not impaired by these defections from the ranks. On the contrary it is increased and made more effective. With the timid and frightened out of the way, those who are in the trade, not to sell out or to sneak out, but to stay, will know what to do and upon whom to depend.

There are in New York, in the East, in the West, and in other sections of the country a number of earnest, capable and honest men who have gone into the telephone business for legitimate purposes. They understand the situation, appreciate all the difficulties, but they are not scared, neither are they disheartened or dismayed. On them will devolve all the labor, expense and effort necessary to reach a solution of the perplexities which have, but temporarily, retarded the growth of the independent telephone business.

They are ready to fight, and they mean to do it. They will win, because not faint-hearted.

European vs. American Lamps. It is so often thrown up to Americans that they give less attention to quality than to quantity that it is gratifying to know that such is not always the case.

Some weeks ago we published a somewhat extended article by Prof. Thomas of the Ohio State University upon some incandescent lamp tests, and this week we publish an elaborate article by Mr. Paisley on tests of foreign lamps, which show them to be so far inferior to what are manufactured in this country as to excite some suspicion that they are not fair samples of foreign manufacture. Mr. Paisley assures us, however, that the lamps under test were fair samples of those purchasable in the open market, and his method of selecting them would seem to preclude any injustice having been done.

In this country the lamp competition has been so strong that our manufacturers have felt that their only hope of success lay not only in a cheap lamp, but in a good one. Therefore, while some manufacturers have pursued the suicidal policy of selling too cheaply, they have not at the same time sacrificed quality as our foreign brethren seem to have done.

"The Electrical Engineer" Imposed Upon. It is safe to say that every one of the electrical journals uses every endeavor to avoid imposition, but notwithstanding all these endeavors, the best of us sometimes fail, and when such failures occur they excite sympathy rather than ridicule among their contemporaries. A noteworthy instance of failure of this kind occurred last week with the *Electrical Engineer*, which published a well written albeit a ridiculous article from the pen of Geo. D. Burton on "Smelting Refractory Ores in the Electric Furnace."

Not one of the staff of the *Electrical Engineer* being a metallurgist, chemist or mining engineer, it is scarcely to be supposed that it should be able to discriminate between the probable and improbable in metallurgical practice, so that we pity rather than censure it for having given space to Mr. Burton's article.

For Mr. Burton, however, who has imposed upon the credulity of our contemporary, we have no words too strong to express our contempt. The whole article from beginning to end is a tissue of absurdities such as seem to us ought to be apparent to the most superficial lay reader. Our first impulse was to reprint the article in full and specify the leading falsities, but on second consideration we deem our space too valuable for this purpose.

What is Insanity?

(A Sane Man's Letter From a Madhouse, in "A Terrible Temptation.")

"Taking the people here as a guide, the insane in general appear to be people with very little brains and enormous egotism. . . . There are, I think, all forms of that morbid egotism which is at the bottom of insanity. So is their antipathy for each other. They keep apart; because a madman is all self, and his talk is all self; thus egotisms clash and an antipathy arises; yet it is not, I think, pure antipathy, though so regarded, but a mere form of their boundless egotism."

Under the Searchlight.

Views and Opinions on Timely Topics.

THE ST. PAUL AND WHITE BEAR RAILROAD AND WILDWOOD PARK.

In our issue of August 7 we devoted considerable space to the affairs of the above railroad and park, the latter a resort established by Mr. H. M. Byllesby to tempt the populace of St. Paul to ride over the eleven miles of road owned by the railroad company, which was capitalized for $500,000.

A representative of ELECTRICITY on a recent visit to St. Paul had the pleasure of making a trip over this great railroad system, and of enjoying the beauties of Wildwood Park for a few hours.

One car was then being run every half hour from the terminus of the East Seventh street line in St. Paul, which latter has extended its tracks to make connection with the White Bear road.

The White Bear line's terminus is at the extreme eastern limit of the built-up portion of the city. Between this point and North St. Paul, a distance of some three miles, about twelve residences were counted, mostly farm houses. North St. Paul looks like what it is—a boom town gone to pieces. Mr. Ralph Beach's old wagon factory, with broken windows and decaying roof, is one of the monuments still left to remind the visitor of what might have been but was not. Here the rolling stock of the steam dummy line which Mr. Byllesby bought for $75,000 is seen standing on side tracks, rusting and rotting in decay. There are two small engines and three cars. They will, no doubt, lie where they are, as they could not now be moved without falling in pieces.

Between this point and the lake there are less than a dozen houses, the road running through the fields the entire distance of eight miles. The roadbed is in bad condition, the rails are light and badly used up, and anything like speed is out of the question.

At the park there were perhaps 50 to 75 people. Mr. Byllesby's resort has not proved a success. There was a ball game in progress, the players doing their best in a field where the grass was about 6 inches high, not having been cut this season. There was a dancing hall, about 40 feet square, where a blonde young lady of athletic training played the piano, and a one-legged fiddler in a sweater did the rest of the duty of an orchestra. He had a one-quart tin pail beside his chair for a spittoon, and when this was unavailable he visited at intervals a reserve pail of the same size which stood behind the piano. Four large signs, warning guests not to spit on the floor, adorned the walls of this pavilion. The dancers were three times, in number, the size of the orchestra—six people. Adjoining the dancing pavilion was a little restaurant, where sandwiches, beer, etc., were sold, and there was one stand displaying stick candy and peanuts.

A hundred feet away is a diminutive roller skating rink, around the walls of which hangs a roller coasting track which would give a Coney Island fakir a stroke of heart disease, and will certainly cause Chimmie Fadden to say "Wat t'ell," if he ever sees it. No iron tracks were laid, the car rolling down upon basswood boards 6 inches wide and 1 inch thick. The ties, of similar material, are about 18 inches apart, and the "track" is worn and rotted so that a collapse may be looked for on any trip with reasonable expectation that it will take place. At the end there is a little tunnel, 20 feet long, over which is hung the sign, "No kissing in the tunnel." There is no danger of a violation of this rule. Even the most amorous couple would be thanking their stars at that point that they were still alive, and would not be in the right humor to do any kissing.

All the buildings are of the cheapest frame construction. A few rowboats and two or three sailboats are offered for hire, and there are a few bath-houses. In the water there is one toboggan slide about 15 feet high. The bathing sign reads as follows: "Bathing 15 cents with suits; 25 cents without suits." This seemed to put too small a penalty on *nudity*.

Mr. Byllesby's two bears have disappeared, as *they* were not drawing cards. A few tables were provided at one end of the park for the impecunious with basket lunches. No lawns were laid out or hard paths made. The soil is composed of a species of loamy sand, about 6 inches deep when dry and bottomless when wet. Through this the few visitors wallow.

We believe we have now chronicled all the amusement features of Wildwood Park, which Mr. Byllesby thought were sufficient to draw a throng of visitors from St. Paul in spite of the many really elegant resorts within their reach. The bondholders may form from this a good idea of the value of their investment.

Returning to St. Paul by a different route, crossing the lake to White Bear Beach, one finds a charming resort there, around which a large number of pretty cottages have been built, with nice grounds and appointments which would be creditable to any locality.

* * *

The subject of "Induced Travel" has come to be quite a study for a great many of our street railway men. Among the inducements for the public to visit Lake Como, near St. Paul, have been this summer the performances of Prof. Dugay, which are thus described in placards hung in the street cars of that city:

> "Professor A. J. Dugay will walk across Lake Como on a high wire. The Professor will also take a wheelbarrow and a stove out on the wire, where he will cook and eat his dinner. He will also stand on his head."

This ought to fill the cars.

* * *

At the opening meeting of the New York Electrical Society at Columbia College, on Friday evening last, Mr. T. C. Martin delivered a popular lecture on "Niagara on Tap."

It is to be regretted that Mr. Martin did not confine himself entirely to facts, instead of giving figures as to what it will cost the Niagara Company to send power to Buffalo. The lines have not yet been built, and there is no prospect that Niagara power will be sent to Buffalo in the near future. Moreover, every official estimate on the cost of delivering this power twenty miles away has been proved to be wildly inaccurate. This was notably the case with the Houston-Kennelly estimate, which Mr. Martin's paper still fathers, even though Mr. Kennelly has since confessed his error. A popular lecturer, even though a humorist like Mr. Martin, should not assist in promulgating misinformation.

* * *

Why So Many Failures?

The failure of such concerns as that of which Mr. Henry B. Cutter of Philadelphia was at the head, and many others that have occurred in the past three years, are signs of the times which others in this trade cannot afford to ignore. They prove as conclusively as we could desire the superior foresight of Electricity in 1892, and the correctness of our views on the general situation. Mr. Cutter is a man respected by all who know him; his concern was conservatively managed; they made good goods, and tried to do a square business. They have failed because the kind of business methods prevailing in this trade are such as few honestly managed companies can survive in competition; because so many companies are being managed without regard to the interests of stockholders; because goods are sold too cheap. It is with regret, but with perfect composure, that we remember that the Cutter Company never saw fit to give any encouragement to Electricity, the only paper in the field working conscientiously to eradicate the evil features which have forced so many decent concerns to the wall. We shall still win our fight. It is nearly won now. But we could fight with more effectiveness if every honest company in the United States would extend the right hand of fellowship. We need their support, but not half as much as they need Electricity, and dozens of concerns, apparently prosperous now, will yet have particular reason, as the Cutter Company has, to appreciate the logic of our arguments.

* * *

It is in evidence, over Mr. C. A. Coffin's own signature, that he at least never expected the G. E. Company to make any money out of the sale of apparatus. In the last week of May, 1892, just before the formal realization of the consolidation arrangement, he wrote to Mr. H. M. Byllesby a personal letter in which he says among many other interesting things: "Please advise me as soon as possible how many stocks and bonds you will be able to turn in during the coming year. Whenever we lend financial assistance to local companies we should get a large bonus in stocks and bonds in addition to the stocks and bonds taken for territorial licenses. We expect to take in enough stocks and bonds as bonuses to pay all our dividends, leaving whatever profits there may be from manufacture to apply to surplus account."

Was this also Mr. J. P. Morgan's expectation when he was advising his friends to buy G. E. shares above par? Did this kind of a business seem to Mr. Morgan to possess the elements of soundness?

* * *

Prof. Forbes is now in Africa, but we do not think he is on the same errand that took Prof. Garner there. Forbes has no need to study the monkey language.

* * *

About the worst fault that a newspaper can have is the use of slovenly English, and there is no greater offender on our exchange list than the *Electrical Engineer*. It is not enough that it drivel and drone in its efforts to fill space without saying anything, it does worse and ignores its grammar and its dictionary. Last week in an editorial on standardizing lamp sockets it uses such jumbles as "miscellaneity" and standardization"—words which are not found in Webster and which mean nothing.

* * *

No writer ever made more kinds of a fool of himself in one article than George Forbes.

* * *

We suppose at least 5,000,000 people have had their ears glued to their telephones for a week waiting to hear the results of Mr. James E. Keelyn's efforts to have the Bell Telephone Company abolished on account of its violation of anti-trust laws. They will not have much longer to wait for startling news. They are likely to hear any moment that Molony has begun quo warranto proceedings and that Altgeld has declared that U. S. patents do not go in Illinois.

* * *

A special committee of the Lynn, Mass., Board of Trade has reported, upon the authority of Mr. C. A. Coffin, that unless that town makes special inducements to retain them the General Electric shops may be moved to Schenectady.

* * *

The Metropolitan Elevated Railway Company in Chicago has issued orders that hereafter any employee burning his hands on the third rail will be discharged. This is not a joke. So many employees have disabled themselves in this way, and been carried on the payroll while their hands were healing, that it has become a burden. Hereafter we suppose the employees will risk dropping to the street in case of a misstep rather than grab the third rail.

* * *

A story of last week is that Mr. Coffin, expecting to be forced out of the General Electric Company at an early day, called one of his old-time favorites to his office and said: "We want you to promise to stick to *me* no matter what happens, will you do it?" The story says that the young man recalled former ill-treatment to Mr. Coffin's mind, that when he had been in the very shadow of the penitentiary Mr. Coffin deserted him, and declined to make any such promise. This story cannot be *all* truth. If Mr. Coffin had made any such request, the answer would have been: "Why, certainly, Mr. Coffin; you have been the best friend I ever had, have done more for me than anyone else, and if I can serve you in any way you can count on my doing so."

FORBES'S APOTHEOSIS OF FORBES.

I am the only Engineer in the World;
I do things impossible to other men.
The blawsted American Bounder
May blow his bazoo,
But I'm blowed
If he can beat
Me.
I invented Electricity,
I discovered the Universe,
And I expect to make a New Earth,
If My Millionaires
Put up the stuff.
I can draw plans as easy
As I can draw my breath,
Or my $400 a month salary.
I can design dynamos with my eyes shut,
But nobody can build them.
I went to the States
Because I was the Only Man
Who could Tap Niagara,
Or build any other
Great Work.
My plans did not suit any one
But Me,
And I had some trouble
To keep
My president
My vice-president. and
My directors
In hand,
But I used tact and judgment,
Likewise forbearance,
And soon they thought there was nobody
Like Me.
Kelvin, Tesla, Turrettini, Rowland, Mascart and Sellers
Thought they knew something about
Low frequencies, ohms and volts, but
They never touched Me,
Not Me.
I am mostly a modest man,
But I was born with a Great Brain.
I have a Big Head,
And I know it.
I never brag about what I know,
But when I open my mouth
And begin to spout language
About what I have done,
Niagara isn't in it
With Me.
When I curb my reticence
And address the vulgar crowd
My Countrymen blush for shame,
The average American profanely laughs;
But what's that
To Me.
I have dined with Barlow and Conkling, and
I want the world to know it.
Conkling I adored, because
His bump
Of vanity and Mine
Were twins.
I can tolerate the
Potters, the Bruzes, the Lorillards, the
Delafields, the Fishes, the Kents, the Rushmores, the
Prestons, the Van Courtlandts, the Van Nests, and
Allen Lathrop,
Who tolerated me for the sake of my
Father and my brother.
But the rest of the
Sixty Million Americans are
All beneath
Me.
And if there is one species I
Can't endure, it is
American bagmen or drummers,
Because
They refused to recognize
My Greatness.
History may fail to give me any place,
But I make my own place.
When I want to be heard I speak—
Even my clothes speak.
I need no monuments,
Not I.
I am the megacephalous Man,
I am the Master Mind,
I am the only Creative Genius,
I am the only man with New Ideas,
I am the Harnesser of Niagara,
I am Superlative Muchness,
I live in London,
I have preserved my Englishness,
And my name is
Forbes—
George Forbes, C. E.

Brooklyn Edison Co. Rebels.

REFUSES TO BUY MONOCYCLIC GENERATORS.

Stanley Company Secures the Contract.

At the last meeting of the N. E. L. A., at Cleveland in February of this year, Dr. Louis Bell read an interesting paper on the Monocyclic System of Transmission. The paper was a strong one, and was intended to leave no doubt in the minds of central station men as to the superiority of this system over the Westinghouse or Stanley two-phase systems. Again, at the annual meeting of the Edison licensees in August, Mr. Emmet, for the General Electric Company, endeavored to show conclusively that the monocyclic was the only system for the licensees to adopt in conjunction with the Edison three-wire system.

It is apparent now that both these gentlemen labored in vain, as did Prof. Steinmetz when he spent so many months in his work (either original or imitative) upon the monocyclic system.

After a thorough examination of the three systems (General Electric, Westinghouse and Stanley), the two leading Edison licensee stations, New York and Brooklyn, have decided that the monocyclic system does not meet their requirements, and have purchased other apparatus.

Last week the Brooklyn Edison Company contracted with the Stanley Electric and Manufacturing Company for two 350 K. W. machines with accessories. The General Electric Company made every effort to prevent the Brooklyn Company from making the purchase. Every possible argument, both commercial and technical, was used. On the commercial side there was little to say, as the purchase was made through the Citizens' Company, lately absorbed by the Brooklyn Edison Company, hence there was no direct violation of the licensee contract. On Thursday a delegation of General Electric people, composed of Messrs. Steinmetz, Greene, Rice, Emmet and Hughes, spent several hours with President Ethan Allen Doty, Secretary Royal C. Peabody and Manager W. S. Barstow, of the Brooklyn Company. Every point was gone over, and even Mr. Steinmetz was compelled to admit that for the purposes of an Edison three-wire station the monocyclic system is inferior.

The New York Edison Company, it is understood, have also bought Stanley apparatus for the Manhattan Station.

ELECTRICITY's often expressed opinion, that the entire body of Edison licensees must soon break away completely from the General Electric Company is materially strengthened by these events. The General Electric Company has fallen behind in the race, and can no longer give the licensees what they need.

It is improbable that any Edison licensee company in the country will again be foolish enough to pay over any percentage of increases in capital stock as a bonus to the parent company under the old licensee contract. At the time of the last increase of the Brooklyn Company that company compromised by paying over about 7 per cent. instead of the 30 per cent. called for in the contract.

The question as to whether the rank and file of the Edison licensees will adopt the monocyclic system as an adjunct is pretty thoroughly settled in the negative. It has been carefully investigated by the managers of the leading stations in the East and found wanting. Other stations will accept the conclusions of these managers as correct.

Ohio Electric Light Association.

The annual meeting of the Ohio Electric Light Association will be held at Piqua, Ohio, beginning at 2 P. M. Tuesday, October 8, 1895. Arrangements have been made with the Hotel Plaza for the accommodation, at reasonable rates, of all who may attend.

SOCIETY NEWS.

The American Institute of Electrical Engineers.

The first of the fall meetings of the Institute in New York was held in the banquet hall of the Hoffman House on Wednesday evening, September 25, the paper of the evening being one by Mr. Charles S. Bradley on "Phasing Transformers." The paper itself, which will be found elsewhere in this issue, was one of absorbing interest. Mr. Bradley is original in everything—in his methods of thought as well as in his methods of expression and action—and it was therefore rather to be expected that the occasion of the reading of his paper would be attended by something out of the ordinary. The announcement that the paper would be read at the Hoffman House instead of at the usual place of meeting, was in itself sufficiently out of the ordinary to satisfy expectations, but Mr. Bradley had another treat in store for his guests besides his excellent paper. After the discussion, which by the way was all too brief, President Duncan requested, on behalf of Mr. Bradley, that the members remain for a while. At a given signal a number of spike-tailed waiters appeared and the quondam banquet hall resumed its appropriate function, and the members of the Institute found themselves the guests of Mr. Bradley at an elegant lunch, such as few besides Mr. Bradley could have planned and few besides the Hoffman House could have carried out.

The remainder of the evening was spent in social intercourse which was most enjoyable, and the event is one that will be long remembered by those who were so fortunate as to be present.

At the regular monthly meeting of Council, held at the rooms of the Institute September 25, the following associate members were elected: Sydney B. Austin, Sidney, N. Y.; Geo. H. Blaxter, Pittsburg, Pa.; Elmer E. Boyer, Lynn, Mass.; Byron T. Burt, Charleston, S. C.; Henry S. Carhart, Ann Arbor, Mich.; John B. Cornell, Hamilton, O.; Maurice Coster, Chicago, Ill.; David Francis Crawford, Fort Wayne, Ind.; Philip Dawson, London, Eng.; Lewis Degen, Rio de Janeiro, Brazil; Will Knox Dunlap, Pittsburg, Pa.; Thomas C. Fremyear, Gloversville, N. Y.; Carl Harold Hakonson, Schenectady, N. Y.; Russell B. Harrison, Terre Haute, Ind.; Robert R. Harvey, Wilkes-Barre, Pa.; Chas. E. Hewitt, Hanover, N. H.; Chas. R. Huntley, Buffalo, N. Y.; D. W. Irvine, Chambersburg, Pa.; W. Wallace Ker, Jersey City, N. J.; Paul M. Lincoln, Niagara Falls, N. Y.; Robert Bruce Mann, Milwaukee, Wis.; Josiah L. Merrill, Schenectady, N. Y.; Chas. H. Merz, Newcastle-on-Tyne, Eng.; James Mitchell, Rio de Janeiro, Brazil; Edgar L. Morley, New York City; Evan Parry, East Dulwich, London, S. E.; Andrew Pinkerton, Appolo, Pa.; Percy Howard Powell, Hempstead, N. Y.; Dwight Parker Robinson, Chicago, Ill.; David B. Rushmore, Plainfield, N. J.; John F. Skirrow, Brooklyn, N. Y.; Henry G. Stott, Buffalo, N. Y.; Gustav Adolph Wiese, Alameda, Cal.; Chester P. Wilson, Philadelphia, Pa. Total, 34.

PROPOSED SETTLEMENT.

The proposal of the Cutter Electrical and Manufacturing Company of Philadelphia for settlement with creditors shows nominal assets of about $42,000, of which $14,000 is in accounts receivable; liabilities are about $28,000. There are attachments aggregating about $8,000. It is proposed by the company to give notes to these secured creditors, with outside endorsement, and thus release the property; to pay all bills of less than $20 in cash within 60 days, and to give unsecured notes without interest to other creditors, to run 6, 12, 18, 24, 30 and 36 months, equally divided.

If this settlement is satisfactory the company will proceed at once.

Boss-Rittle.

Mr. John C. Boss, president of The Lakon Company, Elkhart, Ind., was married on the 25th inst. to Miss Anna Rittle of that city.

European Incandescent Lamps.

BY D. PAISLEY.

(Reproduction Reserved.)

It is generally known that the Edison & Swan Company's master patents of glow lamps expired in England in November, 1893, and it may be interesting to the readers of ELECTRICITY to learn the results of the expiry of the monopoly held so tenaciously in that country by the company just mentioned.

Up to a month or two before the lapse of the patent, the price of an ordinary "Central Station" lamp, of say 8 to 25 candle power, 50 to 110 volts, was 90 cents, when it was suddenly reduced to 40 cents, owing doubtless to the fact that many European Continental makers were offering their lamps for sale in England, for forward delivery, the day after the expiry of the patent, at a fourth of the then current Edison & Swan Company's price. This price of 40 cents is still in force for the lamps mentioned above, that is nominally, but it is an open secret that for even small quantities the price to favored parties, or parties who can make their own terms, is now as low as 28 to 30 cents, while the fact that the Ediswan factory is now working overtime, in view of the already large stocks still held by the factory at the numerous depots, points to a still greater reduction on the present price. The reason for this latter action is not far to seek, for the total requirements of the United Kingdom for central station lamps alone this winter will be quite three millions, while considerably over one million will be necessary for independent installations, not to mention the very large number of lamps of special voltages and shapes, more particularly for decorative purposes. Of this large number of lamps, the Edison-Swan Company, under ordinary circumstances, without reduction in prices, would not secure more than 750,000 of the class known as central station lamps, leaving the remainder to be covered by the European Continental manufacturers. The company therefore seems determined to reduce its price to the level of the best quality competitors in the hope of being able to retrieve its position as monopolizers of the British trade. If it fail in its endeavor, the question becomes a serious one, as it is impossible to exist with a capital of about $2,500,000 on a sale of say 1,200,000 per annum with a net profit of 3 to 4 cents per lamp.

One result of the expiry of the monopoly in Great Britain was the flooding of the market with lamps of all sorts and conditions, and consequently a rapid fall in the prices. The two worst sinners in this latter respect, one in Hamburg and the other in Berlin, have gone the way of all price-cutters, and the London market knows them no more. Others are likely to follow, but at the moment the trade in the hands of its present possessors seems stable and settled down to an ordinary business. It is not at all surprising that these Continental makers rushed headlong into the English trade; the only trademark known was that of the old monopoly, and the only recommendation needed to sell lamps was a low price, the question of life and efficiency being relegated to a second place.

Now that the excitement has quite calmed down, it will be interesting to know the quality of the lamps now on the English market, and to this end the writer purchased the lamps enumerated below at the prices noted, they having been sold to him "over the counter," in no way specially chosen, the special purpose for which they were intended not having been mentioned.

The figures show the results of the time trials of the lamps run at the voltage marked on the lamps, which was in all cases 100 volts. The trial was conducted perfectly unbiased, the best instruments were employed for the readings, and these were compared several times during the trial with other standard instruments. The readings were taken every week, but the space at disposal of this article would be insufficient to give the weekly results, and as the average useful life is less than 600 hours, the two tables comprise the results at the beginning of the run, at 350 hours, and at 600 hours, notes being given of the life of such lamps as burned out before the end of the 600 hours.

The tables given are sufficiently explanatory; each lamp of each manufacturer is noted as having consumed so much of an ampere, run at a voltage of 100, and the product of the voltage by the amperage divided by the candle-power at the various stages of the trial gives of course the watts expended per candle-power produced:

RESULTS OF TIME TRIALS OF GLOW LAMPS OF 17 EUROPEAN MAKERS, RUN AT MARKED VOLTAGE.

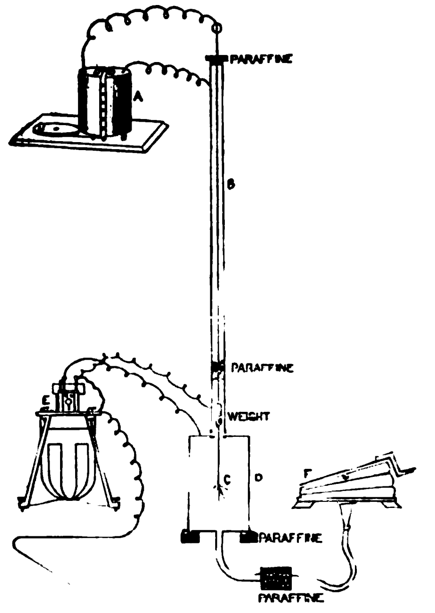
ELECTRIFICATION AND DISELECTRIFICATION OF AIR AND OTHER GASES.

BY LORD KELVIN, MAGNUS MACLEAN, AND ALEXANDER GALT.

[*Abstract.*]

§ 1. The experiments were made for the purpose of finding an approximation to the amount of electrification communicated to air by one or more electrified needle points. The apparatus consisted of a metallic can 48 cms. high and 21 cms. in diameter, supported by paraffine blocks, and connected to one pair of quadrants of a quadrant electrometer. It had a hole at the top to admit the electrifying wire, which was 5·31 meters long hanging vertically within a metallic guard tube. This guard tube was always metallically connected to the other pair of quadrants of the electrometer and to its case, and to a metallic screen surrounding it. This prevented any external influences from sensibly affecting the electrometer, such as the working of the electric machine which stood on a shelf 5 meters above it.

§ 2. The experiment is conducted as follows: One terminal of an electric machine is connected with the guard tube and the other with the electrifying wire, which is let down so that the needle is in the center of the can. The can is temporarily connected to the case of the electrometer. The electric machine is then worked for some minutes, so as to electrify the air in the can. As soon as the machine is stopped the electrifying wire is lifted clear out of the can. The can and the quadrants in metallic connection with it are disconnected from the case of the electrometer, and the electrified air is very rapidly drawn away from the can by a blowpipe bellows arranged to suck. This releases the opposite kind of electricity from the inside of the can, and allows it to place itself in equilibrium on the outside of the can and on the insulated quadrants of the electrometer in metallic connection with it.



Connected with guard screen (not shown in diagram).

Fig. 1.

§ 3. We tried different lengths of time of electrification and different numbers of needles and tinsel, but we found that one needle and four minutes of electrification gave nearly maximum effect. The greatest deflection observed was 936 scale divisions. To find from this reading the electric density of the air in the cans, we took a metallic disk, of 2 cms. radius, attached to a long varnished glass rod, and placed it at a distance of 1.45 cm. from another and larger metallic disk. This small air condenser was charged from the electric light conductors in the laboratory to a difference of potential amounting to 100 volts. The insulated disk thus charged was removed and laid upon the roof of the large insulated can. This addition to the metal in connection with it does not sensibly influence its electrostatic capacity. The deflection observed was 122 scale divisions. The capacity of the condenser is approximately $\frac{\pi \times 2^2}{4\pi \times 1{\cdot}45} = \frac{1}{1{\cdot}45}$. The quantity of electricity with which it was charged was $\frac{1}{1{\cdot}45} \times \frac{100}{200} = \frac{1}{4{\cdot}35}$ electrostatic unit. Hence the quantity to give 936 scale divisions was $\frac{1}{4{\cdot}35} \times \frac{936}{122} = 1{\cdot}7637$.

The bellows was worked vigorously for two and a half minutes, and in that time all the electrified air would be exhausted. The capacity of the can was 16,632 cubic centimeters, which gives, for the quantity of electricity per cubic centimeter, $\frac{1.7637}{16{,}632} = 1{\cdot}06 \times 10^{-4}$. The electrification of the air in this case was positive; it was about as great as the greatest we got, whether positive or negative, in common air when we electrified it by discharge from needle points. This is about four times the electric density which we roughly estimated as about the greatest given to the air in the inside of a large metal vat, electrified by a needle point and then left to itself, and tested by the potential of a water-dropper with its nozzle in the center of the vat, in experiments made two years ago and described in a communication to the Royal Society of date May, 1894.*

§ 4. In subsequent experiments, electrifying common air in a large gas-holder over water by an insulated gas flame burning within it with a wire in the interior of the flame kept electrified by an electric machine to about 6,000 volts, whether positively or negatively, we found as much as $1{\cdot}5 \times 10^{-4}$ for the electric density of the air. Electrifying carbonic acid in the same gas-holder, *whether positively or negatively*, by needle points, we obtained an electric density of $2{\cdot}2 \times 10^{-4}$.

§ 5. We found about the same electric density (2.2×10^{-4}) of *negative* electricity in carbonic acid gas drawn from an iron cylinder lying horizontally, and allowed to pass by a U-tube into the gas-holder without bubbling through the water. This electrification was due probably not to carbonic acid gas rushing through the stopcock of the cylinder, but to bubbling from the liquid carbonic acid in its interior, or to the formation of carbonic acid snow in the passages and its subsequent evaporation. When carbonic acid gas was drawn slowly from the liquid carbonic acid in the iron cylinder placed upright, and allowed to pass, without bubbling, through the U-tube into the gas-holder over water, no electrification was found in the gas unless electricity was communicated to it from needle points.

§ 6. The electrifications of air and carbonic acid described in Sections 4 and 5 were tested, and their electric densities measured by drawing by an air pump a measured quantity of the gas† from the gas-holder through an indiarubber tube to a receiver of known efficiency and of known capacity in connection with the electrometer. We have not yet measured how much electricity was lost in the passage through the indiarubber tube. It was not probably nothing; and the electric density of the gas before leaving the gas-holder was no doubt greater, though perhaps not much greater, than what it had when it reached the electric receiver.

§ 7. The efficiency of the electric receivers used was approximately determined by putting two of them in series, with a paraffine tunnel between them, and measuring by means of two quadrant electrometers the quantity of electricity which each took from a measured quantity of air drawn through them. By performing this experiment several times, with the order of the two receivers alternately reversed, we had data for calculating the proportion of the electricity taken by each receiver from the air entering it, on the assumption that the proportion taken by each receiver was the same in each case. This assumption was approximately justified by the results.

§ 8. Thus we found for the efficiencies of two different receivers respectively 0.77 and 0.31 with air electrified positively or negatively by needle points: and 0.82 and 0.42 with carbonic acid gas electrified negatively by being drawn from an iron cylinder placed on its side. Each of these receivers consisted of block tin pipe, 4 cms. long and 1 cm. diameter, with 5 plugs of cotton-wool kept in position by 6 disks of fine wire gauze. The great difference in their efficiency was no doubt due to the quantities of cotton-wool being different, or differently compressed in the two.

§ 9. We have commenced and hope to continue an investigation of the efficiency of electric receivers of various kinds, such as block tin, brass and platinum tubes from 2 to 4 cms. long and from 1 mm. to 1 cm. internal diameter, all of smooth bore and without any cotton-wool or wire gauze filters in them; also a polished metal solid, insulated within a paraffine tunnel. This investigation, made with various quantities of air drawn through per second, have already given us some interesting and surprising results, which we hope to describe after we have learned more by further experimenting.

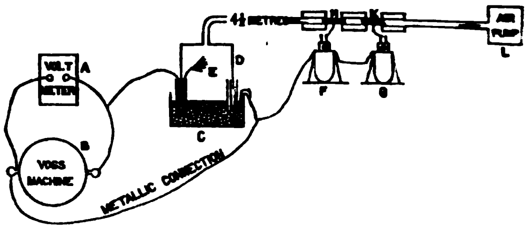


Fig. 2.

§ 10. In addition to our experiments on electric filters we have made many other experiments to find other means for the diselectrification of air. It might be supposed that drawing air in bubbles through water should be very effective for this purpose, but we find that this is far from being the case. We had previously found that non-electrified air drawn in bubbles through pure water becomes negatively electrified, and through salt water positively. We now find that positively electrified air drawn through salt water has its electrification diminished but not annulled, if the primitive electrification is sufficiently strong. Negatively electrified air drawn in bubbles through pure water, and positively electrified air drawn through salt water, has its electrification augmented.

§ 11. To test the effects of heat we drew air through combustion tubes of German glass about 150 cms. long and 2½ or 1½ cms. bore, the heat being applied externally to about 120 cms. of the length. We found that, when the temperature was raised to nearly a dull red heat, air, whether positively or negatively electrified, lost little or nothing of its electrification by being drawn through the tube. When the temperature was raised to a dull red heat, and to a bright red, high enough to soften the glass, losses up to as much as four-fifths of the whole electrification were sometimes observed, but never complete diselectrification. The results, however, were very irregular. Non-electrified air never became sensibly electrified by being drawn through the hot glass tubes in our experiments, but it gained strong positive electrification when pieces of copper foil, and negative electrification when pieces of carbon, were placed in the tube, and when the temperature was sufficient to powerfully oxidize the copper or to burn away the charcoal.

§ 12. Through the kindness of Mr. E. Matthey, we have been able to experiment with a platinum tube 1 meter long and one millimeter bore. It was heated either by a gas flame or an electric current. When the tube was cold, and non-electrified air drawn through it, we found no signs of electrification by our receiver and electrometer. But when the tube was made red or white hot, either by gas burners applied externally or by an electric current through the metal of the tube, the previously non-electrified air drawn through it was found to be electrified strongly positive. To get complete command of the temperature we passed a measured electric current through 20 centimeters of the platinum tube. On increasing the current till the tube began to be at a scarcely visible dull red heat we found but little electrification of the air. When the tube was a little warmer, so as to be quite visibly red hot, large electrification became manifest. Thus 60 strokes of the air-pump gave 45 scale divisions on the electrometer when the tube was dull red, and 395 scale divisions (7 volts) when it was a bright red (produced by a current of 36 amperes). With stronger currents, raising the tube to a white-hot temperature, the electrification seemed to be considerably less.

---

*Papers read at the British Association Meeting, September 11-17, 1895.

* "On the Electrification of Air," by Lord Kelvin and Magnus Maclean.

† The gas-holder was 38 cms. high and 81 cms. in circumference. Ten strokes of the pump raised the water inside to a height of 8.1 cms., so that the volume of air drawn through the receivers in the experiments was 428 cubic centimeters per stroke of the pump. This agrees with the measured effective volume of the two cylinders of the pump.

AN IMPROVED PORTABLE PHOTOMETER.

BY W. H. PREECE AND A. P. TROTTER.

[The first part of this paper appeared in last week's issue.]

The color difficulty is reduced, in the first instance, by the freedom of motion of the levers. The handle may be quickly moved to and fro on each side of the true reading, and the middle position may be estimated. In measuring the illumination due to arc lamps, the color difficulty becomes troublesome. The color of the glow lamp in the photometer should be approximately a mean between the color of the standard of light wherewith the instrument is calibrated and that of an arc lamp. This halves the difficulty, which can never be entirely removed, since differently colored lights are not physically comparable; it may, however, be relegated entirely to the laboratory by the use of a colored screen and diaphragm.

If the hinged screen be painted pale blue, some of the yellow rays of the lamp in the photometer are absorbed, and the reflected rays approximate to gray, that is, to feebly illuminated white. On the other hand, if the diaphragm is tinted yellow, the white light from electric arcs or of daylight may be reduced to approximately the same color as that of the lamp in the photometer. In the first case the illumination of the hinged screen is reduced, and a brighter lamp would have to be used to restore the true value of the scale readings, and in the second case the illumination of the diaphragm would be reduced, and the scale readings would be too high. But by tinting both screens the calibration of the instrument need not be disturbed. The screen being colored pale blue and the diaphragm pale yellow, there is no difficulty in obtaining disappearance of the hole in the diaphragm when illuminated by arc light, or even by daylight. The selection of the colors suitable for obtaining a true measurement is based upon the mean of a number of measurements. White screens are used, and a dull day should be chosen. If the measurement is made at midday, the color will not alter appreciably during the calibration. A number of measurements are made with quick oscillations of the handle, and the mean is taken. Several screens and diaphragms of different tints being in readiness, pairs are tried, and a selection is made of a pair which give a good color match, and, if possible, the mean reading given by the white screens. A slight departure from the mean could be corrected by the use of a coefficient. It is not suggested that strongly colored lights can be scientifically compared in this manner, but only that the yellowish light of a glow lamp can be compared with the whitish light of an arc or of subdued daylight. We employed this device in 1884, and Messrs. G. W. and M. R. Patterson, the translators of Palaz's "Industrial Photometry," who have used it in connection with a Lummer-Brodhum photometer, remark* that "it can, of course, give no additional absolute accuracy to the photometric measurements; it, however, adds greatly to the comparative accuracy of the results, as it makes it possible to measure relative intensities under various conditions with great precision." But it should be observed that the selection of the tints may be made at leisure, and under favorable laboratory conditions, and by thus avoiding all color trouble during ordinary use of the photometer a very considerable gain in precision is secured.

The scale is 5¼ inches (137 mm.) long, and is shown in Fig. 3. With the smaller of the two lamps, the highest reading is equivalent to one candle at a foot, with the larger lamp it is twice this illumination. The oscillations of the handle generally extend, at first, over two scale divisions, and after three or four oscillations their amplitude may be reduced to about one scale division. The half of a scale division may be estimated except at the highest part of the scale, which is slightly contracted. The precision is about 2 or 3 per cent. The contraction of the upper part of the scale is intentional, and is caused by the arrangement of the levers.

In case of renewal of the lamps, it is very important that other lamps should be placed in exactly the same optical position in the photometer; otherwise the scale would have to be re-calibrated. In order to fix the height of the lamps, which is the only adjustment necessary, a sheet metal screen, shown by dotted lines in Fig. 1, is placed in a holder attached to the floor of the photometer. Two small holes are drilled in this screen, and a white paper screen having a black horizontal line is fastened to the end of the box (see Fig. 1) opposite to the lamps. The hinged screen being lifted by the levers out of the way, "pin hole images" of the filaments are thus thrown on to this screen, and the lamps being set (see Fig. 2) so that the single horseshoe filament appears nearly closed up, the dark line between its two limbs is made to fall on the black horizontal line. The images being magnified, considerable accuracy is possible.

FIG. 3.

Although the principal object of this photometer, as of those which preceded it, is the measurement of illumination, it is sometimes desirable to measure the candle-power of a lamp in the street without removing it from its position. By the use of a graduated arc, such measurements can be made with the present photometer. A quadrant is fastened to the side of the photometer, and a pin at the center, from which the quadrant is struck, acts as a gnomon. A spirit level on the top of the instrument being adjusted, the angle of incidence may be read in degrees on the quadrant, and at the same time the cosine of this angle may be read on an adjacent scale. It is necessary to find the slant height or direct distance from the source of light to the photometer.

To measure the vertical height of the light, set the photometer so that the shadow falls on 45°. Measure the distance from the pin to the lamp horizontally, and from the pin to the ground vertically. The sum of these distances is the height of the actual source of light. This can be measured to about 2 per cent., say 3 inches in 12 feet 6 inches.

To find the slant height at any distance, the height of the light being known, divide the height of the lamp above the photometer by the cosine of the angle of incidence, the quotient is the slant height required; or the horizontal distance may be measured, and the square of this distance added to the square of the height of the light. This gives the square of the slant height.

To find the candle-power, the illumination in units of a candle at a foot being observed, the light from other lamps being carefully screened, the slant height being known: Multiply the illumination by the square of the slant height, and divide by the cosine of the angle of incidence.

On hilly ground it is necessary to know the height of the lamp above the photometer at each point of measurement. It is best, in that case, merely to record the angles, and afterwards to find the tangents. The horizontal distance between the photometer and the lamp-post, divided by the tangents, gives the required height.

It may be observed that when the square of the slant height in feet is equal to the cosine of the angle of incidence, the scale graduated in units of a candle at a foot becomes a scale of candle-power, and when the square of the distance in feet is ten 100 or 1,000 times the cosine, the multipliers ten 100 or 1,000 may be used to convert it into a scale of candle-power. The square of the slant height being known, the photometer may be tilted until the required cosine is indicated by the shadow of the pin. If the slant height is measured by the sum of the squares of the horizontal distance and of the height, the square is at once obtained.

We have calibrated our photometers, either by standard candles or by sub-standard glow lamps supplied from secondary batteries, or by the amyl-acetate standard lamp or Hefner unit. This standard, which is well recognized in physical work, is 0·877 of a standard candle, or a standard candle is 14 per cent. more than an amyl-acetate lamp. Placed at 1 foot distance from and perpendicular to the diaphragm, the photometer being placed on its side, the illumination is 0·876 of a candle at a foot. If it is brought to a distance of 11¼ inches ($\sqrt{0.877 \text{ foot}}$) it is equivalent to one candle at a foot. But this distance and position is inconvenient. If it is placed at a distance of 1 foot, and at an angle of incidence of 55° 10′, the illumination on the diaphragm is one-half of a candle at a foot, since cos 55° 10′ = ·57 and ·57 × ·877 = ·5. A mark is therefore made at this angle on the quadrant, and is inscribed H.U.= ½ C. P. Considerable experience with the use of small glow lamps supplied from portable secondary batteries has given us great confidence in this kind of secondary standard of candle-power. The battery is always freshly charged before each evening's work, and is discharged for half an hour before use. The lamps are only turned on while an observation is being taken.

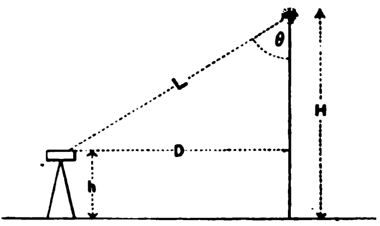

FIG. 4.

The 1883 photometer was arranged to be held in the hand; our 1884 photometer stood on a tripod about 2 feet 6 inches from the ground. The street measurements made in 1892 were all made with a photometer placed on the ground, the diaphragm being about 6 inches from the pavement. The proper height for an illumination photometer is a matter of opinion. When the photometer is placed on the ground, the large number of measurements required for a thorough photometric survey of a street or empty building can be quickly made. For some purposes—for example, an exhibition or a church—a stand is necessary; the calculations of candle-power become rather more tedious.

The various observed and computed quantities may be expressed as follows:

D = horizontal distance from photometer to lamp post.
L = slant height from photometer to light.
H = height of light above the ground.
h = height of the photometer diaphragm from the ground.
θ = the angle of incidence.

---

* "A Treatise on Photometry," Palaz, American translation, Appendix, p. 312.

c.f. = illumination of units of a candle at a foot.
c.p. = candle-power.

$$\mathrm{H} - h = \mathrm{D} \div \tan\theta.$$

$$\mathrm{L} = (\mathrm{H} - h) \div \cos\theta.$$

$$= \sqrt{\mathrm{D}^2 + (\mathrm{H} - h)^2}.$$

$$c.p. = \frac{c.f. \times \mathrm{L}^2}{\cos\theta}.$$

The following is an example of the measurement of the illumination and candle-power in the case of a street-lamp:

D	θ	c.f.	tan θ	cos θ	H − h	H	L	L²	c.f. × cos θ	c.p.
20	66°	0·025	2·25	0·407	8·9	11·3	21·8	475	0·0614	29

OTHER PAPERS READ AT THE BRITISH ASSOCIATION MEETING.

Lord Kelvin's Portable Electrometer.

Professor Schuster described some observations with Lord Kelvin's portable electrometer.

The instrument used had, after ten years' usage by students, been subjected to all the rough treatment experienced on a Continental journey, including such things as glissading down snow slopes; it was nevertheless in working order, and had thus established a claim to the title "portable." In using it he had found difficulties from bad fuses and alterations of zero due to temperature. His object had been to estimate the atmospheric potential near the earth's surface at various points, in order to discover the laws of its variation with the configuration and nature of the surface, and the influence of disturbing causes. At Pontresina he found a mean potential of 30 volts in the valley (all the charges given are positive); at a higher but more protected place the potential was 62 on the same day. On ascending to the top of the pass a reading of 147 was obtained at a place with rocks on either side, while on descending slightly to a more exposed situation the potential was only 116. At an altitude of 12,000 feet above the sea level a reading of 816 was obtained; on descending 200 feet to 300 feet below the summit the value fell to 170. Above Pontresina, on an open plain, a potential of 357 was obtained. These figures did not appear to follow any obvious law, and the protective action of surrounding rocks in screening a point from electric charge did not seem to be very great. He found that the wind from a waterfall or glacier was invariably negative, and that the normal positive electrification at the foot of a glacier was increased by a strong wind blowing down the glacier. He wished to inquire whether Lord Kelvin had investigated the effect of the presence of one's body on the indications of the instrument.

Lord Kelvin said he had shown, at the Aberdeen meeting in 1858, how two instruments might be used to determine the effect of the body.

Professor Michie Smith said he had observed in India as high as 8,600 feet, always finding a positive electrification, the magnitude of which depended on the amount and direction of motion of the mists. He found the portable electrometer difficult to manage in the tropics, as the excessive moisture spoiled the insulation. Like Professor Schuster, he had found a temperature error, variable both in amount and sign.

Professor Ayrton thought the instrument ought to work in the tropics. He attributed temperature errors to unequal expansion of the various metals used in the instrument.

Indian Thunderstorms.

Professor Michie Smith read a paper on "Indian Thunderstorms," describing the results of his observations made at Madras. Here, he said, sheet lightning occurs every evening for several months, always near the horizon and directed towards the southwest. The time of occurrence varies from day to day, but is always evening, and generally not later than 9 P. M. It is not a reflection of distant lightning flashes, but consists of an actual discharge of electricity from cloud to cloud, or between two portions of the same cloud, and it takes place in the upper portions of low-lying clouds. When morning lightning occurs its direction is northeast. Hence the lightning is always to be looked for in the regions of still air, where the land and sea breezes meet. The time of occurrence depends on the hour when the sea breeze sets in, the display being about three hours later than this. Cumulus clouds rise together in pairs, and the discharge takes place between them, sometimes possibly within them. He thought the electrical conditions of the clouds might be accounted for by the fact that the sea breeze is moist and dustless, while the land breeze is dry and dusty. It is known that the air is negatively electrified relatively to the ground when the air and earth are both dusty, while the sea breeze brings a strong positive electrification. The equalization of the electric conditions of these clouds will result in sheet lightning. The presence of dust in the clouds is shown when they sink rapidly; the dust is then seen at their edges, and gives the iridescent or nacreous appearance frequently observed.

Mr. John Aitken said his observations on the Rigi confirmed Professor Michie Smith's theory. He believed thunderstorms resulted from an influx of pure air into dusty regions; the thunderstorm was the effect of purifying the air, not the cause of it. In support of this view he gave an instance of thunderstorms occurring for several days in succession without any apparent purification of the air; eventually the air was purified and the thunderstorms ceased.

Professor Schuster said he had counted 25 new theories of thunderstorms, all put forward during the past twelve years; in some years as many as four or five theories had been proposed. In connection with the electrification of air he thought Lenard's observation of the electricity of waterfalls was important. Lenard found that the air coming from the spray of a fall of pure water was charged negatively; that from salt water, on the other hand, is positively electrified. This accounts for the positive charge of the sea breeze. He thought the dust in air was generally gathered up locally, excepting that at high levels as in the case of the Krakatoa eruption. He supposed Professor Michie Smith would not deny the possibility of nacreous clouds being due to a current of air rising through the stationary cumulus cloud. He had often observed nacreous clouds in England, when the light was favorable, but he had connected them with cirrhus rather than cumulus clouds, and attributed their iridescence to ice particles instead of dust.

Professor Michie Smith, in reply, said that the iridescence of nacreous clouds occurred so near the edge of the cumulus and fitted it so closely that he regarded the phenomenon as produced by it.

The Telephone in Europe.

Two papers were read on telephonic matters, one by Mr. A. R. Bennett, comparing the systems of various Continental countries with those operating in England. He considered the services provided in Great Britain as being far behind many European cities both in matters of size, efficiency and rentals. He stated that the United Kingdom came tenth on the list he had prepared. It appeared with 59,569 exchange telephones with 636 persons to each telephone. He sums the characteristics of the service of the United Kingdom as follows: "High rates with regulations unfavorable to development outside towns, local management in part, practically no competition."

He divided the countries of Europe into three groups: (1) well telephoned, (2) indifferently telephoned, (3) badly telephoned. He presented with his paper a table showing that telephonic prevalence is proportional to the prevalence of the following features: (1) low rates, (2) local management, (3) facilities for rural intercourse, (4) dompetition.

The other paper was by Major-General Webber, who took as his subject "The Development of the Telephone Service in Agricultural Districts." He drew attention to the probability that the telephone, as well as light railways, might be beneficial to rural districts. He exhibited a map of Suffolk, in which every town, village, or hamlet where a post office was situated was marked. At each of these he suggested that a telephone call office should be established, and at twenty-nine towns it was proposed that there should be telephone exchanges. It was not proposed that these lines should be constructed with so costly material as that used by the post office. If carried out by the county council the whole of the work could be tendered for and the poles supplied locally, and very little special labor would be required. The telephone would offer means of communication with salesmen, farmers, bailiffs and workmen. Small tradesmen would be able by it to keep trade in local hands, regulations of transport and carriage of all kinds would be assisted, and economies would be effected in distribution of perishable agricultural produce of all kinds. He suggested a charge of 2d. per "talk" within one exchange area; beyond and inside the county it would be 3d.

The meetings at Ipswich concluded on Wednesday, September 17, after a very successful gathering. Sir John Lister was appointed president for the next meeting of the Association, which is to be held on September 16, 1896, at Liverpool. The Association has accepted the kind invitation of Toronto to hold its 1897 meetings there.

PHASING TRANSFORMERS.*

BY CHARLES S. BRADLEY.

On account of the large number of single-phase plants in existence which were built for lighting, and with no thought at the time of running motors from these systems, it has seemed to the electrical engineer very necessary to produce a single-phase motor. Many talented men have labored and studied upon this subject, and, so far, the results have not been at all satisfactory.

During the last few years the rapid progress of the polyphase motor has been the only success. The evolution of electrical art seems to be toward the production of apparatus which shall make all systems mutually convertible; so that we may be able to convert the phases produced into a greater or lesser number; starting with a generator of three phases, we shall be able to produce from it two or one. Again, generating two phases, we shall be able to convert it into three phases or one. Again, starting with a single-phase generator, we shall be able to convert it into two or three phases.

The polyphase motor is so good as to need but very little if any improvement, but this is so familiar to the Institute that I need not go into details. I think the time is not far distant when we shall be able to fill out with the alternating currents any engineering problem that may be required of us. We will be able to take old plants and modify them to do any work which may be necessary. One of the important links to round out the art seems to be the phasing transformer, so that we can take a single-phase alternating current and convert it into polyphase of any desired number.

I have chosen for my work the conversion of single phase to three-phase, because the three-phase motors which we have been able to construct give us very much less trouble than the two-phase. In a series of experiments, I have found that the two-phase motor would run at a number of speeds, especially when supplied with current from a phasing transformer. I supposed the trouble arose from harmonics, but of this I am not certain. The triphase motor never has given us any of this trouble. These experiments, however, were carried out before the transformers had been refined; and, now that we are getting more perfect results, I think it is very probable that we could return to the two-phase motor and get much better results than when first tried. The following is a description of an arrangement of condensers and cores to produce polyphase and single phase alternating currents. Many different arrangements of condensers and inductances have been tried, and all have failed to keep their phases at a working relation, except the one I am about to describe.

---

* A paper presented at the Ninety-ninth Meeting of the American Institute of Electrical Engineers, New York, September 25, 1895.

A diagram of the phasing transformer and connections with the generator and motor will be found in Fig. 1, A being the generator, B the simple section of the transformer, D the condenser, and M the motor; *r*, primary of the simple section of the transformer; *n* and *l*, primary of the compound section; *g*, *h* and *i*, secondaries of the simple section of the transformer, and *j* and *k*, secondaries of the compound section. The primary of the simple section of the transformer is in series with the compound section and condenser. By the proper adjustment of capacity and inductance, the magnetic flux in the core of the compound section is approximately 90 degrees in phase behind the simple section; then, in order to get three phases from the two, I resort to resultants in the secondaries: *g* and *k* constitute one phase, *h* and *j* a second, and *i* the third. The essence of this invention rests in the arrangement of the compound section of the transformer and condenser. There are, undoubtedly, several ways of explaining the theories involved in this device, and most people would prefer the mathematical description, but, as I did not hit upon the invention by that method, I shall follow in the explanation the same method of reasoning as I used to arrive at the result. In order to explain the theory involved in this, refer to Fig. 2, in which A is the generator, E the inductance, D a condenser or capacity; *l* and *n* represent the leads to the inductance E and to the capacity D. If the generator is generating an electromotive force in the direction of the arrow, Fig. 2, a current will flow through the lead *l* and the inductance E, as represented by the arrow prime, and through *n* into D, in the direction of the arrow second, as indicated by the curves in Fig. 3; that is, during the rise of the electromotive force through the machine from the point *o* to the top of the wave at *p*, the current will flow in parallel into or through the inductance E and the capacity D, Fig. 2. As soon as the wave of the electromotive force commences to decline from the point *p*, the condenser will begin to discharge, and the current flowing from it will be in the direction of the arrow third, Fig. 2. Also, at the same time, the inductance will discharge its energy by a current in the direction of arrow third, so that the current represented by arrow third will cross the zero line at point *t*, Fig. 3, or is delayed by a time equal to 90 degrees. Thus we see that the current represented by arrow third will be lagging in its time period considerably behind that in the lead *r*, represented by curve *o-p*. Now, if we wind the lead *l* and the lead *n* upon an iron core, as shown in Fig. 4, in opposite directions and of the same number of turns, and have the inductance E bear a proper relation to the capacity D, so that the currents represented by arrow prime and arrow second shall be equal, no magnetic flux will be produced in the core during the rise of the potential of the machine from *o* to *p* on the curve, but during the fall of the electromotive force of the machine and during the discharge of the inductance and condenser which is represented by arrow third, Fig. 2, the currents flowing through *n* and *l* will be in series and flowing in the same direction; consequently, the magnetic flux will be approximately 90 degrees later than it would be if charged directly from the machine. I have represented in Fig. 2 a section of lead by *r*, and it will now be clearly seen that the current in the lead *r* will have a phase difference from the combined or resultant phases in the leads *l* and *n*. Furthermore, a current in the lead *r* will be in lead of the electromotive force of the machine, because the inductance and the condenser, previously described, cut off the flow of the current before the machine has reached the zero point and when the lead *r* is placed upon an iron core, as shown in Fig. 4, it has a tendency to lag, which counterbalances the lead and leaves the main line current somewhere near the phase with the E. M. F. of the generator.

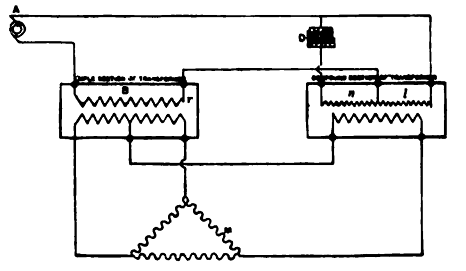

FIG. 1.

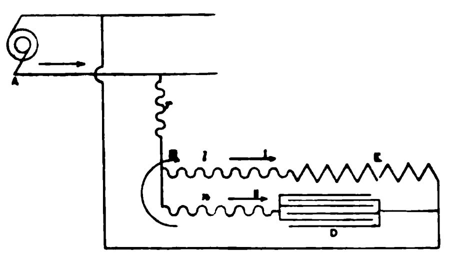

FIG. 2.

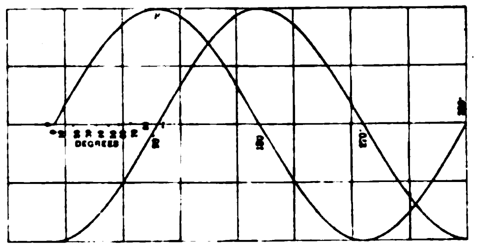

FIG. 3.

Please refer now to Fig. 4, where the leads *l* and *n* are wound in opposite directions, and completely interlaced upon the iron core L, the generator, inductance and capacity being indicated by the same symbols as in previous Figures. The lead *r* is here wound upon the second iron core, which constitutes the primary of the simple section of the transformer as shown at B, Fig. 1. In reducing to practice and applying the transformer to an induction motor, we find that the inductance E can be dispensed with, as the apparent inductance produced by the motor furnishes all the lag necessary; and it will be noted that in Fig. 1 the extra inductance which we used in our first experiments is left out of the combination. The lead from the simple section of the transformer, it will be noted, goes to the center of the compound section. This diagram does not represent the true condition of the compound section, for the winding *n* and *l* are together, or, as before mentioned, interlaced upon the core. The magnetic flux in the two sections of the transformer are approximately 90 degrees apart. The secondaries are, therefore, wound each partially upon the two cores, so that the three resultant phases may be produced from two, this being in accordance with Mr. Fred. S. Hunting's invention for changing two phases to three. For the description of this I will quote Mr. Hunting's own words, and the plan is in Fig. 5.

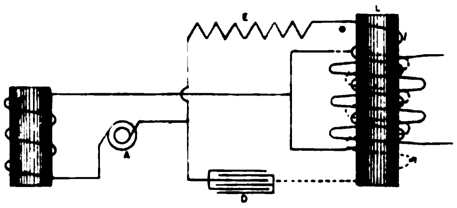

FIG. 4.

"If P^1 and P^2 represent two primary circuits supplied respectively with alternating currents differing in phase, or disposed in any other suitable manner so that the fluctuating magnetic impulses developed in the cores M^1 and M^2 differ in time, then the secondary currents developed in circuits S^1 and S^2 will differ in time period. If other circuits, as S^3 and S^4, be so arranged that part of their convolutions will enclose one magnetic core and part another, there will be developed in these circuits a resultant current due to the combined action of both magnetic cores, and this current may be given any desired degree of phase displacement with reference to the current in primary coils P^1 and P^2, accordingly as the number of convolutions surrounding the respective cores are varied. For example, if, as shown in circuit S^4, an equal number of convolutions is placed around each core, then there will be developed in circuit S^4 a resultant current having its phase half way between the phase of current in coils P^1 and P^2. If the number of convolutions on the two cores vary in the proportion of three to two, and be joined together as indicated by the coils S^3, the resulting current produced by these coils will be closer in phase to the current flowing in P^1, providing the larger number of convolutions be placed as indicated in the diagram upon the magnetic core controlled by coil P^1. Thus, by varying the relative proportions of the two coils inclosing the two magnetic circuits, a resulting current of any desired phase displacement with reference to the phase of coils P^1 and P^2 may be developed. It will thus be seen that by means of two magnetic circuits or cores in which magneto-motive forces differing in phase are developed, we may produce any desired number of currents of differing phase, and may produce a definite degree of phase displacement, and the resultant current may in any case be shifted closer to the phase of magneto-motive force in either core by increasing the inductive influence of said core upon the circuit carrying the resultant current.

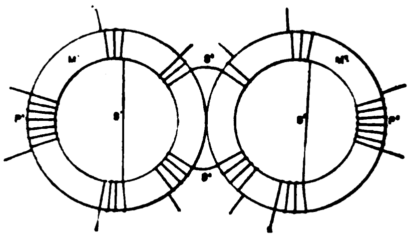

FIG. 5.

"In the organization shown in the diagram we will have four secondary currents developed from the primary coils P^1 and P^2, and assuming that the currents flowing through these coils differ in phase, all of said secondary currents will differ in phase."

Mr. Scott's invention for changing two phases to three may also be used, and is shown in Fig. 6. Making the resultants in this manner by means of the secondary windings contributes also to steadiness of phasing. If desired, two secondaries having a proper two-phase relation may be used on the motor.

The experimental work, in which I have been greatly assisted by Messrs. Hulse and Chapman, has occupied a long time and has passed through a great many stages. The results represent a great deal of patience, and we have chased the phases from zero to 180 degrees, back and forth, until there is a well-worn path between these two points, but finally we have a set of beautiful results, and the electromotive force curves will be found in Fig. 7, taken from the transformer, in connection with a half-horse-power motor, running at full load, and Fig. 8 gives the current curves of the same. This motor gives powerful starting torque, and it gives me pleasure to show it to you here in operation. I want to bring to your attention one feature of the compound coil

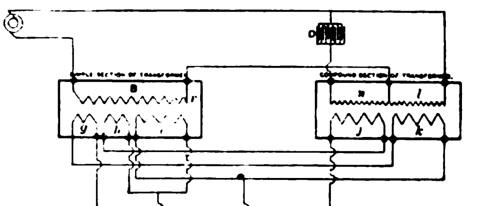

FIG. 6.

used in combination with the condenser, which will be found in Figs. 9 and 10. If we suppose a direction of motion, as shown by the arrow and the current in the condenser branch, leads by 90 degrees, which is represented at *b*, and the current in the inductance branch lags by 90 degrees, as indicated at *c*, and the wires carrying these currents are wound in opposite directions upon the core, we will have a resultant current which is represented by extension *d*. Increase of load changes the phase relation of the individual branches, but not the resultant secondary, and this is explained by reference to Fig. 10, where a 75 degree lead and a 75 degree lag are represented by the respective branches, and as the branches are wound in opposite directions we find that when *b* is turned over it becomes a lag of 105 degrees, and the resultant of 75 degrees and 105 degrees again produces 90 degrees lag, and the value again represented by the extension *d*; the value of the current is slightly less, but its resultant phase is the same as is represented in Fig. 9. This explains the steadiness of phasing which we are able to obtain. This may be explained by another method of diagramming as is shown in Figs. 11 and 12, where curve *a* represents the fundamental current, curve *b*, Fig. 11, a lead of 90 degrees, curve *c* a lag of 90 degrees, and then *b* being turned over unites with *c* to produce the resultant *d*, which is 90 degrees in lag of fundamental curve *a*. Now, in referring to Fig. 12, where the fundamental current is again represented by *a*, curve *b* represents a lead of 75 degrees, and full line curve *c* represents a lag of 75 degrees; then, when curve *b* is turned over in the windings, as shown in the dotted line, the coils being wound upon the same core, a resultant effect is represented by the curve *d*, which is 90 degrees in phase from fundamental curve *a*. Thus we see by increase of load, which tends to decrease the lead of the condenser circuit, and also decreases the lag of inductance circuit, our resultant is still in the same phase relation to the fundamental current.

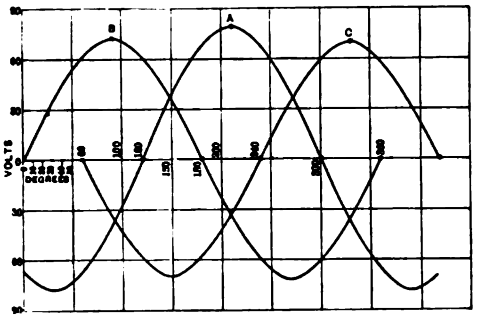

FIG. 7.—E. M. F. CURVES.

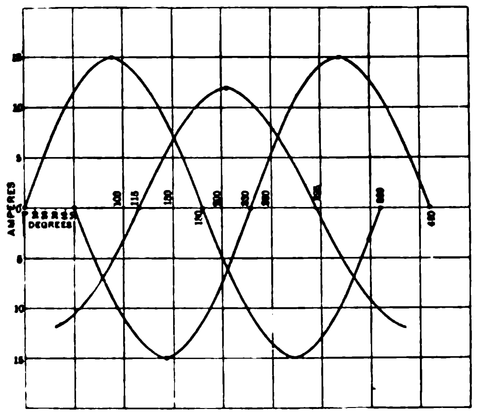

FIG. 8.—CURRENT CURVES.

The power factor is found to be very good, the current in the main line feeding the transformer varying from 10 degrees lead at full load to 35 degrees lag at no load, and the motor at starting producing the same effect as when working at full load; so that we have very good phasing for starting and full load, as well as a good power factor, it being 82 per cent. even at light loads, and the probability is that we will have very much better results upon larger-sized transformers.

The condenser in this combination fills two very important functions, first assists in the phasing and second prevents the lag upon the line. This arrangement does not prevent the idle currents flowing in the motor circuits and the secondaries of the phasing transformer, and we find in small motors with the high period of 140 cycles that the apparent energy in the motor circuits is sometimes two and one-half times the apparent energy in the main line. The capacity of condenser for a one-half horse-power motor when 1,000 volts are supplied to the transformer is about 2.4 microfarads. Our condenser for this size, without connections, occupies a space of a cube four inches on each side, and capable of enduring 3,000 volts, or a factor of safety of four, as the voltage on the condenser is about 700. Of course, it will be understood by those familiar with the designs of induction motors that it is impossible to design a small motor with small power factor, as the air-gap necessary for mechanical construction has to be so large in proportion to the size of the motor.

Many attempts have been made by placing the condenser in direct connection with motors to produce rotary fields, but have so far been attended with little success; as the trade requires the motor to be of comparatively low voltage, which calls for a large capacity in the condenser, and as the output of the condenser of a given capacity is proportional to the square of the voltage, it will be seen how advantageous it is to place the condenser in combination with the primary of the step-down transformer.

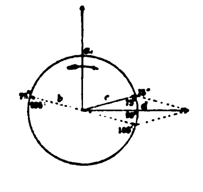

FIG. 9.

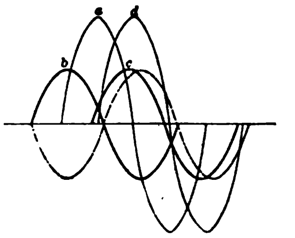

FIG. 11.

It may seem trite to call your attention to the fact that the transformer reduces the voltage at the same time it does the phasing, but I think it is so important that I wish particularly to emphasize the fact. It is also of great importance that the device has no moving parts.

Upon reference to the cuts showing the curves obtained of the electromotive force and current, it will be readily seen that they are all of true sine form. The current for this work was obtained from a 75 K. W. Slattery alternating machine. This machine has a surface winding on the armature, and, therefore, gives practically a sine wave. Just what the transformer may do on all the various dynamos that are in the market, giving all sorts of complex waves, it is difficult to say with our present experience, but so far as we know now, the transformer tends to smooth out all the irregularities.

While the principal use for this device at present seems to be the application of polyphase motors to single-phase lighting systems, many new ones undoubtedly will be found. It may seem bold to think of applying this to long-distance trolley railroads, but I am hoping to have it done.

It is much more simple to have one trolley wire with track return than to have two trolley wires which would be required by the direct application of polyphase systems. A large amount of power requires either a large current or high voltage, in order that the resistance of contact of whatever device is used to make connection to line need not be too great. As viewed at present, it seems as if the alternating current must be used for this work. If so, and unless the traffic is extremely frequent, it will take many more transformers, if they be placed along the line, than if the transformation is made upon the car or locomotive, because the transformers along the line having no trains or cars near them would be idle.

If the voltage is stepped down on the car or locomotive, it is just as economical to do it by the phasing transformer, with the exception of the added weight of condensers, which for a 1,200 H. P. locomotive will be about two tons, and this is not of consequence on so large a power.

These condensers are very compact and efficient, and will stand from three to four times their working voltage without puncturing the dielectric. I am sorry I cannot show you the condenser in all its details, but for certain reasons I cannot do so at present, but will present it to the Institute at the first opportunity.

A brief description of the motor may be in order, although it does not belong strictly to this subject.

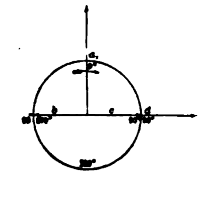

FIG. 10.

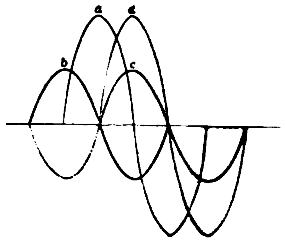

FIG. 12.

We met with much difficulty in developing a motor for so high a periodicity as 140 cycles. It is necessary to keep the density so low, and it is always such a temptation to try to get all the power from a given piece of apparatus, that they are always heating much more than they should.

With a large number of poles and slots, we found that any use of wide bars in the armature was out of the question, for the eddying currents in the copper were too serious. *We also looked for difficulties which we never found.* At times we thought the heating was due to higher harmonics produced from the phasing transformer; but the fact is, we never found any, unless it was in the experiments upon the two-phase motor. As mentioned before, the waves are all of the true sine form.

Cuts of the motor are shown in Figs. 13 and 14, the rotary field being the exterior or stationary part, and the secondary or induced constituting the armature. The armature is composed of two sections, or practically two armatures end to end upon the same shaft, one of the armatures having a low resistance winding and the other a comparatively high resistance; the field is placed over a high resistance for starting, and shifted by means of a lever over the low resistance, when it has nearly attained speed. Of course, this arrangement is for securing the starting up of the motor, and has nothing to do with the phasing transformer, and the motor might have rings for connecting the starting resistance to the armature and operate quite as well. The sliding of the field gave trouble, as the air-gap has to be small, and the play at the sides (noted 1*a* and 2*a*) allowed the armature to strike against the field, and when a tight fit was made, which would work easily when cold, it would stick fast when the motor rose in temperature; the writer therefore decided to give it quite a clearance at these points, and give it a guide at the bottom of the field shown at 3*a*. This being central and comparatively thin, the expansion is not sufficient to cause sticking, also the guides at 1*a* and 2*a*, being thin vertically, they may fit close and still slide easily. The lever for moving crown back and forth is shown at 4*a* Fig. 14, and 5*a* Fig. 13. It fits loosely, having a fulcrum at 6*a*.

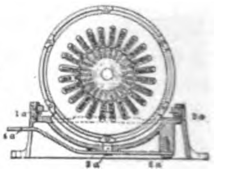

FIG. 14.

The Phoenix Telephone Company of Indianapolis, Ind., has refused to accept the ordinance recently passed by the council of Terra Haute, Ind.

Emanations from an Egoist.

PROF. FORBES SURVEYS HIMSELF AND IS FULLY SATISFIED.

How He "Harnessed Niagara."

The pest of society is egotists. . . . In the distemper known to physicians as chorea the patient sometimes turns *round* and continues to spin slowly on one spot. Is egotism a metaphysical varioloid of this malady?—*Emerson.*

Prof. George Forbes, C. E., has contributed an article to the current number of *Blackwood's Magazine*, in which he settles forever a great many disputed points in regard to the Niagara transmission scheme and the work of those connected with it. There is no longer any doubt as to who did it at all. The master mind was that of Forbes. Forbes has confessed it in 9,000 words, of which 200 are personal pronouns. Kelvin, Turrettini, Mascart, Sellers, Unwin, the Westinghouse Company, and the rest were never in it from start to finish except as disturbing elements to annoy the Master Mind.

Yet the creation of the great Niagara plant is not the Professor's crowning achievement. His glory of glories must forever be the *Blackwood's* article. We print such of it as is of especial interest to Americans, with a few brief comments, which are offered in a spirit of abject humility, as becomes an editor who at one time in his life was an American bagman:

There is no class of professional men who travel so much as engineers. Their experiences are often full of interest, and at times not devoid of excitement. Yet how seldom it is that any account of these travels is found in print. This is partly due to the fact that it all seems to the principal actor to be all in the day's work, and hardly worth committing to paper. But there is also a certain pleasure in having a store of experiences to relate to one's more intimate friends, which the vulgar crowd cannot read in a book.

At the present moment I am tempted to curb this natural reticence with the object of narrating my experiences of the last few years, which I believe are unique in our profession.

How can any one curb a natural reticence?

Our engineers are often called upon to travel in difficult countries, and to accomplish what look like impossibilities. But it is by no means an everyday occurrence for the financial men in a great country like the United States, who are not in the habit of minimizing the capabilities of their fellow-countrymen, to invite a foreigner to carry out one of the greatest works of modern times in that country. Some people say that the Americans are perhaps too much inclined to look upon their countrymen as the inventors of Electricity. It is, then, all the more surprising that the work about which the English engineer was asked to advise them was the electrical utilization of Niagara Falls. It must, however, be remembered that this work involved entirely new problems and designs, while the American electrician has less capability of evolving entirely new plans, or designing entirely new machinery, than of adapting his past experience, exactly as it stands, to new conditions. It was for this reason that one of the ablest of American engineers said in public three years ago that it was impossible to transmit the power of the Falls to Buffalo, some twenty miles, so as to make it pay; whereas we have now established the fact that the limit of distance is to be counted by hundreds of miles.

The remark of the American engineer must stand as truth until the contrary is proved. Power has not yet been sent to Buffalo. The statement that "the limit of distance is to be counted by hundreds of miles" is contrary to experience.

There are two great mistakes commonly made as to Americans. One is, that they are original inventors; the other is, that they are humorous. Neither of these propositions is true.

We yield both points to Forbes; he is the greatest inventor and the most humorous humorist of the age; and thank God he is not an American.

. . . Invention and humor require a gift of imagination, the same gift that shows itself in poetry and letters, in music, painting, and sculpture; and in no one of these directions has this gift of imagination been found to predominate amongst Americans.

In no one of these directions, save perhaps in poetry, does the Anglo-Saxon race lead; and in poetry America has no cause to be ashamed of her productions. In fact, more copies of Longfellow have been sold in England than of Tennyson.

I have given these reasons why it was perhaps natural to have recourse to a European to take hold of this great and entirely novel problem. Another reason is that all their electricians who may have had a wide practical experience are tied to manufacturing companies, and cannot be looked upon as independent either in thought or action; and since it was pretty certain that any plans that might be adopted would have much of novelty in them, and would be opposed in the first place both by scientific men and by the manufacturers, it required that the man selected should have nothing to gain or lose by the friendship or hostility of these two classes of men.

When I had finished my work at Niagara Falls the chairman (or president, as he is there called) of the company wrote me a letter, in the course of which he incidentally mentioned some of the reasons why I had been invited to carry out this work. . . .

Passing now from these digressions, let us come to the Falls themselves. I have no talent for pictorial description. . . .

Forbes is too modest. His whole article is a word-picture, a living picture, and when one finishes it the image of Forbes is fixed on his mind never to be effaced.

The village or town of Niagara Falls on the American side of the river is built of wood. It is dirty, and the streets are bad. Its industry is the catering to excursionists. Cheap restaurants, merry-go-rounds, itinerant photographers, and museums of Indian and other curiosities are the chief features. The last are mostly impostures, always excepting the world-famed "Katie & Libby's Stores," where genuine curios are to be found, and many pleasing souvenirs.

Who would dream that Forbes could have been taken in by our old friends Katie and Libby?

This village is remarkably conducive to the concoction of lies, and the Falls lend themselves to the art. . . .

We fear the Professor stayed there too long.

To me the great charm of the Falls is their immutability and change.

The drifting spray and varying light give the changes of a kaleidoscope, but the volume of water pouring over never varies. They remind me of the face of a dear friend, always the same but never two moments alike. I suppose there is nothing to compare with them in size or grandeur except the Victoria Falls of the Zambesi; and Livingstone, who never exaggerated, said that these were the finer.

. . . The old mills which used to be in the stream above the American Fall have been removed for æsthetic purposes and the land laid out with some attempt at good taste.

To what æsthetic purposes have they been devoted?

On the Canadian side the same thing was done, but I regret to say that the rapacity of the Legislature of Ontario has not proved equal to withstanding the blandishments of the greedy capitalist. Two lines of rails traverse the whole of the National Park at the edge of the gorge. After the land had been confiscated by the Government, and the owners had been paid only a fraction of its true value, it is now turned into a source of revenue by the Government, and a gold mine to the capitalists, at the expense of the visitors, who can no longer enjoy the peaceful quiet which Lord Dufferin tried so hard to give them. . . .

In 1889 the Niagara Falls Power Company was formed to carry out this work, and their first act was to buy up all the land in the neighborhood. The capital subscribed was wholly American, and amounted to £2,000,000, about one-half of which has been spent. The acting committee consisted of railway men and lawyers. The chairman, as usual, is called a president. They like giving big names to things in America. A pond is a lake, and a hill is a mountain; they never speak of the sea, it must be called the ocean; a meeting is a convention, a dictionary is a "speller and a definer."

How many Americans knew this before Prof. Forbes told them?

A town is a city, a chairman is a president, and so on. The only exception I know of is that the wealthy people who own those charming country residences at Tuxedo and Lenox call them cottages. But these are not average Americans, and in that country the manners and customs, as seen by the ordinary traveller, are governed by the average man, who is not a good specimen. He is apt to be a most awful "bounder," has no taste, and does not know the meaning of the word "repose"; but you need never meet this type except in railway trains and hotels. His ideal, as one of them told me, is to spend his nights "on the cars" and his days in getting the better of his fellow-men. But the refined American is quite different. These are mostly met in Washington and the South, and, of course, Boston is a thing apart; and as you approach this town you are told that the humming you hear is the noise of the people reading Browning. Tuxedo also is a great exception, where you can have congenial society. It is a large estate with woods and lakes and forty miles of well-laid roads. Country houses or cottages have been built all over it, and there is an excellent residential club—into which, however, the female element has progressed so far as to have introduced even babies into the bedrooms!

I must really ask to be excused for such digressions, but I must tell my story in my own way or leave it alone.

And not even the "average American" would stop you, Professor. You are a peach.

The chairman of the company which has utilized the Falls is Mr. E. D. Adams, well known as a banker and a reorganizer of railways. The first vice-president is Mr. F. L. Stetson, a lawyer who has also had much experience in the finance of railway companies. Mr. Cleveland, the U. S. A. President, is a partner in his law business. The second vice-president is Mr. E. A. Wickes, also a railway-man. The secretary and treasurer, Mr. W. B. Rankine, is one of the most able and energetic and charming men I met in the States. I only hope he will not utterly ruin his health by overwork. All these are very able business men, though not engineers, and the affairs of the company could hardly be in better hands——

Unless Forbes took charge again.

In October, 1889, the Niagara Falls Power Company was formed to carry out the great work of utilizing the Niagara Falls on so gigantic a scale that all previous attempts to use water-power at once sank into insignificance. The Cataract Construction Company was at the same time formed by the same people to carry out the work. . . .

In order to obtain more definite ideas they invited certain engineers to prepare plans of any methods they might think best. These were to be laid before a Commission of engineers and physicists from England, France, Switzerland, and America, with Lord Kelvin as chairman.

At first I declined this invitation on the grounds that the method of competition is contrary to my professional practice, and also that with so novel a problem I would not accept any man, or combination of men, to adjudicate upon the project which I might decide upon.

Having learnt, however, accidentally, that any electrical plans to be submitted would not be of a satisfactory nature, I withdrew my refusal in order that a plan, as I conceived on proper lines, might be at least in evidence. . . .

Now let me say, without explanations, that there are two kinds of electric current—a "continuous current," always flowing in the same direction, and an "alternating current," in which the direction of flow is reversed, it may be hundreds of times in a second.

I soon realized the fact that not only could the latter current be more easily obtained at high pressures, but that it could easily, and without moving machinery, be transformed to any required pressure at any spot when it was wanted.

Up to that date, **1890**, both kinds of electric current had been used for electric lighting, but the alternating current had never been used for giving mechanical power except in an experimental way. For this reason it seemed to most people absurd to suggest its use for Niagara Falls. I would have shared this view were it not that for several years I had visited the United States and the continent of Europe to study the progress that others were making in electric work. I had thus become well acquainted with the system which Nicola Tesla, a young Montenegron, was experimenting on at Pittsburg, U. S. A., called a "two-phase" system. I also had seen many things in various parts of Europe not generally known in England. Owing to these varied experiences, I HAD AN OPPORTUNITY ABOVE ALL OTHERS AT THAT DATE of foreseeing that the alternating current would soon be very generally applied not only to light, but also to motive power.

Here we must digress long enough to introduce a little correspondence between Prof. Forbes and the Westinghouse Company, in **1891**, which needs no comment.*

Acting upon this knowledge, I worked out complete plans, using only machinery which could then be got in the open market, and was able to furnish complete working plans, drawings, specifications and estimates of cost. This laborious work when concluded left no doubt in my mind that the alternating current must be adopted.

The Commission sat upon these plans, and, as I expected,

---

* (*Prof. Forbes to Mr. George Westinghouse, Jr.*)

34 Great George Street, London, S. W.,
September 19, 1891.

Dear Mr. Westinghouse: I am going to read a paper on alternate current motors. I want to emphasize the importance of your work on the Tesla motors. May I ask you kindly to allow me to have as full information as possible by instructing one of your staff to forward some details? I daresay you cannot give me all the facts I want, but if I indicate them generally perhaps you will give me some of the points. First, and most essential, I want a drawing to show the winding of the armatures, especially the unsymmetrical winding, which I saw last year. I should also like to have drawings of the complete machines, generator and motor, the dimensions, weight, speed of revolution, output and efficiency of any particular machine that you have made. What are the largest and smallest machines you have had giving good results? What is the period of alternations and e.m.f. you have used? What examples may I quote of their successful use in practice? I know that the development of the motor has been retarded by other than engineering difficulties. I am glad to learn that the financial difficulties of the company have been surmounted.

With kind regards I am, yours most truly,

GEORGE FORBES.

P. S.—I also want facts about the power when starting the motor.

(*Mr. George Westinghouse, Jr., to Prof. Forbes.*)

Pittsburgh, Pa., October 30, 1891.

Prof. George Forbes, 34 Great George Street,
London, S. W., England.

My Dear Sir: I desire to apologize for not having written earlier in answer to yours of September 19th. I have given the matter very full and careful attention, denounced the alternating current, for none of them had had the experience which I possessed of the latest developments. . . .

I heard no more from the promoters of this enterprise for over a year. It took them all this time to realize that the Commission had made a mistake. Lord Kelvin was the most violent opponent of the alternating current; and for long afterwards (although he is my most esteemed and oldest scientific friend), even when I was appointed as the consulting engineer, he continued to write and cable to the company, though his opinion on this point was not asked for, telling them that they were making a "fatal mistake" if they followed my advice. . . . But in this and other points where my plans were at variance with the opinions of others, I was most loyally supported by the directors, and through this support alone they and I have been enabled to put the works into their present satisfactory condition. . . .

Early in the year 1892 it became evident to the acting committee that the views of engineers had been undergoing a change, and that the use of alternating currents for Niagara was a necessity, thus indorsing the prophecy I had made long before. They then asked me to act as their electrical consulting engineer, and during that year and the next and the next I was constantly in the States. The only real rest I ever got was in my voyages across the Atlantic. I soon came to feel at home on all the large liners. . . . The misfortune is that at most seasons the only class to travel much are the American bagmen or drummers, and they are not a favorable class to judge Americans by.

Sometimes I lived in New York where the offices were; sometimes at Niagara to be near the works. I did not care to go much into society, but I made some very firm friends, specially the Hewitts, and our amiable Consul-General Sir William Booker and his charming American wife. My greatest friend of former days had been S. L. M. Barlow, a well-known and remarkable man. Roscoe Conkling and I used to dine with him every Sunday. These two lawyers, both able men, on opposite sides in politics and also in the great Stewart will case, amused and instructed me much by the exposition of their views on men and things. Both were dead now and I had two friends the less to help me pass these three years. Part of the time I lived in Tuxedo, an hour from New York, where you could have fishing, shooting, boating, bathing and golf; and I shall never forget the cordial welcome I there received from the Potters Bruzes, Lorillards, Delafields, Fishes, Kents, Rushmores, Prestons, Van Courtlandts, Van Nests and from Allen Lathrop and many others. The lovely scenery and genial society of this place helped me greatly to retain health during a period of anxious and arduous work.

This is all of intense interest, and the Professor should not have cut it off so short. We crave for more.

In 1892 when I came to examine the plans put in by various manufacturers, I found that some of the crudest work conceivable had been submitted by the Americans. The Europeans sent some excellent designs, especially the Oerlikon Fabrik, near Zurich. But these makers were handicapped by the duty imposed on machinery imported into America. There was, however, one fatal defect in all the plans then or subsequently submitted by the manufacturers. . . . The American manufacturers were entreated to alter their dynamo designs to meet this difficulty. They tried, but they were unable to do so. . . . Meanwhile I had been constantly working at various new designs, and at this stage I saw that, for the credit of the company, it was imperative that I should, if possible, get out a design on new lines which should have the required fly-wheel effect without too great a weight. . . . It occurred to me that if I could make the external part revolve I should get a maximum of fly-wheel effect with a minimum of weight. . . . I proceeded to get out rough designs and found, with the utmost satisfaction, that I could meet all the requirements of the turbine-makers. I also found that this design gave far greater mechanical strength to the revolving part of the dynamo—an important matter, with this forty tons revolving more than four times a second. Furthermore, the magnetic attractions which in all the other designs increase the dangers from centrifugal force, in my design actually diminish them. It soon became evident that this happy idea of revolving the external parts completely extricated the company from the very awkward dilemma in which they had been placed. I then proceeded with a large staff of draughtsmen to get out the working drawings, and I secured an American patent as a protection to myself and my company. It was a matter of considerable satisfaction to all concerned that I had thus so simply got over the serious difficulty which at one time threatened us with starting afresh on all the machinery, turbines and all. . . .

The designing of a suitable dynamo was, however, only one of a number of difficulties that had to be overcome. Some of these were of an engineering character, but others savored of "politics" in the sense in which that word is used in the States. There *politics* means intriguing, underhand dealing and jobbery, and is always used in conversation to express that meaning. *Until I went to America the manufacturers of electrical machinery never had a consulting engineer to reckon with*, but dealt directly with the financiers who knew nothing about cost or efficiency of machinery. When they knew that I was to advise the Niagara Company, they tried by every means in their power to revert to the old plan. Every game of bluff, bounce and threats was used but without the least effect. One of our engineers in another department to mine, who knew nothing of electricity, was completely taken in by one of these firms. This and other intrigues hindered me a good deal in carrying out my plans. Then, again, I had at times great difficulty in keeping the president and vice-presidents in hand. One of the latter, after he had learnt a little about ohms and volts, believed himself capable of instructing me as to which tenders I ought to recommend for acceptance, and did his best to try to influence my judgment. Most of them began to think they knew something about the subject, and that they were quite capable of settling what tests the machines should be put to. All this was generally amusing enough, but became almost tragic at times when I found them endangering the whole work. On such occasions I would write to my millionaires and tell them that if they did not do what I told them they would be personally answerable to the directors and shareholders for any disaster that might occur. This always had the desired effect and my point was carried. I fear that at times they wished me at Jericho, but after any one of these tiffs was over I think they were glad that I had taken that line.

I have said that there were many new electrical problems to attack. One of these was a new departure on my part, which involved a very heavy piece of calculating and designing before I could be perfectly certain that my conclusions were correct. It occurred to me that with the large machinery we were using (the dynamos which I designed* were three or four times as powerful as any that had then been made) it would be best to make the alternating current reverse its direction as slowly as was consistent with making a good dynamo. This would not do so well for *lighting*, but for a *power* station like ours the advantages were powerful and numerous.

Then again, some of the manufacturers, threatened us with patent-litigation if we used certain types of machinery, so I had to get out designs of *another kind of motor* to drive the mills, so that in any eventuality we should be prepared and able to go on in spite of these threats. Then our first customers wanted continuous current, and I *had to select* a method of making the conversion. . . . In the afternoons I generally took a drive in a buggy on the Canadian side, where the roads were passable, and sometimes I rode. I had a *nigger* servant to look after the house, who differed from all his race. . . .

In this difference the nigger was similar to Prof. Forbes

An Englishman in America should always try to retain his Englishness—otherwise in a year or two he will be reduced to the level of an average American. Where all men think themselves equal, individuality is at a premium. An American once tried to find fault with me for pitching into my servant, because, forsooth, all men were equal. I never saw the man before, and would never see him again. So I told him that if he wished to be placed on a par with my valet I would willingly acquiesce, but he must not attempt to define my place on so short an acquaintance. . . .

It is unfortunate that Prof. Forbes never had any "Englishness" to retain. If Englishness means anything, it means refinement and good breeding. The process by which Forbes would reach the level of "the average American" is outlined in the Darwinian theory. It is not a process of reduction.

The dynamos were at last made and tested, after most annoying delays and disingenuousness on the part of the manufacturer. The makers of the transformers and machinery for getting a continuous current, on the other hand, were prompt and obliging, and the tests came out well. Then I got bids for the appliances for transmitting power to Buffalo. All the conclusions I had arrived at from my own designs were now confirmed. Their cost per horse power, even with my low frequency,* was a fifth part of those that had been used for lighting, and the efficiency guaranteed was as I had stated. I decided on all this transmission plant, and it is not now put in only because the Buffalo people want to get the power for next to nothing. There is too much "politics" in this business at Buffalo. Another triumph I have had is, that engineers all over the world have learned to appreciate *my low frequency of alternations*, while we ourselves have found new merits in it at every step. . . .

When this was all completed and the first plant in place, the period of construction and design gave way to a period of dividend-earning, and my continuing to take charge would have swallowed up too much of the annual income, so I concluded my engagement with the company.

Prof. Forbes's salary was $400 a month, including expenses, about one-half of what a good American bagman receives.

This letter from which I have made this extract attributes the splendid results which we attained mainly to engineering skill. I am inclined to believe that they were fully as much the result of an exercise of tact, judgment and forbearance, combined with firmness—qualities which I do not hesitate to say that both the officers of the company and myself recognized in each other, and without which we should have found it difficult to obtain satisfaction from the manufacturers. . . .

Of course he does not hesitate—not Forbes. Why should any man who has so plainly shown his tact, judgment and forbearance, combined with firmness, hesitate.

. . . Owing to the support I obtained from the acting directors, the whole work for which I was responsible has been put in place and set agoing without a single hitch. This is not usual in a novel work of so great magnitude. I

---

and I have come to the conclusion that our company cannot afford at this time to make public the information it has acquired in its work on the Tesla motor. The Tesla patents and discoveries include many very important matters, and his patents particularly cover the multiphase forms of motors and generators now attracting so much attention.

You must have become aware that patent rights are no longer respected in this country; that whatever is brought out and fully explained is immediately availed of by unscrupulous competitors; and we now feel it is a matter of great importance to maintain for the present, and until we are well established, what are properly secrets of the trade. To no one would I sooner give the information asked for than to yourself, and I hope the day is not far distant when we will be able, with safety to ourselves, to meet your wishes in this respect.

Trusting that you will appreciate the reason given for not promptly complying with your request,

I am, very truly yours,
Geo. Westinghouse, Jr.

(Mr. George Westinghouse, Jr., to the London Times, Aug. 29, 1895.)

. . . Business relations were established between Prof. Forbes and this company in 1888 by the purchase of his patent for a meter operated by hot air currents, and he was afterwards employed by us as an expert in a patent case and in making tests on transformers. He thus had every opportunity to become acquainted with our practice and ideas in connection with the use of alternating currents for light and power purposes, and also had an opportunity to see considerable of the early work on the Tesla motors. That such opportunities were valuable to him is shown by the fact that the first plan submitted by him for the transmission of power from Niagara Falls was almost identically on the lines that we had laid out for such work and freely discussed with him.

In consequence of Prof. Forbes having written the foregoing letter without stating that he was a competitor for the honor that would accrue to the successful designer of a complete plan, our company, for that and other good business reasons, refused to permit Prof. Forbes under any circumstances to visit its works or to have anything to do with the designing, constructing, or testing of the generators, and we are not aware that he has ever seen the apparatus which is now in operation at Niagara and for which he seeks to claim the entire credit.

. . . In our [World's Fair] exhibit generators, motors, and rotary transformers were operated at 3,600 alternations per minute, being practically identical with the frequency actually adopted at the Falls, and very different from Prof. Forbes's recommendation of about 1,000 alternations per minute.

Prof. Forbes made a suggestion for a device for commutating currents, in place of a rotary transformer, which device was built, and upon test the fact was disclosed that it was not anything like as good as the rotary transformer which we had designed and which form was afterwards adopted by a rival company, as Mr. Forbes says, on his recommendation.

Westinghouse Electric & Manufacturing Co.,
(Geo. Westinghouse, Jr., President).

** (Mr. George Westinghouse, Jr., to the London Times, Aug. 29, 1895.)*

After a lapse of two years, and prior to the design of the dynamo referred to by Prof. Forbes, this company submitted to the Cataract Construction Company plans and specifications for a dynamo, with a system of distribution for the operation of arc lights, incandescent lights, street cars, and for electrolytic purposes, including rotary transformers. Full information and particulars were communicated to the engineers and officers of the Cataract Construction Company. Owing to the purloining of our plans by a rival company and for other reasons all tenders for generators were rejected by the Cataract Construction Company, who afterwards, in September, 1893, submitted to us plans for a 5,000 H. P. generator, saying that such plans had been prepared by their engineers, and asking us to make a tender for its construction and erection. A careful consideration of the plans submitted disclosed the fact that if constructed according to such plans the generator would be a failure, and this company thereupon refused to tender on the drawings and specifications presented. We, however, offered to accept the general form of generator, and to re-design it so that it would be a perfect machine mechanically and electrically, and to submit new plans and specifications upon which the company would tender. This was agreed to by the Cataract Construction Company, and the generators now in use at Niagara Falls were built by us according to plans and specifications prepared by our own engineers. There is about the same difference between the machine designed by Prof. Forbes and that designed by us as there is between the picture of a man and the man himself—the appearance externally being very similar, but internally there is no resemblance whatever.

---

*See letter of George Westinghouse, Jr., to "London Times."

feel confidence in asserting that so long as the instructions I insisted upon are acted on, there will be no trouble with the electrical machinery.

I penned a letter to the *Times*, which was published at the end of the year 1894, and from which I may make an extract:

"I am perched on the top of a small Eiffel tower, lately erected. . . ."

Nonsense, Forbes. You are farther from the earth than the top of the Eiffel tower. You are flying *through* limitless space, and if you get too near the sun, as did Icarus of old, and melt your wings, you will still fall to earth unbruised—if you can light on your cheek.

. . . The directors have no present desire to send the current to great distances. It will pay better to create a smokeless manufacturing town in the neighborhood. If required, the power could be sent much more than a hundred miles, and still be more economical than steam, even though coal is cheap there. In countries where power is much wanted, but very costly, the electrical transmission will be successful at distances of many hundreds of miles. Such cases occur in many places where there are valuable mines but no fuel.

In conclusion, I may say that the work done at Niagara is the forerunner of much more, and already I have in hand the preparation of plans of schemes nearly as important.

I also wish to bear tribute to the kindly friendship which I almost universally experienced at the hands of American engineers. Hardly a single case occurred where any jealousy was shown at an Englishman (or rather Scotchman) being selected to carry out the work.

George Forbes.

American engineers jealous of Forbes! Perish the thought!

Electricity has a warm love for Englishmen and for England, and this feeling is the rule rather than the exception in America. But we rejoice that Forbes belongs to England and not to us.

HYSTERESIS COMPENSATOR.

The following specification forms part of letters patent No. 545,042, dated August 27, 1895, granted to Bruno Abdank-Abakanowicz, of St. Maur, France, by the United States Patent Office; application filed March 17, 1893:

To all whom it may concern:

Be it known that I, Bruno Abdank-Abakanowicz, electrical engineer, Parc St. Maur, near Paris, France, have invented certain new and useful Improvements in Methods of Compensating for Hysteresis (for which I have obtained letters patent of the Republic of France, No. 228,400, dated March 6, 1893, and of the Empire of Germany No. 78,937, dated March 22, 1893,) of which the following is a specification.

It is well known that in all electromagnetic apparatus in which iron is used as an electromagnet or solenoid acting on a core plate, or armature of iron, or even upon a coil or another electromagnet, it is impossible to realize or obtain effects that are proportional to the current or to any exact function of the current; or the above may be stated thus: first, the error of magnetization of iron is not a straight line, because the magnetization produced is never proportional to the current producing it; second, the function of magnetization is double—that is to say, the quantity of magnetism actually produced does not depend exactly on the quantity of current producing it, but also on the value of the current by which the magnetic system had been previously energized. This difficulty presents itself especially in that class of apparatus which depends upon certain fluxes of magnetism, as in electrical-measuring apparatus, and in indicating apparatus or that class of apparatus in which a mechanical action is brought into play, due to an electric current having attained a certain predetermined value. It is a well-known fact that when, in the last-mentioned class of apparatus, we employ masses of iron or electromagnets, it is impossible to make them work in a predetermined and satisfactory manner, and that the cause is due to residual magnetism, which is but a particular case of the general effect known as 'magnetic hysteresis."

My invention consists, therefore, in the combination with a magnetic circuit of one or more masses of iron, steel, or other magnetic matter, constituting what I call a "secondary differential magnetic circuit or circuits." This secondary circuit may be magnetized by the same current as that employed for the principal magnetic circuit, or it may be magnetized by a certain fraction of this current; but the actions of the lines of force of the secondary circuit are in an opposite sense to those of the principal circuit. By choosing suitably the dimensions of the secondary magnetic circuit with reference to its own physical properties, those of the principal circuit, the ratio of the air space to the rest of the circuit, and the magnetizing force employed, a differential value of the magnetic flux or differential value of the mechanical effects produced by the system on a core, coil, or armature, may be obtained for all currents within the working range of the apparatus, which shall be proportional to those currents. This may be briefly stated thus: The effect of the residual magnetism of the first circuit is neutralized by the residual magnetism of the second.

It is to be understood that the two magnetic circuits are not necessarily independent of each other, and that the conductor turns of one may be employed to energize the other. The practical realization of this combination does not present any difficulty from the fact that the magnetization curves of iron, steel, etc., are very similar in form, and that by a judicious choice of material, such as wrought or cast iron, steel, or other magnetic matter, combined with an air-space of suitable dimensions, it is always possible to obtain curves of the same form in such a way that the difference is represented very nearly by a straight line, which is a function of the ampere-turns. It is also possible, as is required in some particular cases, to have a curve of other shape than a straight line.

For the sake of greater clearness I will illustrate the application of my invention to several simple cases, it being, however, clearly understood that I do not limit myself to the particular cases cited, but aim to embrace the use of a differential magnetic system of the type described for the compensation of hysteresis.

In the accompanying drawings, which show mechanism embodying my invention, Fig. 1 is a sectional diagram of a wattmeter, showing its principles. Fig. 2 is a section of an ordinary solenoid or electromagnet. Fig. 3 is a section of a differential solenoid embracing my invention. Fig. 4 is a sectional side elevation of a similar arrangement in a different form, and Fig. 5 is a plan of the parts shown in Fig. 4.

Suppose, for example, that it is required to construct a wattmeter for the measurement of continuous currents of the type represented by the diagram, Fig. 1. The potential is measured by the movable coil and the current is made to traverse the coils H of the principal electromagnet, and the coils *h* of the secondary or compensating electromagnet. The core N^1, which produces the principal flux, should be made of metal having the smallest amount of hysteresis possible, of soft iron, for instance, while N^2, which produces the flux for compensation, should be made of cast iron or steel, or some metal having a high coefficient of hysteresis.

The double arrows in the diagram represent the directions of the magnetic fluxes and the single arrows of those of the current. By varying the sections of the two cores N^1 N^2, the ampere-turns applied to these cores and the air-spaces of the magnetic circuits, it is possible to make a combination such that the residual magnetism is either entirely or only in part compensated and that the resultant magnetic flux will be always proportional to the current, in which case the resultant torque of the armature will be proportional to the watts. I may apply practically the same method to the case of a solenoid acting on a core of soft iron, which core it is desired shall be drawn in by the action of the solenoid to a certain predetermined point when the current shall have attained a certain predetermined value.

In many forms of apparatus a solenoid A, Fig. 2, through the coils of which passes a current acts on an iron core N, suspended by a spring R or held in equilibrium by a counterpoise. For a certain value of current the core should arrive at a certain position —for instance, to just touch the stop *a*. This condition can never be quite realized by the employment of a form of apparatus similar to that shown in Fig. 2, for the reasons previously mentioned, due to hysteresis, and to avoid this difficulty, which prevents the construction of apparatus of great precision, I may employ my method as follows: I employ two cores N^1 N^2, Fig. 3 connected together mechanically. N^1 is the principal core, and is composed of material possessing small hysteresis. N^2 is of smaller section than N^1, but is made of a material having a high coefficient of hysteresis. To the first core I apply what I call the "principal solenoid" A^1, which tends to attract the core in a certain sense, and to the second core I apply a solenoid A^2, called the "compensating solenoid," which attracts its core in an opposite sense. The resultant attraction on the two cores will therefore be the difference of the two attractions, and from what has been said above it is easy to understand that the effects of hysteresis can be compensated for, especially with regard to the position of contact of the core with the stop when the two solenoids are traversed by the same current or by currents which bear always a certain proportion to each other.

The above-described combination, of which the mechanical disposition may be varied in an almost infinite number of ways, has for its object to render the resultant attraction independent of the effects of hysteresis in the core. The result aimed at is obtained by a suitable choice of the nature of the cores N^1 N^2, of the ratio of the turns on the solenoid A^1 A^2, (or of the ratio of the ampere turns if the two solenoids be in multiple,) and of the relative position of the solenoids with respect to the cores.

To demonstrate further the generality of the application of my method of compensation, I may give one more example. In a great many forms of apparatus there is an electromagnet which acts on a plate of soft iron, forming an armature, by the mechanical movement of which certain desired results are to be achieved—for instance, to establish an electric contact when the armature is attracted by the electromagnet. In this form of apparatus again precision is effected by eliminating hysteresis. The position of the armature or plate for a certain current is not always the same if the current has once surpassed a certain limiting value. The deviation is still greater if the apparatus be employed with alternating currents.

My method of compensation is particularly applicable to the case just mentioned, and constitutes an important improvement when applied to this class of apparatus. Fig. 4 represents the application to a particular case of this nature. The principal electromagnet E^1 acts on the soft iron armature N^1 in opposition to the spring R and against the action of the differential electromagnet E^2 and the armature N^2, which have a high coefficient of hysteresis. The two electromagnets are supposed to be excited by the same current, which presents the simplest case. By choosing suitably the elements of the magnetic circuits of the two electromagnets it is easy to arrive at such a combination as will insure that the contact between *c c′* will always just take place when the current has attained a certain predetermined value, whatever may have been the previous values of the current. The practical rule to follow in this case is as follows: The attraction due to the residual magnetism of the electromagnet E^2 and of the armature N^2 ought to be equal to the attraction produced by the residual magnetism of the electromagnet E^1 and of the armature N^1 for the position of contact.

FIG. 1.

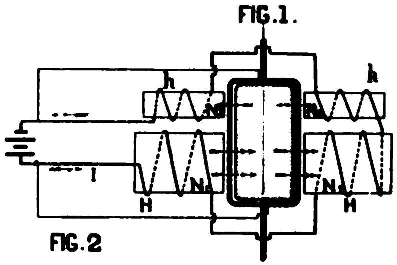

FIG. 2

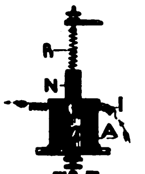

FIG. 4

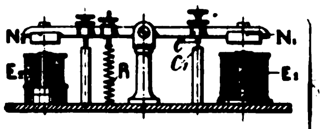

FIG. 3.

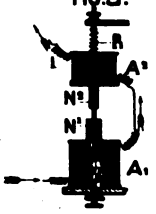

FIG. 5.

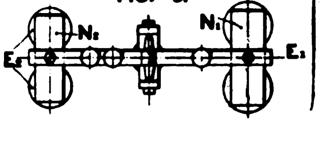

It is possible to show an almost infinite number of examples of the application of my method, but I consider that those already cited are sufficient to illustrate its operation.

Having thus described my invention, what I claim as new, and desire to secure by letters patent, is—

1. The method of correcting or neutralizing the effect of hysteresis in electro-magnetic apparatus, which consists in employing in such apparatus a main and an auxiliary magnetic circuit and neutralizing the effect of the residual magnetism of the first circuit by that of the second.

2. In combination, an electric circuit, and an electro-magnetic apparatus therein having a plurality of cores acting in opposition to each other, such cores having different magnetic material and so arranged that the resultant or differential effect of the cores actuates the apparatus and corrects or compensates for hysteresis, substantially as described.

3. In combination, an electric circuit, and an electro-magnetic apparatus therein having a plurality of cores acting in opposition to each other and of different magnetic retentiveness; the magnetic circuits of the apparatus being so disposed that the differential

action of the cores furnishes the effective actuating force of the electro-magnetic apparatus, and neutralizes hysteresis effects, substantially as described.

4. In combination, in an electro-magnetic apparatus, of a plurality of opposing cores having relatively different hysteresis coefficients and actuating the moving part or parts of the apparatus by the difference between their opposed effects and means for energizing the cores.

5. The combination, in an electro-magnetic apparatus, of electro-magnets having respectively cores of soft iron and of hard iron or steel, the cores being arranged to act upon a moving part in opposition to each other, and means for energizing the cores.

In testimony whereof I have hereunto affixed my signature, this 23d day of February, 1893, in presence of two witnesses.

BRUNO ABDANK-ABAKANOWICZ.

Witnesses: C. W. G. Little, A. M. Tanner.

THE PROPOSED MAGNETIC UNITS.*—III.

To the Editor of THE ELECTRICIAN.

SIR: It is after hesitation, and with some reluctance that I comply with your request to take part in the discussion of this question. The fact is I do not see that the proposed new names and new units are needed. When so clever a man as Prof. Lodge takes all these pains, I should like to believe that his proposals are meeting a felt want. But by whom is the want felt? I hold strongly that in this matter necessity should be the mother of invention. Dr. Lodge offers us sundry bantlings for adoption, but where is the maternal parent? New names and new units will be worse than useless unless they quickly become familiar. The B. A. Committee may make them legal tender among electricians, but will they come to be current coin? Will the success that attended the invention of ohms, volts and amperes be repeated, even in minor degree? Only if the new names allow us to conceive magnetic quantities more easily or to specify them more tersely than we can already do. We are accustomed to say that the permeability of air is 1. Will the advantage of calling it the "inductivity" instead, and of saying that it is one millihenry per kilometer, be immediately obvious to practical men?

In some cases it is proposed simply to give a name to the C. G. S. unit, and in other cases to use a multiple of the C. G. S. unit and give that a name. Thus Mr. Evershed would have us call the C. G. S. unit of magnetic induction a "thom," while Dr. Lodge would take 10^8 of the same unit and call it a "weber." Why do either? So long as we stick faithfully to C. G. S. a number is enough. To say that the total induction through an armature is 25 millions is at least as convenient and precise as to say that it is 25 million "thoms" or 0.25 "weber." Dr. Lodge has chosen the magnitude of the "weber" so that an E. M. F. of one volt shall be excited in a conducting circuit through which the total induction changes at the rate of one "weber" per second. But this endeavor to connect the new unit with the volt, the ampere and the ohm results in making it inconveniently large. Better, I think, use C. G. S. pure and simple in dealing with the magnetic quantities, and introduce the needful power of 10 when we want to reckon volts.

Again, we are asked to accept a new name for the line-integral of magnetic force, which most of us (following Mr. Bosanquet) call the magnetomotive force. This quantity is of first-rate importance in relation to the magnetic circuit as a whole. But I doubt if the occasion ever arises in practice to reckon magnetomotive force except for the whole circuit. And so long as we are dealing with the magnetic circuit as a whole it is not likely that any new name will be more serviceable than the familiar and eminently practical "ampere turns." When we want, for purposes of reckoning, to express the magnetomotive force in C. G. S. units, it is easy to multiply by $\frac{4\pi}{10}$; but ampere turns is too expressive and explicit a phrase to require addition or change.

As to the magnetic force at any point (H), no new name is wanted, and the C. G. S. unit is all that could be wished in respect of magnitude.

I understand that it is proposed to use one and the same unit for the permeance of a magnetic circuit and for the self-induction of a coil or the mutual induction of two coils. These are quantities of the same dimension, and as Prof. Lodge points out, the self-induction of a coil of n turns is $4\pi n^2$, the permeance of the magnetic circuit through its coil. Mr. Baily's objection that the self-induction of a coil would be liable to confusion with the permeance of its core has much force. As to permeance, which is total induction divided by magnetomotive force, no special unit name seems necessary. Whether a unit name for self-induction and mutual induction is practically important I have no opinion. The invention and partial use of "secohm" on this side of the Atlantic and "henry" on the other suggest that it is. But in any case it would be unfortunate and confusing to give the "henry" a value different from that which has already been assigned to it. Will American electricians consent to make their old name have a new meaning? Moreover, though this is of less consequence, the unit now proposed is, like the "weber," inconveniently big. These are large prices to pay for the kind of consistency that is aimed at in Prof. Lodge's proposals.

One or two points may be noticed that have come up incidentally in this correspondence. Prof. S. P. Thompson speaks of the quantity which we write B as "unfortunately sometimes miscalled the induction, as though induction were not the operation of inducing." I have rarely heard it called anything else, and am content to follow Maxwell, who probably believed that induction, like deduction, might properly name the result of a process as well as the process itself.

To define μ as $\frac{dB}{dH}$ would, in regard to iron, make μ useless. It should be remembered that, owing to the complications of hysteresis, the term permeability as applied to iron has a special meaning. It is used to name the ratio of B to H, which H is either (*a*) applied without previous magnetization, or (*b*) applied after previous magnetization by an equal and opposite magnetic force. These two definitions do not give strictly the same result; but the values are so nearly alike that the difference is, in practice, unimportant.

As to Mr. Heaviside's invitation to formulate a theory of the process of magnetic induction in iron, I fear that the relation of B to H is far too complex—as depending on previous values of B—to admit of mathematical statement. That at least is the conclusion to which a study of the model with small magnets seemed to point, where the process of magnetization was seen to occur through the breaking up and rearrangement of inter-molecular ties under the influence of the applied field. Yours, &c.,

J. A. EWING.

Festiniog, North Wales, Aug. 26, 1895.

To the Editor of THE ELECTRICIAN.

SIR: Referring to the correspondence on the subject of magnetic units now going on in your columns, I am sorry to say that Prof. Thompson could not have named in this connection a less sympathetic individual than myself, as the alleged necessity for new units does not in the least appeal to me.

It is unnecessary to seek a new name for "one line of force" or for "1,000 lines of force," or for "a million lines of force." As well might we coin a new term for "one revolution," follow that up with another for "100 revolutions," and still a third for "1,000 revolutions"—a *kilorevolution* to wit. It is as easy to say that the total flux is "5,000 lines" as to say that it is 5 *kilolines;* and the "thom" of my friends at Woodfield Works I have never been able to understand. Substituting *thom* for *line*—I put it shortly, without writing *of force* after it—I have always regarded as the most awful example of unit mania extant.

As regards *the number of lines per square centimeter* or *induction*, denoted by B the world over, I do not see that we require special names for particular values of it. "Lines per square centimeter" = so many, or "the induction" = such a figure, or B = so much, seems to meet all cases. There are some I know who would like to have a name invented for 1,000 lines per square centimeter, but I am not amongst them. *Engineers* have gone on very well without such variety of terms. *They* do not require a distinct name for a speed of 30 miles an hour and another for 60, or a special term for 100 lb. pressure per square inch and another for 120 lb. Proposals of this kind made by anyone would very properly be regarded as ridiculous, and having been brought up in a practical school, I am consequently inclined to look down upon the senseless multiplicity of terms some electricians would have us adopt.

There remains *magnetizing force* to be dealt with, and here I am still at a loss as to what is requiring new definition. Magnetizing force is expressed in two different ways, either as the *line integral* or *ampere-turns* accordingly as the constructive engineer regards one or other as the more convenient. What he has to determine is the magnetizing force required for a given circuit, and this he finds from his iron data in the usual manner; but how it will help him to give a name to some particular value of magnetizing force, whether expressed as the "line-integral" or "ampere-turns," and call it *unit magnetizing force*, I fail to see. Altering the unit of current is not to be thought of seriously for a moment. Magnetic quantities are only dealt with professionally, if I might so put it, while amperes, volts, watts and horse-power are dealt with commercially by everyone having the slightest connection with electrical matters. These quantities have become stereotyped as part and parcel of an industrial system, and even if a change were desirable, which it is not, they could not be altered with any greater facility than could the horse-power.

The advantage of having a universally received meaning for the terms in Prof. Thompson's paragraphs 5 and 6 seems to be more apparent than real. Whenever the relation between magnetic force and flux is given by any writer he is careful to state which way the magnetizing force is computed, so I do not think any confusion has arisen or is likely to arise under this head.

Of course I am writing solely from the constructive engineer's point of view, and it may be here observed that practicians who write on questions of construction are likely to adopt the language they have found most useful, whatever new names may be invented by the physicists. Probably Mr. Evershed would not give up his "thoms," nor Mr. Kapp his "English lines," nor the writer his "ampere-turns" without a pang. Again, it is unlikely that anything the practician urges will be considered by the high-and-dry theorist, for the latter seldom understands the mode of thought of the former, and when he does comprehend, he fails to appreciate it.

Probably all engineers do not share my views, but the engineers—I bar *electricians*—who are represented as thirsting for fresh units I have never met. We have done wonderfully well for some time with the existing terminology, and the "swallowing of camels," to use Mr. Heaviside's expression, has not impaired our faculties. By all means let the "scienticulists" invent units and names for units, as many as they please, but they should not delude themselves into the idea that the practician is benefited thereby; it makes not the slightest difference to him.

I understand Mr. Heaviside is the ringleader of the unit movement, and for that gentleman's work I have the greatest respect. But as the heavens are higher than the earth, so are Mr. Heaviside's thoughts loftier than those of a mere practician, and his conclusions correspondingly obscure to the average intelligence. Nevertheless in his own domain he has done work which will endure. And conscious that the practician can never degrade it by application to dynamo design or other things useful, he ought to be both proud and happy. Yours, etc.,

W. B. ESSON.

London, August 27, 1895.

To the Editor of THE ELECTRICIAN.

SIR: I am ashamed to say that for many years I designed dynamos without using the orthodox H and B, until the sarcasm of a third-year student, who wasted hours in drawing the most beautiful German capitals, at last induced me to multiply my square inches by 6.45 and my minutes by 60. It looks better, but it is more trouble.

As to the new units, they should certainly have the same relation to each other as the volt, ampere, and ohm; this will remove a great difficulty from the path of many students who have to teach themselves, and who always seem to find it so hard to get beyond Ohm's law. I do not see that any other units are wanted.

With regard to the 4π question I do not think that it is generally known that 2 H = the ampere-turns per inch long within 2 per cent. This is immensely useful, as all lengths can be taken in inches, so that I should be very sorry to see 4π disappear.

I hope that "thom" will not be adopted among the new names; it is nearly as offensive as "practicians." Yours, etc.,

HENRY W. RAVENSHAW.

110 Cannon street, E.C., August 26, 1895.

To the Editor of THE ELECTRICIAN.

SIR: So long as the unit of length of the mechanical engineer is not a centimeter, it is unreasonable for us to reckon lengths and areas in machine design by that unit. Conversions of the dimensions in a design from centimeters into inches are a serious nuisance which an engineer cannot afford to submit to merely in order to support a theoretical system of measurements. Hence I consider the units for magnetic quantities per centimeter (H), or per square centimeter (B), and consequently the names for such units, as of little interest (What about a name for the unit of current density in amperes per square centimeter?) until the mechanical engineer takes to the centimeter, or let me say, until he decides whether he will have that unit of lengths or not. For, suppose the electrical and mechanical engineers, whilst waiting for the millennium of metrical measurements, were to agree upon, say, a decimal foot (10 English inches) and 1 lb. avoirdupois as fundamental units, then they might any day, *without changing tools and gauges*, have the immense advantages accruing from the use of a rational system—advantages which otherwise seem to be still in the blue. It must be remembered that the C.G.S., besides having unsuitable fundamental units, is not a rational system.

---

* From the *Electrician* (London).

I have a number of years ago constructed my B-H curves and tables with 1 kilo C.G.S. per square inch as unit B", and 1 ampere-turn per inch as unit H". With these units wrought iron and dynamo steel goes in the habitual ranges from 30 to 120 B" under 3 to 570 H", and the net magnetic pole in a dynamo, when it is running light, is (1 kilo C.G.S. being unit magnetic pole) $m = \frac{6 \times 10^8 E}{N b}$ (m = magnet pole, E = volts, N = revolutions per minute, b = number of bars effective), which are convenient values.

My H" unit, 1 ampere-turn per inch, being $\frac{0.4\pi}{2.54}$, and my B" unit $\frac{1,000}{2.54^2}$ times greater than the respective C.G.S. units, my ratio $\frac{B''}{H''}$, multiplied by $\frac{1,000}{0.4\pi 2.54}$, or 313.3, brings μ based upon unity for air; my quantities are those given in practice. If we use the C.G.S. system, the practical data are ampere-turns per centimeter and pole (or lines) per square centimeter and μ is obtained by multiplying their ratio by $\frac{1}{0.4\pi}$, or 0.7958, a figure which is no more convenient than my 313.3. Yours, etc., F. V. Andersen.

14 Westdown-road, Catford Bridge, London, S.E.,
August 27, 1895.

IS A FREIGHT OR MAIL SERVICE PROFITABLE OR UNPROFITABLE ON STREET RAILWAYS.*

BY BENJ. F. NORTON.

Discussion.

Mr. Meiklehan—I would ask the gentleman how he arranges to collect his freight, without interfering with his passenger traffic?

Mr. Norton—If you were running cars on four minute headway probably there would be some trouble, but where we run once an hour, between Newburg and Walden, we have ample time, particularly as the line runs through the main street, and the stores are all located on that street. It never interferes with the passenger service. We have a general freight house in Walden, with a siding, where freight is delivered during the day. We have our freight trains arranged on a regular schedule and some of it is collected along the line of the road. Of course, a great deal of it is delivered at the freight house.

Mr. Meiklehan—You say, if it does pay, it pays. Do you not think that the line is drawn at the point of the ability of the road to deliver and receive. In 1888 a road in Norristown undertook to do that work and made a great deal of money out of the freight service, but the trouble came in at the point of delivery. We were expected to take a package to anybody along the line, and its delivery might require skids to get it to the door, and the delay was found to be very annoying. If we could have certain points at which to take up and deliver freight, we could put in sidings, and the matter would be simplified.

Mr. Norton—Most of our freight is sent through from one point to the other. We have comparatively little intermediate freight in the twelve miles between the two points. Most of the firms who send their freight are within easy reach of the freight houses, so that we have not had any inconvenience in receiving or delivering freight.

Mr. Meiklehan—That is the question—whether you can get such freight in sufficient quantities.

Mr. Cole—Have you made any arrangements for carrying letter-carriers at a cheap rate?

Mr. Norton—We have not taken the matter up argely with the post office. There happens to be one instance that I think of where we do transport the mail carrier, on a route which is perhaps a little onger than the average—out to West Newburg. We et him ride both ways free, two round trips each lay, to collect and deliver mail.

Mr. Cole—Some years ago I was connected with he Utica Belt Line Road, and we made arrangements not only to carry the mail but received a stipulated um for transporting the mail carriers; it cost about hree cents a man.

Mr. Norton—We had that arrangement in Brookyn; it is in vogue now. The fare was three cents. understand it is four cents now.

Mr. Cole—At Utica we carried a sign on all the ars, "U. S. Mail," whether we had mail on the car r not.

Mr. Norton—You were authorized to carry the mail on your system?

Mr. Cole—Yes.

Mr. Norton—There is no question about the right to carry the signs. We had in Brooklyn two cars arranged like the regular railway mail post office, on the long line to Coney Island. We had a side track into the General Post Office in Brooklyn. The mail was put into the cars, and the mail clerks went along and distributed it, and they picked it up and sorted it in the car and delivered it at various stations. The West End division of the Atlantic Avenue system was formerly a steam road, and they had a regular Government contract to carry the mail. When we changed it over to electricity we carried on the contract. I do not think there is any other road, unless it is in St. Louis, where the service is performed in that way, as a regular railway mail post office. Many of the cars in most cities are allowed to carry signs simply to pick up mail bags and move them from point to point, but in Brooklyn the mail is regularly sorted in cars on the road.

Mr. Cole—I think it is so in Boston.

Mr. Ostrom—Also in Philadelphia.

Mr. McNamara—We have been operating for over a year a freight line between Albany and Troy—an interurban freight line. We have a freight house in Albany and one in Troy; we do not aim to take up packages on the way; it is a through freight line. We have been operating it for a year and are going to continue.

Mr. Norton—Have you any special provision in your franchise which authorizes you to carry freight?

Mr. McNamara—We are operating this freight line on a leased line which was chartered to do it, otherwise we could not do it.

---

* Paper read before the New York State Railway Association, Albany, September 17, 1895.

PERSONAL.

Mr. Frank B. Rae, who has lately opened offices in the Dearborn Building, Chicago, has been a New York visitor this week.

Mr. Dan C. Spruance, of Philadelphia, called on a few of his New York friends last week.

Mr. H. J. Medberry, of Mechanicsville, was among our out-of-town callers last week. Mr. Medberry is considering the question of entering the field as a manufacturer of dynamos.

Mr. W. H. Knight retired from the General Electric staff October 1 and will devote himself to consulting work in connection with rapid transit development.

Mr. W. D. McQueston returned last week from a two months' European trip.

Mr. Samuel Insull, of the Chicago Edison Company, was in the city last week.

Mr. H. M. Byllesby, who has just made an unsuccessful attempt to reorganize the Missoula, Mont., Lighting Company, has returned to the East.

Mr. Elmer Morris, late of Indianapolis, has returned to the employ of the General Electric Company and is engaged in the railway department.

Mr. John Dick, of the Phœnix Iron Works, Meadville, Pa., was looking over the New York territory last week.

GENERAL NEWS.

What is Going on in the Electrical World.

Milwaukee, Wis.—The street railway extension to Cudahy will be ready for operation about the 15th inst.

Alexandria, N. J.—A scheme for an electric road from this village to Redwood is again being agitated by business men here.

Parkersburg, W. Va.—The council has given the American Construction Company another franchise for a street railway.

Lyndonville, Vt.—At a special village meeting, recently held, it was voted to put in and operate an electric light plant at once.

Walsenburg, Col.—The electric light plant here was damaged by fire on the 21st ult.; the estimated loss was $6,000; no insurance.

Troy, N. Y.—The motive power of the Green Island branch of the Troy City Railway has been changed from animal to electric.

Scranton, Pa.—The proposition of the board of trade of West Scranton, to establish an electric light plant, is meeting with encouragement.

Tiffin, O.—The horse car line at Tiffin has been purchased by Hatcher & Yeager, who will immediately put in an electrical equipment.

Shrewsbury, Mass.—A construction company has looked over the proposed route for an electric railway to Worcester, and will give estimates in a few days.

Suffolk, Va.—It is proposed to build an electric road between Suffolk and Smithfield. A Smithfield business man has offered to donate a site for a power house.

Erie, Pa.—The business men of Parade street are organizing a company with the intention of operating an electric railway on Parade street and out to Four-Mile Creek.

Akron, O.—A number of local capitalists are about ready to form a company for the purpose of building an electric line from this city to Massillon, by way of Turkey Foot Lake.

Newark, O.—The county commissioners have granted a franchise to the Zanesville and Columbus Electric Railway Company to lay track through Licking County and operate an electric road.

Newburyport, Mass.—It is understood that a company for the manufacture of street cars has been organized at Newburyport in which W. B. Ferguson of the Milford & Framingham Street Railway Company, Milford, Mass., is interested.

Elkhart, Ind.—President Burns, of the Indiana Electric Railway, has awarded the contract for laying the track from here to Milford, Ind., a distance of 30 miles. The line will be extended to Fort Wayne, Ind., by way of Wolf Lake.

Winchester, Mass.—The proposed Mystic Valley street railway has been taken hold of by the owners of the Wakefield & Stoneham road, and the new line from Stoneham to Winchester will be built and operated under that control.

West Orange, N. J.—The township committee has received a petition for a franchise from the South Orange and Maplewood Railroad Company; a public hearing will be given to applicants on the 7th inst.

Elberton, Ga.—This city is now enjoying electric lights, the plant having been started up simultaneously with the opening of the Atlanta Exposition. The generating plant is located on Beaverdam Creek, three and one-half miles from town where there is a fine water power.

New Brunswick, N. J.—By means of mutual concessions the Raritan River Railroad Company and the Brunswick Traction Company have finally arrived at an amicable understanding which will permit the immediate extension of the trolley system from this city to South River.

Pittsburg, Pa.—The contract for building the Knoxville, Fair Haven and Mt. Lebanon Railway has been given to J. J. Houghton of Allegheny. The new line will parallel the Pittsburg & Castle Shannon Railroad and will be operated as a rival line by the Pittsburg & Birmingham Traction Company.

Brooklyn, N. Y.—A Brooklyn trolley-car company, it is stated, has given a firm of car builders an order for a number of cars to be used for winter "trolley parties." The cars are to be sumptuously furnished and arranged as to heating, light, seats, etc., so as to afford all the comfort possible.

Florence, Neb.—At the special election held here to vote on the proposition to issue $13,000 in bonds to aid in the construction of the Omaha and Florence Street Railway there was 150 votes in favor and only 31 against. The Omaha and Florence Street Railway Company will now proceed to construct the road.

West Chester, Pa.—Application has been made to Lansdowne borough council for the right of way through several streets for a trolley line to be known as the Suburban Railway Company. The road is to be built from Philadelphia to West Chester, through Cardington, along the Marshall road, then along Darby Creek through Tuscarora and Heyville and on to West Chester.

Athens, Ga.—The city council refuses to accept the offer of the Electric Light Company to sell their plant for $20,000, and have called an election to vote on bonds to erect an electric plant. The election is to take place October 26. The plant will be an arc system and the amount of bonds voted for $10,000.

Lima, O.—The right of way has all been secured for the Lima and Piqua Electric Railroad. The line will run through Wapakoneta, St. Mary's, New Bremen, Minster and a number of smaller towns. The company will build a belt line around this city if a franchise can be secured. The line will carry both freight and passengers.

Albany, N. Y.—A survey of the route of the proposed Albany, Hilderberg and Schoharie Railway has been made under the supervision of Engineer George Yost of Johnstown. As soon as maps are completed the company will apply for a charter. The cars will be run either by electricity or compressed air, and will carry both passengers and freight.

Edinboro, Pa.—The right of way for the proposed electric railway from Edinboro, Erie County, to Cambridgeboro has been secured from all but a few property holders along the line. Surveyors are also said to be at work looking up the best route from Cambridgeboro to Meadville. Much is said to depend on the obtaining of a franchise for a line in Meadville.

Cleveland, O.—A. L. Bagnall and T. Kogi, electricians, from Yokohoma, Japan, were among the names registered at the Hollenden a few days ago. Mr. Bagnall says that electric lights are in general use in the cities of Japan, and nearly all the stores are lighted by them. In portions of some of the streets the lights are paid for by individuals, for municipal lighting has not been taken up yet.

Milford, Mass.—The stockholders of the Hopedale and Milford Street Railway and Electric Storage Battery Company have sold all the stock and franchise of the

Hopedale and Milford Street Railway Company, excepting the power house, cars and shops, to the Milford, Holliston and South Framingham Company. The new owners expect to continue the road as far as Mendon this year.

St. Louis.—A consolidation of the American and St. Louis car companies is reported to be under consideration. If the companies take this step, it is proposed to establish a branch in the East and bid for the trade of that section. Beside street cars the new company will manufacture all styles of railroad coaches, especially those requiring electric power.

Baltimore—A. Morton Bell, of the Great Eastern Railway, England, has been inspecting the electrical equipment of the Belt Railroad and the operation of the electric locomotive employed in drawing freight cars through the tunnel, and expressed surprise at the success attained. Mr. Bell says there is much discomfort in the London tunnels from the smoke of the locomotives, and he thought that electricity had many opportunities in England for service similar to that of the Belt Line.

Keene, N. H.—The Keene electric railroad project has come to a temporary standstill, owing to the necessity of proceeding under the general law which was passed at the last session of the Legislature. Under this law the incorporators must go before the Supreme Court for authority to construct their road, just the same as if they were intending to build a steam railroad.

Fort Wayne, Ind.—It is the intention of the directors of the Fort Wayne & Hicksville Electric Railroad to apply at once for a franchise for an electric road from Fort Wayne to Bryan, O., a distance of forty-three miles. The company's officers are: President, James B. Colgrove, Washington, D. C.; vice-president, P. A. Randall, Fort Wayne; treasurer, Charles McCulloch, Fort Wayne; secretary, John B. Winn, Defiance, O.; superintendent, James B. Hart, Hicksville, O.

Utica, N. Y.—A Mr. Fremyear has been here promoting a scheme to combine the Belt Line street railways, the Bleecker street road, the Electric Light Company and the Gas Company in one company which would establish a great electric generating plant at Trenton Falls to furnish all the power needed in Utica for railway, lighting and manufacturing purposes, besides supplying other towns in that section with transmitted electricity.

St. Paul, Minn.—There appears to be a growing interest here in the subject of municipal lighting, and it is being discussed among members of the city council, business men and others. Councilman Arosin proposes to introduce a resolution providing for an inquiry as to the cost of the establishment and operation of an electric lighting plant by the city of sufficient capacity to light the down town district. The plan also looks to the ultimate lighting by electricity of all that portion of the city now lighted by gas.

Chicago.—The General Electric Railway Company has had agents at work quietly securing the consent of property owners along certain streets on the south side through which it proposes to run cars, and is said to have met with such success that the council will be asked in a few days to grant it a franchise for a new street railroad. The company will introduce the Brandenburg under-car electric system.—It is stated that the Chicago and Northern Pacific will let the contracts for changing the line into an electric road within the next thirty days. General Manager Ainslie is now busily engaged figuring on estimates.

Philadelphia.—The Pennsylvania Railroad Company is negotiating for the introduction of new electric storage batteries on its Chicago Limited train and will give the system a fair trial. If it is found better than the one now in use it will be put on all the limited trains. The introduction of electricity on all through trains of the Pennsylvania Railroad Company has been considered for some time, and the item of expense has been the only drawback. If the new storage batteries can be had at a price which will produce light at a cost not too much greater than that of gas it is more than likely that the cars will be lighted in the future by electricity.

Buffalo, N. Y.—The Buffalo & Niagara Falls Electric Railway has been formally opened and cars are now running daily on a 15-minute schedule. The maximum speed attainable is 40 miles an hour. The motor cars carry four motors and have seating capacity for 44 passengers; they are of improved pattern and were built by the Brill Company of Philadelphia. The trailers will seat 50 passengers.—The test of electricity as a motive power on the canals, which was advertised to take place on the 25th of September, did not come off. The only explanation offered is that the company has not had time to fit up the experimental line.

Ann Arbor, Mich.—Two electric railway schemes of considerable magnitude are being agitated here. The first one concerns the purchase of the Ann Arbor & Ypsilanti motor line, at present run by steam power, by J. R. McDonald, of Detroit, who now has an option on the road and who is operating for Eastern capitalists. The second scheme is the project of an electric road to Detroit, via Ypsilanti, Shelden, Denton, Wayne and Dearborn, to Detroit. Thos. D. Kearney, of Ann Arbor, is attorney for the Eastern men who are pushing the enterprise. He confidently asserts that the proposed road will be built, equipped and in operation by October 1, 1896. The right of way has been secured for a large share of the distance between here and Detroit.

Los Angeles, Cal.—The completion of the Alpine section of the Mount Lowe electric road brings the terminus of the line to the snows which prevail on the mountain in winter. In recognition of the pleasures made accessible by this fact, the Alpine Club of Los Angeles has erected at the terminus a commodious clubhouse and proposes to open this winter a series of winter pastimes, made possible by the presence of abundant snow. These will include sleighing and toboggan slides. Thus the remarkable fact is presented of winter pleasures in the heart of a semi-tropical region. It will require but an hour to traverse the distance separating the orange groves and rose gardens of the valley from the deep snows of winter.—The council has given public notice of sale of a franchise for an electric railway in certain streets of this city, to be held on the 14th of October.—The cable roads of the Consolidated Company are to be changed at once into electric lines. Forty cars have been ordered to replace the cable cars now in use.

Washington, D. C.—At a meeting last week of the stockholders of the Washington and Georgetown Railroad, the agreement entered into between Presidenr George T. Dunlop of that company and President Francis G. Newlands, of the Rock Creek Railway, bettet known as the Chevy Chase electric line, was ratified. Under the agreement the Rock Creek Company absorbs the Washington and Georgetown Railroad Company, and the combination has taken the name of Capital Traction Company. The old officers of the Georgetown and Washington Railroad Company have been elected officers of the new company. They are: G. T. Dunlop, president; Charles C. Glover, vice-president; C. M. Koons, secretary and treasurer; C. C. Sailer, general superintendent, and D. S. Carll, chief engineer. The directors are: George T. Dunlop, Charles C. Glover, Henry Hurt, John G. Park, John R. McLean, Robert Beall and F. G. Newlands.—The Eckington Railway Company has awarded a contract to E. Saxton to equip its lines in this city with an underground electric system, the work to be done some time next summer.

COMMERCIAL PARAGRAPHS.

Mr. W. H. Mackay, the New York agent of the Columbia Lamp Company, is doing a good business for his company. Among the many orders booked last week was one for 10,000 lamps.

The Crouse-Tremaine Carbon Co. of Fostoria, Ohio, have been doing a constantly increasing business in Cored Carbons since putting them on the market. That central station men consider them in every way satisfactory is evidenced by the fact that orders for over 600,000 were booked in September. One order was also taken by this firm in September for 1,000,000 carbons.

The Partridge Carbon Company, Sandusky, O., is being kept busy these days to supply the rapidly increasing demand for the Partridge Motor Brushes.

The J. H. McEwen Manufacturing Company, manufacturers of the McEwen Automatic Engine and the Thompson-Ryan Dynamo, have removed their general sales office from Ridgway, Pa., to the Havemeyer Building, New York City.

INCORPORATIONS.

The D. E. Boswell Company, Chicago—to manufacture electric apparatus. Capital stock, $2,000. Incorporators: D. E. Boswell, A. A. Brown and T. B. Lambert.

The Asbury Park, Bradley Beach, Belmar and Spring Lake Street Railway Company, Bradley Beach, N. J.—to construct, maintain and operate a street railway for the transportation of passengers, construct and operate motors, cables, etc. Capital stock, $75,000. Promoters: Henry C. King, New York City; Alex. Bogey, Brooklyn, N.Y.; N. E. Buchanon, John Hubbard, Asbury Park, N. J.; Chas. H. Seaman, Bradley Beach.

The Warwick Electric Manufacturing Company, Cleveland, Ohio—to manufacture and deal in storage batteries, dynamos, motors, arc lamps, electrical appliances, and erect and maintain isolated electric lighting plants. Capital stock, $20,000. Promoters: P. B. Warwick, Dan. H. Ridgway, Geo. F. Ridgway, Michael Phalen, C. N. Cunningham.

The Fort Wayne and Hicksville Electric Railway, Fort Wayne, Ind.—to construct, own and maintain a street railway in Fort Wayne. Capital stock, $50,000. Promoters: John S. Hart, Hicksville, Ohio; Jas. B. Colgrove, Washington, D. C.; John W. Winn, Defiance, Ohio; Aaron M. Richelderfer, Harlan, Ind.

The Globe Electric Company, Cleveland, Ohio—to manufacture and sell electric telephones and other electrical and magnetic apparatus, and to do a general electrical business. Capital stock, $25,000. Incorporators: C. E. Collins, L. W. Bradley, Donald McKenzie, T. W. Larwood, Jr., and J. D, Barron.

The James D. Gray Steam Engine and Motor Company (incorporated in W. Virginia), Baltimore, Md.—to manufacture, purchase and sell steam engines, electric motors, batteries, dynamos, etc. Capital stock, $1,000,000. Promoters: P. V. Benson, M.D., R. Brent Walling, Ernest Sharp, Wm. S. Taylor, Baltimore.

The Citizens' Electric Company, Williamsport, Pa.—to supply light, heat and power by means of electricity to the public in Williamsport, Pa. Capital stock, $2,000. Promoters: Grant Sweet, C. H. Hill, Williamsport; Ray R. Sweet, Canton, Pa.

The Newton Electric Company, Newton, Ia.—to manufacture, generate, furnish and supply electricity for light, heat and power. Capital stock, $25,000. Promoters: B. E. Sunny, James S. Cumming, Chicago, Ill.; H. M. Vaughan, Newton.

The Ohio and Indiana Natural Gas Company, Indianapolis Ind.—to manufacture, mine and bore for gas and oil: transport natural, artificial and illuminating gas or oil and electricity for light, heat and power. Capital stock, $110,000. Promoters: Edw. Hawkins, Indianapolis; Richard G. Kerlin, Toledo, Ohio; Henry B. Smith, Hartford City, Ind.

The Huntington, Columbia City and Ligonier Electric Railway Company, Columbia City, Ind.—to construct, maintain and operate electric street railroads in the cities of Huntington, Columbia City, Albion and Ligonier. Capital stock, $50,000. Promoters: Vallorous Brown, Geo. W. Ruch, Joe. H. Ruch, Thos. R. Marshall, Wm. F. McNagny.

MOONLIGHT SCHEDULE FOR THE UNITED STATES.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED SEPTEMBER 24, 1895.

ELECTRIC LIGHTS AND APPLIANCES.

546,666. Means for Varying Light for Incandescent Electric Lamps. Charles A. Hussey, New York, N. Y., assignor, by mesne assignments, to the Electric Company, same place. Filed Sept. 29, 1893.

546,689. Electric-Arc Lamp. Conrad Weber, Friedrich Goelner and Albert Schweitzer, Allegheny, Pa. Filed Nov. 19, 1894.

546,790. Electric-Light Display System. Jonathan E. Woodbridge, Duluth, Minn., assignor to the Electrical Advertising and Sign Company of Maine. Filed Jan. 8, 1895.

546,826. Electric-Arc Lamp. Rupert Scheflbauer, Paterson, N. J., assignor to the Auerbach-Woolverton Electric Company, New York, N. Y. Filed Nov. 16, 1894.

546,827. Electric-Arc Lamp. Rupert Scheflbauer, Paterson, N. J., assignor to the Auerbach-Woolverton Electric Company, New York, N. Y. Filed March 5, 1895.

546,828. Electric-Arc Lamp. Rupert Scheflbauer, Paterson, N. J., assignor to the Auerbach-Woolverton Electric Company, New York, N. Y. Filed March 5, 1895.

DYNAMO ELECTRIC MACHINERY, ETC.

546,691. Continuous-Current. Rectilinear Motor. Charles E. Woods, Chicago, Ill., assignor, by direct and mesne assignments, to the C. E. Woods Company, same place. Filed April 6, 1895.

546,724. Electric System. Merle J. Wightman, Johnstown, Pa. Filed April 3, 1895.

546,756. Production of Displaced Phases and Rotary Fields. Charles S. Bradley, Avon, N. Y. Filed Dec. 24, 1894.

546,874. Electrical Indicating System for Annunciators. Walter F. Banks, Milford, Conn. Filed Oct. 2, 1888.

546,901. Attachment for Electric Generators. George W. Pickett, Denver, Col., assignor of nine-sixteenths to Samuel Lesem, same place. Filed Jan. 12, 1895.

546,966. Electrical System of Motor Regulation. Merle J. Wightman, Johnstown, Pa. Filed March 27, 1895.

TELEPHONE AND TELEGRAPH APPARATUS.

546,725. Self-Acting Commutator for Telephones. Saleman Berditschewsky dit Apostoloff and Moise Freudenberg, Paris, France. Filed March 27, 1895.

546,731. Telephone System. William W. Dean, St. Louis, Mo., assignor to the Bell Telephone Company of Missouri, same place. Filed May 18, 1895.

546,892. Telegraphic Vibrator. Paul La Cour, Askov-Jus, Denmark, assignor to Karsten Viborg Tuxen, Brooklyn, and Peter Hoykendorf, New York, N. Y. Filed May 7, 1895.

546,904. Combined District Telegraph and Telephone System. Edgar E. Salisbury and Albert E. Dean, Tacoma, Wash. Filed Aug. 21, 1894.

546,965. Telephone. George A. Tower, Maurice Hunter and Joseph P. Eastwood, Richmond, Va., assignors of one-fourth to Maurice W. Thomas, same place. Filed Dec. 20, 1894.

546,972. Telephonic Attachment. Louis J. Gerson, Philadelphia, Pa., assignor of one-half to Charles Heritage, same place. Filed Jan. 14, 1895.

MISCELLANEOUS.

546,674. Electric Time-Switch. James F. McLaughlin, Philadelphia, Pa., assignor to James W. Difenderfer, same place, and Theodore H. Gehly, York, Pa. Filed April 11, 1893.

546,682. Apparatus for Exterminating Vegetation. Albert Scheible, Chicago, Ill. Filed Jan. 22, 1895.

546,700. Means for Analytically Recording Gait of Horses. Thomas J. Kean, Philadelphia, Pa. Filed Dec. 5, 1894.

546,739. Method of Making Porous Plates or Electrodes. John Johnson and James H. Robertson, Brooklyn, N. Y. Filed April 2, 1895.

546,802. Screening Electrical or Other Instruments and Apparatus. William E. Ayrton and Thomas Mather, London, England. Filed July 3, 1893.

546,820. Electric Switch. George E. Linton, Worcester, Mass. Filed Jan. 4, 1895.

546,821. Electric Switch. George E. Linton, Worcester, Mass. Filed Jan. 4, 1895.

546,884. Electromagnet for Pipe-Organs. Edwin S. Votey, Detroit, Minn., assignor to the Farrand & Votey Organ Company, same place. Filed Jan. 21, 1895.

ELECTRICITY.

Vol. IX. NEW YORK, OCTOBER 9, 1895. No. 13

ELECTRICITY

Published every Wednesday by the
ELECTRICITY NEWSPAPER CO.
B. E. GREENE, PRESIDENT.
L. J. MONTGOMERY, SECRETARY.

Publication Office, - - 6 Park Place, New York.

EDITORS: NELSON W. PERRY.
BURTON E. GREENE.
R. H. WILLOUGHBY.

BUSINESS MANAGER, - - - JOHN L. GANS.

SUBSCRIPTION RATES:

UNITED STATES, - - - - - - - - - $2.50
IN CLUBS OF FIVE OR MORE, - - - - - - - 2.00
FOREIGN COUNTRIES, - - - - - - - - 4.50
SINGLE COPIES, - - - - - - - - 10 cents

ADVERTISING RATES:

As ELECTRICITY reaches all classes interested in electrical work, its value as an advertising medium can be readily understood. Rates will be sent on application.

Changes of advertisements should reach the office not later than the Saturday preceding the day of publication.

Entered at the New York Post Office as second-class mail matter.

THE TRADE SUPPLIED BY
THE AMERICAN NEWS COMPANY,
THE WESTERN NEWS COMPANY,
and their Agencies in all principal cities.

The Berliner Patents.
Why the Bell Company is a Trust.
To Sell Telephone Privileges.
Will Pay to be Sued.

EDITORIAL NOTES.

The Telephone Situation. A correspondent, interested in the construction and operation of independent telephone exchanges, writes to ELECTRICITY making some pertinent inquiries on the telephone situation. He desires to know—(1) What is the present attitude of the Berliner case? (2) Have you any comments to make as to the probable outcome of the case and its effect on the new companies? (3) What action would you suggest on our part as to the situation? (4) Can any estimate be safely made as to the time when a decision may be reached in the pending suit?

The points involved in answers to the above questions being of as great general as individual interest, we take this method of replying.

1. There are in fact two Berliner cases now occupying the attention of the telephone world. The first has reached the third and final stage and had its origin in the bill in equity filed by the Attorney-General of the United States against the Bell Company, February 9, 1893, in which it was alleged that the Berliner transmitter patent of November 17, 1891, was an illegal grant and it ought of right to be annulled. The decision of Judge Carpenter of the Circuit Court of the Massachusetts District and the subsequent reversal by the Circuit Court of Appeals are of too recent occurrence to require further mention. A few weeks ago the decision of the Court of Appeals was appealed to the Supreme Court of the United States. The case has been docketed at Washington to be heard in the regular course.

To rightly understand the situation, it must be borne in mind that the decisions already rendered in the Government suit on the Berliner patent have not determined the validity of the patent. The reversal of Judge Carpenter simply rehabilitates the patent, leaving it on an equal footing, before the law, with any other patent owned or controlled by the Bell Company, or by anyone else.

The second and more important of the Berliner cases is the suit of the Bell Company for an order to restrain the National Telephone Manufacturing Company, the Bay State Telephone Company and the Century Telephone Company of Boston from alleged infringement of the Berliner 1891 patent. The bill of complaint was filed August 6. At the hearing assigned for September 3, thirty days were given in which to file an answer to the bill of complaint. At the expiration of this time, on the 3rd inst., an order was issued extending the time for filing answer until October 15.

2. The granting of an injunction in the Boston cases will, of course, affect directly and immediately only those companies against whom action is brought, but it is to be presumed—in fact is so declared by the Bell Company—that similar action will be taken against not only other alleged infringers in the Massachusetts judicial district, but wherever found.

The manufacturers of telephone apparatus now on the market all claim that they do not infringe any patents not controlled by them. Such is presumed to be their own or their attorneys' opinion, and while it is reasonable to suppose that the genius of one or two men, allied to or employed by the Bell Company, has not been so transcendent as to render it impossible for others to accomplish the same or better results by improved if not better means, the fact remains that none of the new forms of apparatus has been judicially declared to be non-infringing except the magneto instrument which requires the use of no switch and hence evades the Watson patent.

The Berliner patent alone, if valid, practically controls commercial telephony so far as it is dependent upon microphones operating upon the constant contact principle. We have always maintained, however, and still maintain, that commercial telephony is *not* dependent upon anything contained in the Berliner claims. The Bell Company have educated the public to believe that this patent is necessarily the sole key to the situation, but in our opinion this is a sheer fallacy.

A new telephone exchange company, to be safe, however, should procure their apparatus of those manufacturers who are not only able but willing to guarantee their customers absolute immunity from damages for infringement of patents. The purchasers should see to it that the guarantees given have no loopholes in them.

3. As has been repeatedly pointed out in these columns, the chief hope for the independent telephone manufacturing companies lies in the defeat of the Berliner patent, because if that patent is out of the way the open field is much broader. Its validity can be successfully attacked in a properly prepared and conducted case. It is eminently desirable to the public that the Berliner patent should be defeated, but the sole recourse of the independent companies does not lie in its defeat. The old magneto instrument, the patent for which expired with the original Bell telephone patents, makes a far better transmitter than most people are aware. Good and distinct articulation has been given with this instrument over *grounded* circuits between New York and Cleveland and between New York and Chicago. If specially wound for long distance transmission, its service over these distances could doubtless be far improved, and on metallic circuits be made even better than with transmitters of the variable pressure type, as it already is for short distances. The public have been too willing to believe the dictum of the Bell Company that the variable pressure microphone gives them the monopoly of the business or even gives them the best instrument. Even if the Berliner patent is sustained,

the independents should not lie down, but should set their ingenuity to work to improve transmitters on the magneto principle until they attain an instrument that is in every way better than any now made on the principles covered by the patent in suit.

4. Judged by the length of time other cases have been awaiting disposition by the Supreme Court, it may be two years before a decision is rendered.

The Gas Engine Business in America.

There is no journal in this country that appreciated earlier than this the possibilities of the gas engine in the electrical industry. There is no one that has investigated the subject more fully than we, and there is no one that has been so utterly disgusted with the way in which the gas engine business has been conducted.

Having early seen the advantages that would accrue both to the gas engine and electrical interests by bringing them into closer acquaintance, we endeavored at least two, perhaps three, years ago to induce the gas engine interests to cultivate the electrical trade and pointed out clearly how this could advantageously be done.

The gas engine manufacturer, however, as a business man has been unique. When approached for information as to his wares he became suspicious, wanted to know the pedigree of the inquirer, who his grandfather was, and who his aunt, and if the answers were not entirely satisfactory, shut himself up in his shell and nothing would he say. With perhaps one or two exceptions, no price lists were published, and even list prices would not be quoted unless the exact purpose for which the information was desired was stated.

When suggested to the gas engine man that there was a wide field for it in isolated electric lighting, instead of cultivating that field and encouraging others to take hold of it and use his engines, he said, as the New York agent of the Otto Gas Engine Company actually did say to an electrical engineer who applied to him for information, that no one in this country could go into the electric lighting business with gas engines "but us," and the home office when written to in regard to it practically endorsed the attitude of the agent.

Not only has this business policy been pursued in regard to the electrical industry, but also to others, until all classes of inquirers have become discouraged with American treatment, and where the magnitude of the undertaking has warranted, have gone abroad, where their inquiries have met with respectful reply. In many cases purchases have been made abroad of engines that have proved themselves to be no better than those made in this country, but the feeling has become general that the English, Germans and French make better gas engines than we. This we are loth to admit, but the fact is that the foreigners adopt rational business methods which American manufacturers of gas engines seem to have carefully avoided.

In the electrical line with which we are most familiar, the leading manufacturers who have attempted to corral the business to themselves have, through a lack of knowledge of the requirements and an unwillingness to ask assistance from those who possessed it, made the adaptation of the gas engine but a record of failures. With a few notable exceptions every gas engine lighting plant in this country has proved more or less unsatisfactory, and it has been the manufacturer rather than the engine that has been at fault.

Once in a while, when the manufacturers have seen a *very* desirable business opportunity slipping from their fingers, they have gotten down on their knees and endeavored, when too late, to retrieve the lost contract.

As illustrative of the foregoing, the De La Vergne Refrigerator Company, desiring a small motor for their refrigerating machines, inquired not long ago into the merits of the American gas engines. Being disgusted with the information obtainable they went abroad. Not being satisfied that the foreign engines were any better than ours, they considered very seriously the feasibility of building their own gas engines. Then the gas engine men fell all over themselves—to use a slang phrase and to quote Mr. Richmond's remarks at the April 10 meeting of the Mechanical Engineers—"I got as much as 40 per cent. discount quoted at the first slap. I don't know how much I could get by negotiation." He further said that the manufacturers then proposed that the De La Vergne Company, if they did manufacture, should add 200 or 300 per cent. profit, and then divide half and half.

In commenting upon the situation at the time (issue of May 29) we said:

"If, as implied by Mr. Richmond, the present prices include 200 or 300 per cent. profit, this new competitor will be satisfied with 25 or 50 per cent. Whether or not the present manufacturers continue to require your pedigree and certificate of character before they will impart any information, the new competitor will require no other credentials than other business men require and facts will be freely and fully given. Whether or not the present manufacturers will continue to try to monopolize the use of their own engines for electric lighting (a business which they have generally shown themselves totally incompetent to handle), and give guarantees that are not worth the paper they are printed on, the new competitor will be glad to sell to everyone who can pay a fair price for his engine, and he will sell to them low, and give a guarantee that can be relied upon in every particular. The American public and ELECTRICITY will welcome this competitor with open arms. We all hope he will be an American, but we will welcome him anyway if he changes, as he must, the present order of things."

And in referring to the American manufacturers we said:

"Do the latter think they can compete under their present policy with competitors, even from abroad, who not only know what they have but are willing and anxious that the world should also know it?"

Since then a very live English firm has established an agency in New York, and one of the largest American manufacturers of gas engines has been compelled to turn his business over into the hands of a receiver.

It is now announced that the new factory of the Weston Instrument Company, which is to be many times larger than the present one, and Arbuckle Bros.' coffee establishment, the largest in the world, are to be equipped throughout with gas engines purchased abroad. These results are but the legitimate outcome of the policy which we have condemned, but the end is not yet. There is a brighter lining to the cloud, which consists in the announcement that the Westinghouse Electric and Manufacturing Company is going into the manufacture of gas engines. We hail this announcement with genuine delight, for it means a revolution in the gas engine business of this country. If the Westinghouse Company turn out a good engine and put it on the market with their accustomed business ability, those now engaged in the business will have to reverse their business methods or go out of business.

Taking coal as our starting point, the maximum theoretical efficiency of the steam engine is 30 per cent. Its obtained efficiency is perhaps about 13 per cent. The maximum theoretical efficiency of the gas engine is 80 per cent. and its obtained efficiency is 20 to perhaps 25 per cent. There therefore appears to be a very easy possibility that the obtained efficiency of the gas engine may some time reach more than double the theoretical efficiency of the steam engine, and when this time arrives there will still be leeway for as much improvement as there now is in steam engine economy.

We are glad that the Westinghouse Company have taken hold of the gas engine business, and while it is not to be expected that the theoretical possibilities will be approached with giant strides or better than a halting gate, yet we feel assured that the entering of this field by business men has rescued the American gas engine business from destruction. All industries will be benefited by a good gas engine put on the market in a business-like way, but none more so than the electrical industry.

Under the Searchlight.

Views and Opinions on Timely Topics.

WE are pleased to chronicle the following, which was given out over the signature of Mr. W. B. Rankine:

> "Allow me, in behalf of the Construction Company and the Niagara Falls Power Company, to correct this statement [that these companies were concerned in the electrical tests for canal haulage]. Neither of these companies has anything to do with the preparations for or the carrying out of the proposed tests."

A few days later we received a notification from Mr. Frank W. Hawley, vice-president, and Charlton T. Lewis, secretary, of the Cataract General Electric Company, that there would soon be another "canal experiment" at Tonawanda. We wish Mr. Rankine would go a step farther now and tell us just what relation the Cataract General Electric Company bears to the two companies mentioned by him, and who is supplying Mr. Frank W. Hawley with the money which keeps up this serio-comic show. We know Mr. Hawley too well to suppose that he is laboring exclusively for the good of the canals or of the State.

* * *

Straight Tips for Advertisers.

Expert D. E. Goe, of the Central Electric Company, Gives to the World the Benefit of His Vast Experience.

(From the Trade Press, Chicago.)

One of the best posted advertising men in the city is Mr. Goe of the Central Electric Company, whose portrait appears in another column. He dispenses the advertising patronage of one of the largest electric companies in the West.

Mr. Goe is not a difficult man to approach on the subject of advertising, for, like all men who know considerable about the advertising business, he is always on the alert to catch new ideas, and he will listen, of course, if your story is interesting and not too long. It might be well to add also that he generally insists on knowing very nearly what he is doing when he signs an advertising contract. As a result of this caution, he says there is only one out of the seven electrical journals he is using that would not give him satisfactory evidence of its circulation. Whether or not the other fellows were able to hoodwink him of course is a question.

The journals he has found to pay in Chicago are *Electrical Industries*, *Western Electrician* and *Electrical Engineering*. In the first named he uses a full page, and also uses the same space in *Electrical Engineering*. In the *Western Electrician* he alternates a page and a half page. He makes use of four of the large New York journals, and places their importance in the order named below. The *Electrical World*, alternate page and half-page; *Electrical Review*, alternate one-half and one-quarter page; *Electrical Engineer*, alternate one-half and one-quarter page, and ELECTRICITY, one-fifth page.

It would be unpardonable presumption to dispute the correctness of the views of Mr. Goe. Like Prof. Forbes, he is supreme in his line, and his record shows it. Since he came into the electrical field over $50,000 of other people's money was spent on his education in the science of advertising while he was conducting *The Electric Spark*. We know of few people who have had such favorable opportunities to become experts. The only wonder is that a man who knows so much should have been associated with so many failures, and holds even at the present time such an obscure position. He must be a victim of persistent hard luck, but we assure him of our most distinguished consideration.

* * *

A FEW months ago suit was brought by E. R. Gilman to recover from Mr. George C. Duffie five $1,000 bonds of the Faribault Consolidated Gas and Electric Company, the plaintiff claiming that Mr. Duffie did not own the bonds; that he (Gilman) had paid Mr. Duffie for them. It was shown in rebuttal that the only consideration ever received by Mr. Duffie was a $1,200 check drawn by Gilman which went to protest. Mr. Duffie won.

General Electric.

(From the Boston News Bureau.)

General Electric people have obtained good legal advice to the effect that the General Electric preferred stock cannot be scaled.

It is believed in well informed quarters that when the General Electric is ready to resume dividends the common stock will be scaled by making its par $50, or issuing one share of the par of $100 for each two shares now outstanding and that the back dividends will previously be paid on the preferred stock; $14 per share had accumulated up to last July.

The General Electric is doing a business of over $15,000,000 gross per annum, and is earning at the rate of $3,000,000 net per annum, but making allowances for some "writing off" at the end of the year, it cannot be said that the stock is yet earning much more than $8 per share. Not until the company is earning a fair dividend will the stock be scaled.

A General Electric man says: "What we really need in the electric field is an agreement with Westinghouse and higher prices for apparatus, but Westinghouse is a very difficult man to treat with. He is way up in the air and won't come down."

This comes from Mr. Coffin's home organ, and may be taken as his view of the field.

The statements of supposed fact may be accepted as being just as true as the first, second or third annual report of the General Electric Company.

* * *

The *American Engineer*, one of the best monthlies on our exchange list, announces that after November 1 the journal will be published bi-weekly, and will appear every alternate Thursday. Each number will contain one-half as much reading matter as is now given in the monthly issue. The price, per number, will be reduced to 10 cents, and the annual subscription to subscribers in this country, Canada and Mexico to $2.50. It is wisely thought that the more frequent publication will enable our contemporary to keep more closely in touch with current events and the advancement of engineering art and science, and that the change will materially increase the interest of the paper to its constituents.

* * *

The London correspondent of the New York *Sun* writes that the experiment of installing the telephone by trotting cavalry has been successfully undertaken by the Prussian Uhlans between Berlin and Potsdam. Two sets of officers proceeded respectively from Berlin and Potsdam. Each set was equipped with complete telephone apparatus, which, together with the requisite quantity of small wire, was carried by one of the men in a leather case. The end of the wire was, by means of a fork fixed at the end of a lance, thrown over the tops of trees along the road. As each kilometer of wire was thus suspended a halt was made to ascertain whether there was connection with the station. The two sets met at Teltow, where the wires were connected and telephonic connection between Berlin and Potsdam was established. The distance is twenty miles, and the task was completed in about four hours.

The Thomson Regulator Patent.

WESTERN ELECTRIC WINS ON APPEAL.

(Special Dispatch to Electricity.)

Chicago, Oct. 8.—In the United States Circuit Court of Appeals decision has again been given for defendant in the case of the Thomson-Houston Company vs. the Western Electric Company for alleged infringement of the Thomson Regulator Patent.

Judge Grosscup had decided on January 14 last that there was no invention involved. This decision is now sustained.

It will be remembered that Judge Colt's unjust decision sustaining this patent had the result of driving the old American Company (Goff's) out of business.

GENERAL ELECTRIC'S FINANCING POLICY.

CHAPTER XII.

The Faribault Plant.—II.

(*Concluded from page 142, September 25.*)

In concluding the first chapter of our analysis of this Faribault plant, we showed from the official statement of the company that there was a deficiency for the year ending April 30, 1893, of $9,682.02 in operation.

In the first trial balance, made up under the Byllesby regime, the item of plant account was $1,243.99, and notes payable $12,360.87. The following trial balance was made up one month later:

[copy.]

FARIBAULT CONSOLIDATED GAS AND ELECTRIC COMPANY.

TRIAL BALANCE FOR ONE MONTH ENDING MAY 31, 1893.

Plant account	$175,000.00	
Electric plant	1,243 99	
Street lines and wire	3,995.60	
Wiring	153.15	
Tools and fixtures	25.87	
Faribault Boot and Shoe Company	162.15	
Meters	1,249.59	
Transformers	1,030.74	
Accounts receivable	1,173.50	
Cash	851.41	
Salary of superintendent	125.00	
Wages of engineer and fireman	105.00	
Lamps	124.12	
Traveling expenses	6.00	
Repairs to electric plant	2.50	
Carbons	10.00	
Profit and loss	2,817.99	
		$188,076.61
Credits.		
Capital stock	$100,000.00	
Bonds	75,000.00	
Notes payable	6,546.87	
Northwest General Electric Company	5,674.72	
Earnings	855.02	
		$188,076.61
Interest.		
Interest on bonds	$4,500.00	
" " notes	237.82	
		$4,737.82

It may be presumed that the above was made up by Mr. Byllesby's agents, under instructions, when another effort was being made to dispose of the stocks and bonds of the Faribault Consolidated Gas and Electric Company. The "plant account" is put down at $175,000, the electric plant at $1,243.99, while the floating debt remains about the same, $12,221.59.

It cannot escape those interested in the methods of Byllesby and Coffin and their remarkable system of bookkeeping that this plant account is just equal, in their official valuation, to the amount of securities issued, $175,000.

As before stated, Mr. Gilman had originally invested in this property $20,000 for the gas plant, and $1,600 for the electric outfit in 1889. Subsequently much new electrical apparatus and equipment was added, for which over $12,000 in notes were given to the Northwest General Electric Company. In 1893 the source of supplies was cut off, as the Northwest Company was no longer able to get credit from the General Electric Company in New York. From that time on the Faribault plant has had to stand on its own bottom.

One thing which will at once strike the central station man as peculiar is the large amount of apparatus, supplies, etc., which this plant had bought. The pole line construction was enough for a city of 20,000 people, and there were enough supplies on hand for a station three times the size of this one. Those familiar with the affairs of the Northwest Company know why this was so. Those in authority received commissions on everything sold to the various stations, and they were consequently very liberal buyers.

But even with all the stuff bought, they had been unable to get more than $40,660.21 invested in the entire plant, on which nearly $75,000 was raised from the sale of bonds. What became of the remainder of the money we leave to Mr. Coffin, Mr. Gilman and Mr. Byllesby to explain. Some of it perhaps was devoted to the purchase of yellow dogs, some to paid-up life insurance policies, and some perhaps found its way to Boston.

In the early part of 1893 the plant may be said to have been at high-water mark. Following Gilman, Messrs. Coffin and Byllesby stood sponsor for it; its affairs and its securities were manipulated by them. There was in the market $100,000 of stock and $75,000 of bonds.

Now we propose to show what basis there was for this capitalization. We present below the complete schedule of property. The valuations are made by us, and are in error, if at all, on the side of liberality:

SCHEDULE OF PROPERTY OF THE FARIBAULT CONSOLIDATED GAS AND ELECTRIC COMPANY.

March 1, 1893.

REAL ESTATE.

Lots—¾ of lots 1, 2, 3 and 4 and all of lots 5 and 6, block 18.
Paquin's 2d addition.
Buildings—Brick electric light station, 40 ft. x 20 ft.
Frame boiler house, 35 ft. x 17 ft.
Frame coal shed, 20 ft.x40 ft.
Frame coke shed, 30 ft.x20 ft.
Stone gas house, 60 ft.x45 ft.
Frame residence, 200 ft. from station.
Frame gas holder house.
Sheet iron naphtha tank, capacity 10,000 gals.

STEAM PLANT.

One Russell engine, 11x22; 2 pulleys at 66 in.x 12 in. One steel boiler, 60 in.x16 ft. Robinson & Carey. One vertical boiler, 5 H.P. One Hazelton boiler, 75 H.P. One Blake pump, size 2½. One Barr Pumping Engine Co.'s, duplex pump, size 5. One wooden water tank, 16x5½ x 3 ft. 6 in. outside measure. One water tube feed water heater, Goubert Mfg. Co., N. Y. One brick boiler setting containing 20,000 brick.	$5,500

ELECTRIC PLANT.

One A—6 alternator, estimated	$300.00
One K—4,089 arc dynamo	850.00
One A—18 alternator	550.00
One D—3 exciter	132.50
One pair arc lightning arresters	14.00
Two arc regulators, 6.8 amp	100.00
Two ground detectors, inc	40.00
Two potential indicators	60.00
Two ampere indicators	41.00
Five bank boards, I., 63 amp	50.00
Seven type F. lightning arresters	49.00
Two D. P. D. throw S. B. switches, 300 amp	60.00
Three buckle switches	30.00
Two station transformers	120.00
12 ft. 3" lt. sgl. belt	20.40
One Schieren perforated belt, 10", 24' C. to C.	96.30
One Munson double, 8 in., 14' C. to C.	31.35
One type 143 rheostat	70.00
One Munson double 6 in. 19' C. to C.	41.50
One type 37 rheostats	40.00
One type 65 rheostat	20.00
Two No. 8,170 feeder block	12.00
60 ft. No. 4 Okonite	12.00
One 50 amp. D. P. switch	10.00
4 D. P. 75 amp. S. B. switch	10.00
Two potential switches	9.00

SUPPLIES.

½ bale cotton waste	$12.50
1 bbl. cylinder oil	22.50
½ bbl. dynamo oil	6.25
1 bbl. machine oil	15.00
⅓ bbl. boiler compound	8.00
11 arc lamps, 1200 C. P. single carbon	220.00
20 16 C. P. lamps	8.00
20 32 C. P. lamps	10.00
50 25 C. P. lamps	22.50
4 arc lamp hoods	11.00
2700 gals. naphtha in tank	270.00
1 extra armature for K. 4089	425.00
1 extra armature for A. 18	275.00
Tar, 400 gals	40.00
1 commutator for A. 18	50.00
Total	$9,664.80

Total brought forward	$9,664.80

POLE LINES (ERECTED).

10 1,200 C.P. sing. carbon arc lamps	$7,642.41
100 street hoods	
10 arc lamp hoods	
100 alternating street series sockets, No. 9,015	
5 junction boxes, No. 7,645	
110 removable pin break arms	
500 2 pin cross arms	
500 ½x7″ lag screws	
2,500 D. P. D. G. glass insulators	
1,000 feet flexible wire cable	
1,000 oak brackets, 1½ in	
1,964 lbs. No. 1 feeder wire	
2,381 lbs. No. 10 W. P. wire, street circuit	
8,078 lbs. No. 8 W.P. wire, street circuit	
50 gal. iron cross arm braces	
500 No. 4 porcelain insulators	
455 30-foot cedar poles	
52 35-foot cedar poles	
78 25-foot cedar poles	
12,480 feet No. 6 Under. wire	
10,640 feet No. 8 Under. wire	
17,160 feet No. 6 Under. wire	
14 transformer lightning arresters	
26 sleet-proof pulleys (Cutter's)	

TOOLS AND FIXTURES.

1 pair Stubbs' pliers, 8 in	$1.80
1 pair Stubbs' pliers, 6 in	.80
1 pair Stubbs' pliers, 5 in	.70
1 pair copper snips	1.75
1 augur, 1 in	.75
Bits, one ¾, one ⅝, one ½, one ¼	.84
Corner brace, (one)	3.00
I brace (straight)	1.25
1 back saw	1.00
5 wrenches for engine	7.00
2 pipe cutters	8.00
5 files	2.00
1 screwdriver	.40
1 vise and strap	3.60
1 clock	5.00
1 clawhammer	.60
1 level	2.00
2 wooden chairs	3.00
1 bench vise	8.00
1 ratchet	2.75
1 stove	6.00
Pipe Cutting Dies—Two ½ in., two 1 in. left; two ½ in., one ¾ right; two ½ in., one ¾ left; two ½ in., two ⅜ right; two ½ in., one ½ right; two ½ in., one ⅛ right; 4 in., three 2 in. right; 4 in., one 2 in. left; 4 in., one 1 in. right; 4 in., one 1½ in. right; 4 in., one 1 ¼ in. right; 2 die stocks, from ¼ in. to 1 in	37.50
5 brass brackets	5.00
1 grindstone	4.00
Taps—One 2 in. right; one ¼ in. right; one 1 in. right; one 1 in. left; one ¾ in. right; one ½ in. right; one 1 ½ in. right; one 1 in. right drilling tap	7.50
Bushings—1 from 1′ - ¾′; 1 from 1′ - ½′; 1 from 1′ - ¼′; 1 from 2′ - 1 ½′; 1 from 2′ - 1 ¼′; 1 from 2′ - 1′	2.00

TOOLS.

1 pair pipe tongs	$2.00
1 sledge hammer	1.00
1 pair scales, 800 lb	10 00
2 coal shovels	1.50
3 spoon "	3.75
2 picks	1.50
2 canthooks	2.50
2 14 ft. ladders	5.00
1 oak desk	25 00
1 pair pulley blocks, No. 5729	4.50
150 4-pin cross arms	45.00
1 brick hammer	.75
1 ladle	.40
2 digging bars	3.00
2 shovels, long handles	2.00
1 axe	1.25
1 hand axe	.75
1 coil flue cleaner	6.00
2 oil tanks	8.00
1 oil filter	15.00
1 set chain blocks	40.00
1 flue cleaning rod	3.00
1 Cardew voltmeter	60.00

TRANSFORMERS.

Three 150 Light, 110 volts.; One 90 Light, 50 volts.; No. 1025, Class 2 E, 52 V.; 11450, Class 1 E, 52 V.; 1702, Class 25, 52 V.; 1001, Class 40, 52 V.; 1375, Class 15, 52 V.; 1755, Class 15, 52 V.; 14255, Class 2 A, 52 V.; 2762, Class 15, 52 V.; 1323, Class 15, 52 V.; 17514, Class 1 E, 52 V.; 9874, Class 2 E, 52 V.; 15411 Class 8 E, 52 V.; 1355, Class 5 E, 52 V.; 1736, Class 25, 52 V.; 10,631, Class 2 E, 52 V.; 11135, Class 1 E, 52 V.; 1165, Class 25, 52 V.; 1283 Class 15, 52 V.; 1321, Class 15, 52 V.; 2141, Class 15, 52 V.; 7445, Class 1 E, 52 V.; 1083, Class 40, 52 V.; 487 Class 40, 52 V.; 1360, Class 1 E, 52 V.; 715 Class 40, 52 V.; 9542, Class 25, 52 V.; 1253, Class 15, 52 V.; 497, Class 15, 52 V.; 48141, Type F, 600 W.; 48829, Type F, 600 W.; 47980, Type F, 600 W.; 52694, Type F, 300 W.; 53367, Type F, 300 W.; 53375, Type F, 300 W.; 54134, Type F, 300 W.; 51890, Type F, 300 W.; 8 Type F, fuse cut-outs	$1,500.00

SUPPLIES.

Electroliers—Two No. 7244, 2 L.; one No. 7244, 3 L.; two No. 7265, 2 L.; one No. 7265, 3 L.; one No. 3614, 3 L.; one No. 3613, 2 L.; one No. 3607, 2 L.; one No. 7602, 2 L.; two No. 7357, 1 L.; one No. 7410, 1 L.; two No. 186, hall; one No. 113, hall	75.00
1 Bernstein series socket	1.25
Three 3 in. bells	2.25
1 hanger board and switch	6.00
1 dozen assorted tint shades	8.00
2 cells open circuit battery	2.00
2 cells gravity battery	4.00
1 cell Grenet battery	2.50
2 learner's sets telegraph instruments	11.50
1 Lee annunciator	8.00
2 push buttons	.40
1 Rumkof spark coil	7.50
4 Geisler tubes	9.00
1 motor for same	12.00
1 alternating fan motor	30.00
2 toy motors	20.00
Total	$19,364.75

Total brought forward	$19,364.75
48 cedar poles in yard	120.00
Gas Plant—1 Goodwin station meter, 1,000,000 cubic feet; two 5-light meters; one 20-light meter; three 14-light meters; sixteen 3-light meters; 1 test meter; 1 gas pressure gauge; 1 gas pressure governor; 1 photometer (Jones); 1 pocket pressure gauge; 3 retorts; 4 condensers.	
Gas Meters—Sixty-one 3 L.; three 5 L.; ten 10 L.; four 20 L.; one 40 L.	

WATTMETERS:

47, 10 Amp	$470.00

15 lbs. No. 1 K. K. wire	2.55
60 ft. No. 00 Undrs. wire	4.80
Total	$20,660.21

The property not valued was included in the gas plant, to which slight additions had been made, and for which Mr. Gilman had paid $20,000. It is therefore easy to arrive at the basis on which the $175,000 of securities rested:

Cost of gas plant	$20,000.00
Cost of electric plant as per schedule	20,660.21
	$40,660.21

It is not fair, however, to assume that the above was the *value* of the property. Just what the value was, or is, it is not easy to determine. Here was a company bonded for $75,000, with a floating debt of over $12,000, losing nearly $10,000 a year, in a town of 6,520 people, with no prospect of rapid growth (and which, as time has shown, has not grown materially); its property representing a possible investment of $40,000—we must leave the *actual valuation* to the promoters. There is, however, some evidence extant as to just what the present owner, Mr. Coffin, considers the property worth. In August last it was offered for sale at $10,000, and up to our last report had not been sold.

Further comment is unnecessary. The affairs of the Faribault Consolidated Gas and Electric Company have been made clear, and the story is on record as another link in the chain which binds Mr. Coffin to the gigantic swindling operations carried on under the name of the Northwest General Electric Company.

Next week we shall treat the Owatonna electric light plant.

ELECTRICITY.

At a recent meeting of the Western Railway Club, at Chicago, Mr. L. B. Stillwell delivered an address on "Electricity as a Motive Power for Surface Roads" which contains passages of a far higher style of thought and expression than is usually found in addresses of this kind. We subjoin an extract:

> Electricity never stretches, never breaks, weighs nothing, can be subdivided indefinitely with great ease, can turn corners without loss. It can transmit large amounts of energy at pressures easily controlled along wires of moderate size, and it never freezes. Its loss by friction is comparatively insignificant, and its other losses in comparison with every other known agent are almost negligible.
>
> It is interesting to note that in employing electricity we are using not a solid, not a liquid, not a gas, but ether—that mysterious something which as modern science teaches penetrates all matter and fills all space. We cannot accurately define electricity, but this much at least is known. Electricity has to do with the same medium that transmits light; it is as swift as light and as strong as steel; it weighs nothing, and yet if compressible at all it is certainly less compressible than any known material; let us say a push applied to one end of a circuit in Chicago is instantly felt at the other end in New York. We have within a few years come to recognize electricity as the nerve system of civilization. We are just beginning to realize that it is also muscle. We may hope that at no distant day great systems of electric conductors, noiseless, motionless, giving no sign of the work they are doing, radiating from central stations suitably located, will propel every car and train and every wheel of industry in our cities.
>
> Power can be far more economically developed in large quantities than in small, even where coal is the source from which it is derived and making all allowances for losses in transmission through conductors and conversions in motors. It is cheaper to-day, so far as the cost of power is concerned, to propel suburban trains by electric motors than by steam locomotives; and where a transmission system is adopted it becomes possible to utilize any cheap power which may be found within reasonable distances—say twenty-five, or even fifty, miles. It is entirely within the limits of the possibilities of electric traction as now developed to operate trains within the city limits of Chicago by power transmitted from the drainage canal near Joliet.
>
> In view of the facts to which I have briefly referred, we are, I think, justified in concluding that a broad view of the situation indicates that electric traction is destined to generally supersede all other systems of traction in our large cities and their suburbs. To what extent electric traction will, in time, compete with steam in cross-country service it is yet too early to say, but if I may be allowed to express my personal opinion, I should say that where distances are great and traffic comparatively light it will be a long time before steam locomotives are superseded. For the cities, however, the change cannot well come too soon. It is true that the best means of transmitting power from the central station to the moving car has not been conclusively fixed upon. The overhead trolley, the conduit, and the systems in which contact points under the moving car are charged as the car passes and discharged when the car has passed—these, and perhaps others, are to-day in practical operation, and in no small degree successful, but they have not been in use for a sufficient length of time to make it clear that any one is superior to its competitor—in fact, it is altogether probable that here, as well as elsewhere, we shall find that no one system is best for all cases; that various methods must be employed to meet different conditions.

THE MONTREAL MEETING.

There are two desirable routes for Eastern delegates to choose from in going to the Montreal meeting of the American Street Railway Association. The sessions open on Tuesday, October 15 next, and the first train, made up chiefly of the Pennsylvania contingent, leaves New York on Monday morning the 14th, going over the New York Central to Albany, thence over the Delaware and Hudson along the western shore of Lake Champlain for its entire length, and reaching Montreal at 9:30 P. M.

The second train leaves the Grand Central Depot Monday evening, and passengers will arrive at Montreal early Tuesday morning.

Accommodations on the first train can be secured through Mr. William Hulings, care of the J. G. Brill Company, Philadelphia, and on the second train through M. C. Roach, 413 Broadway, New York.

OUTING for October is a readable and finely illustrated number. The contents are as follows: "A Bit of Blue Ribbon," by Sara Beaumont Kennedy; "Rugged Labrador," by R. G. Taber; "Boar Hunting in the Ardennes;" "Banana Land Awheel," by E. M. Aaron: ,,Hero," by Therese G. Randall; "'Neath Cloudless Skies," by Fred. C. Green; "A Sporting Vacation in Montana," by G. M. Dillard; "Moose Hunting in New Brunswick," by the late E. P. Rogers; "Lenz's World Tour Awheel;" "Finnish Fish and Fishermen," by Fred. Whishaw; "Guns and Shooting," by Ed. W. Sandys; "The Great Dismal Swamp," by Alex. Hunter: "The New Hampshire National Guard," by Geo. H. Moses; "Football," by Walter Camp, and the usual editorials, poems, records, etc. The merry sports of Autumn live again in OUTING's pleasant pages. The frontispiece shows the sportsman upon our broad prairies. This cut illustrates G. M. Dillard's account of a Sporting Vacation in Montana. A very striking full-page portrays a bull moose in the act of calling.

STORAGE BATTERIES.*

BY H. A. EARLE.

When I undertook to read a paper before this Association, I hoped that I might have been able to treat the subject in a more exhaustive manner; the time at my disposal has, however, been limited, and the subject is one of such magnitude, and the results under different conditions of tests so numerous, that *I have* found it impossible to do more than give a general outline from a practical point of view.

It is interesting to trace the history of storage battery manufacture, and, by so doing, each step in the advance up to the present time can best be considered.

The discovery of secondary current dates back to 1801, when Gautherot found that silver or platinum wires, which had been used to decompose a saline solution, were capable of giving a reverse current of short duration. Ritter, in 1803, was, however, the first to make a secondary battery, in which he employed plates of gold separated by cloth or paper, the same being moistened with a saline solution; he experimented with various metals, including lead, but the secondary currents obtained were of short duration, and the batteries only of scientific interest. It appears, at first sight, strange that Ritter, when using lead, obtained no increased effects, this being the metal exclusively employed at this time; he, however, used salt water, and this formed chloride of lead scarcely soluble, and a very bad conductor; on this account the current was very weak in comparison with that which would have been obtained if water acidulated with sulphuric acid had been used.

Since that time many scientists have investigated the subject, and De la Rive, in 1826, obtained secondary currents from platinum plates in a voltameter filled with water and sulphuric acid, and he closely approached the elements of our present storage battery, when, among his many experiments he used in a primary battery a platinum plate covered with a film of peroxide of lead, and a zinc plate, immersed in an acid solution.

The first powerful storage battery was introduced in 1860, when Planté constructed cells composed of lead plates immersed in an acid solution of 1.068 specific gravity (10 per cent. acid); these were a success, with the exception that the method employed for their formation, namely, frequent charges, discharges, reversals of charge, and periods of rest, was too long and expensive for practical purposes, several months being necessary to obtain a useful capacity.

The subsequent rapid development and improvements in electrical machinery and lamps created a real demand for a good storage battery, and turned the thoughts of many to the subject, and the next, and one of the most important of subsequent improvements, was that introduced by Faure, in 1881, namely, of pasting a coating of lead oxide on the surface of the plates, which rendered them, after a comparatively short formation, ready for use. The Faure cell was never, however, as originally designed, a practical success, for though the active material was encased in a covering of flannel or felt, the pasted coatings being on upright surfaces, and having insufficient adherence, came away within a period not sufficiently long to give economical results. Swan realized that the active material required a better mechanical support, and introduced a plate of grid form, the interstices serving to retain the material; this frame, combined with the Faure pasting, was the origin of the plate that has been largely used in this country and elsewhere.

Up to the date of the expiration of the Swan and Faure patents, the manufacture of pasted plates in this country was in the hands of one company and its licensees, and competition was thereby to a great extent absent; this is, however, more likely to have been an advantage than otherwise, for much has meanwhile been done to perfect and cheapen the production of the solid lead plates, and these are making such strides forward that it seems probable they will eventually outstrip and replace their pasted rivals. Solid plates have been made of various types, and some have been pasted to avoid the expense of formation, the paste in this case serving to give the required capacity till the action of charging and discharging gradually attacked the solid surface; improved methods, have, however, been discovered for effecting rapid formation at a reasonable cost, and although pasting is now open to all, in all probability there will be little extension of its use, unless means are devised for the better retention of the material.

Another type which differs greatly from the solid lead plate, but which is not pasted, is the chloride plate; in this case the material, to become active, is a mixture of chloride of lead and chloride of zinc, which is cast into small tablets, these being framed by casting antimonious lead around them under high pressure, the subsequent elimination of the chlorine and zinc leaves a porous structure of pure lead, of a crystalline nature, good conductivity, and with a large surface exposed to the electrolyte, the result being a large capacity for a given weight and for the space occupied.

The mere manufacture of an accumulator, with lead and sulphuric acid, is a simple matter; but when combined with the necessary requirements of low first cost for a given capacity, and long life, it presents more difficulties than is generally supposed. Omitting the question of cost, the chief points to be considered are the *chemical action*, the *mechanical construction*, and the proper *treatment* of the cells when made. In lead batteries the minimum weight is limited by the chemical requirements, the theoretical value of lead peroxide is 4.44 grammes per ampere hour, or roughly, 1 lb. is the equivalent of 100 ampere hours; presuming that the positive and negative plates were identical, the value would be approximately 50 ampere-hours for 1 lb. of peroxide and spongy lead. As a matter of fact, the highest capacity plates yield only about 7 ampere-hours per pound of positive and negative plates, or 16 ampere-hours per pound of peroxide and spongy lead, due to the facts that a conducting frame of considerable weight has to be employed, and to the impossibility in practical working of reducing the whole of the peroxide. To obtain the best results for a given weight, the frame must be reduced to a minimum consistent with the necessary strength and conductivity, and the distribution of the peroxide must be such as to admit of the perfect circulation of the electrolyte and its penetration throughout the mass.

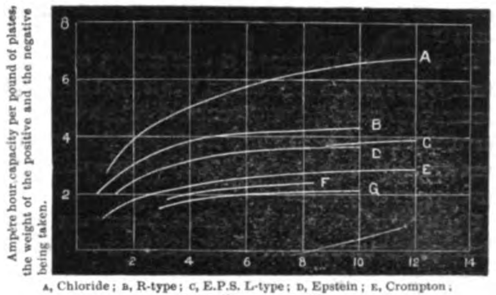
When the active material is retained in holes or interstices, due provision must be made for its expansion on oxidation; for the power exerted is so great that it will bend or burst a frame which holds it too tightly; various methods have been adopted to prevent buckling, but it is still a source of trouble with perforated pasted plates; solid grooved or ribbed plates, however, the grooves on which are filled with paste, are not subject to the same extent to this fault; solid plates on which the active material is formed out of the substance of the plate itself are practically free from it.

In the chloride plate ample provision is made for this increase in volume by the elimination of the chlorine and zinc, which renders the structure porous and cellular.

Nothing is more interesting than the behavior of cells under various conditions, and from the innumerable curves that can be plotted we can readily study the effects due to different rates of charge and discharge, to the penetration and strength of the electrolyte, and to the ratio of the positive and negative plates; from these and many other similar tests, much useful information can be obtained for guidance both in manufacture and treatment. There is a given rate of charge for every type of cell which is most suitable, not only for its efficiency, but also for its durability; with some types a high rate is quite inadmissible, and a period of ten hours is required; other types, however, are of such a construction that they may be fully charged in four hours without detriment; this variation is mainly due to the disposition of the active material, to its thickness, and to the method of its production, namely, whether it has been mechanically applied or electrolytically produced. Most of the effects of varying rates of charge can be ascertained from the resultant discharge, but discharge curves have, nevertheless, characteristics of their own which are, to a great extent, unconnected with the conditions of charge, and they depend upon the type of plate, strength of acid, the rate of discharge, and other influences.

A series of curves is exhibited (Fig. 1), and these give at a glance results obtained with plates of various manufacture. In every instance the weight of one positive and one negative has been taken; knowledge of the ratio of weight of active material to frame is naturally necessary for the complete investigation of these curves, but in this case the weight of the plates themselves has only been taken into consideration, as it is merely intended to show results obtained from various types of plates at present manufactured.

Curve A is taken from plates, the active material on which is of a very porous and cellular nature, of $\frac{5}{16}$ths of an inch thick. It will be noticed that the capacity per pound of plate continues to rise up to the 12-hour rate, and that at that point it is still slightly on the increase. This increase is no doubt partly due to the gradual penetration of the acid, and partly to the rapid sulphation of the surface at the higher rates.



A, Chloride; B, R-type; C, E.P.S. L-type; D, Epstein; E, Crompton; F, E.P.S. K-type; G, Tudor.
Duration of discharge in hours.

FIG. 1.

Curve B is that given by a positive plate, the active material on which is distributed in a thin layer over a very large surface, the negatives being the same as employed for curve A. This plate gives less ampere-hours per pound of plate, owing to its possessing a heavy frame, but per pound of peroxide of lead its yield is greater: the active material in this plate is not formed out of the substance of the frame, but is entirely independent of it. A plate of this description, in which the whole face of the active material is directly exposed to the electrolyte, is capable of giving its maximum capacity at a comparatively high rate of discharge. A thin layer of peroxide spread over a large surface reduces the clogging of the surfaces to a minimum, and a free circulation of the electrolyte admits of fresh acid of the proper specific gravity being continually available.

Curve C is obtained from a pasted plate suitable for slow rates of discharge, and from its rise in capacity at reduced rates we notice somewhat similar characteristics to that in curve A.

There is, however, a remarkable point of difference between curves A and C, for the plates in each instance contain approximately 30 per cent. by weight of active material; curve A, therefore, gives us about double the ampere-hour yield per pound of active material over curve C, and this is obtained by the cellular and porous structure of the material in the A curve plate.

Curve D is taken from plates cast with ribs on their surfaces, the active material being formed out of the substance of the plates themselves. The curve is very similar to B, but falls lower on the scale, this being caused by the weight of the positive plate, its thickness being considerable in order to give a reserve of metal, which in its turn is acted upon as the plate gradually disintegrates.

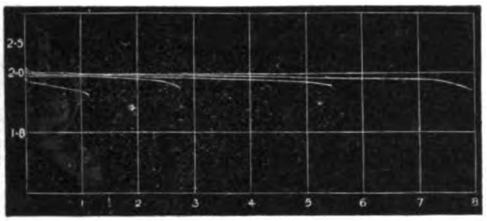
---

* Paper read before the British Association at the meeting September 11-17, 1895.

Curve E is given by plates, the surfaces and interior being full of blowholes, which gives a large exposed area; their weight for a given output is, however, large.

Curve F is a pasted plate with a solid frame, which gives a poor return for its weight; in this curve we notice the rise in capacity at reduced rates due to pasted plates.

Curve G gives the capabilities of very heavy plates which are pasted on their surfaces, the paste being intended merely to give the required capacity till its disintegration, by which time the frame itself has been sufficiently formed to do the work; the rapid flattening of this curve indicates that the layer of paste is thin.



Duration of discharge in hours.

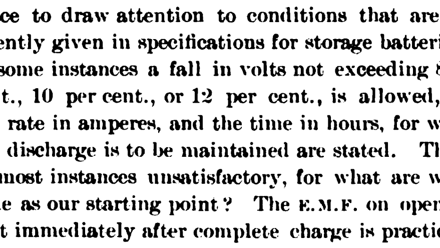
FIG. 2.

The curve of voltage of a discharging cell varies greatly, and is dependent upon the rate of discharge, the strength of acid, the distance of plates apart, its curve of internal resistance, and the treatment it has been subjected to beforehand, besides many other interesting conditions.

Fig. 2 demonstrates the effect of varying rates. These curves have all been obtained from cells of the same type, the acid having been approximately 1.210 specific gravity when the cell was fully charged.

Discharges of varying rates are given, namely, 1 hour, 2½, 3½, 5½, and 7½ hours, and though slightly different results would be obtained with other types of cells, they may be taken as a fair approximation for general reference.

When considering the question of fall in volts on discharges at different rates, it will not be out of place to draw attention to conditions that are frequently given in specifications for storage batteries—in some instances a fall in volts not exceeding 8 per cent., 10 per cent., or 12 per cent., is allowed, and the rate in amperes, and the time in hours, for which the discharge is to be maintained are stated. This is in most instances unsatisfactory, for what are we to take as our starting point? The E.M.F. on open circuit immediately after complete charge is practically a fixed value, with a given type of cell and a known strength of acid. But the fall in the first few minutes varies greatly according to the rates of discharge, and at high rates it may fall as much as 10 per cent. in a few minutes or even seconds, before a comparatively straight line has been reached, and the cell is working at its normal voltage for the specified rate of discharge; this is quite clear by reference to Fig. 2. Another point to which our attention is drawn is the fall of voltage on open circuit after the completion of charge. A series of curves (Fig. 3) are exhibited, showing the fall in voltage for a period of 21 hours, each curve being for a different strength of acid; it is therefore evident that if a given percentage of fall is allowed, it will be most advantageous for the manufacturer, but not for the purchaser, to allow the battery to stand for a few hours in order that this useless high voltage be reduced. The best way to meet this point is, however, to take the first reading of voltage five or ten minutes after the discharge has commenced. In other specifications the voltage is fixed to a hundredth of a volt, and the cell must give the specified capacity above this limit in many instances, and especially when high discharge rates are specified. The voltage given is much too high on the curve, and in some instances I have found it actually fall on a straight portion of the same, so that the time at which this point is passed raises an unpleasant difference of opinion between the buyer and the seller. This class of specification generally necessitates a very much larger battery than was intended, with corresponding increased cost, and should the manufacturer not have been exceedingly careful in preparing his estimate, he may find that the buyer is not satisfied with a good excess of ampere-hours, but will have his volts as well, even if this means 50 per cent. in ampere hours in excess of what he thought he was ordering.



Interval in hours after completion of discharge.

FIG. 3.

(*To be continued.*)

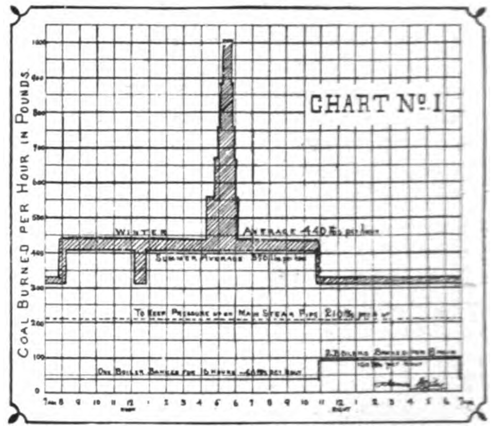
FROM THE COAL PILE TO THE METER.*

BY JAMES MILNE.

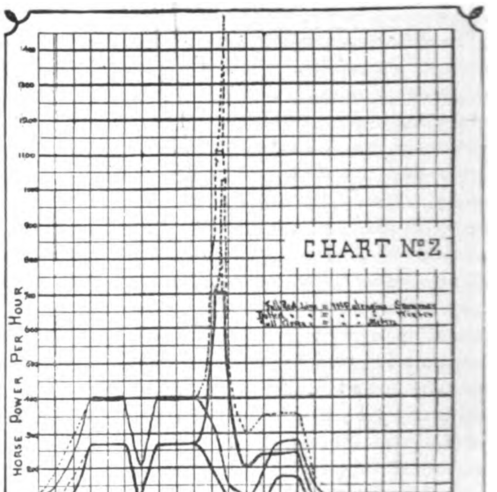
We see so many curves these days showing the high efficiency of this and the very high efficiency of that, and so on, that we are apt to think there is little room for improvement. My intention is therefore to trace from the coal pile to the meter on the consumer's premises, and endeavor to show by means of diagrams, calculated from different sources, the condition of affairs in light and power plants and to see if there is not something that could be improved on.

Chart 1 illustrates at a glance the following: First, the amount of coal required to keep up the pressure at the boilers without delivering any to the main steam pipe. It will be seen that for 16 hours 40 lbs. are consumed and for 8 hours it takes 100 lbs per hour. Second, the amount of coal required to keep the pressure up when steam is turned on the main pipe, which is equal to 210 lbs. hourly. Third, the amount of coal required to keep the steam pressure up for running the average friction load in summer. In this load I have included the power required to run the generators and charge the fields, but not supplying any current to the external circuit. Beginning at 11 P. M. we find the average friction load takes 310 lbs. per hour up to 8:15 A. M.; after that it rises to 420 lbs. and continues at this until noon. It then decreases until 12:30, and again rises, and at 1:15 it is 420 lbs. and remains at this until 11 P. M. Fourth, the amount of coal used for the average friction load in the winter time. It will be observed that for the same load there is a slight increase in the coal consumption owing to increased radiation, condensation, etc.

We are now ready to supply current to the external circuit, and Chart 2 illustrates the power indicated as the engine for 24 hours' run, summer and winter. The full red line shows the I H. P. at the engine in the summer, the dotted red line the I H.P. in the winter, and the full and dotted green lines the I H. P. available at the service or when the wires enter the consumer's premises. You will observe as the H. P. increases the distance between the red and green lines also increases. This is accounted for by the decrease in the efficiency of the external circuit and also the increase of the friction load, and you will readily understand that when the load is at its lowest the distance between these lines will be a minimum and the only time they would coincide would be when the plant is shut down. The peak in the winter time is always an interesting figure to those in the business and no doubt deserves a word or two, for it is generally about this time that a few words are said in the power house, but whether they be good or bad I will leave that for yourselves to conjecture. I thought of plotting this peak 50 % higher, but the data I have was not very reliable, so I concluded it was better to leave off at the point where it might be misleading. According to our diagram it is plotted for 1,200 H. P. at the engines, and we find by looking at the green line 700 H. P. is being registered at the meters, which means that by deducting the correct amount for friction, losses in generators, etc., we find a loss of 25 % in the line, or in other words we get at this time an efficiency of 75 % between switchboard and meters. It may seem to you, or some of you at least, that this is an enormous loss and steps should be taken to reduce it. When everything is taken into account I think we will find it cheaper to put up with this loss than try to overcome it. It (the loss) is only for 60 days a year, etc., for one hour per day, making a total of 60 hours per annum. Now if copper were put in to reduce it we know that interest, depreciation, etc., runs on continually, and would in some cases more than offset the amount spent for the extra coal consumed during this loss. It would be an easy matter to calculate the amount spent on coal to make up this loss and see how much copper it would be equivalent to, even taking the whole amount as interest on the investment.



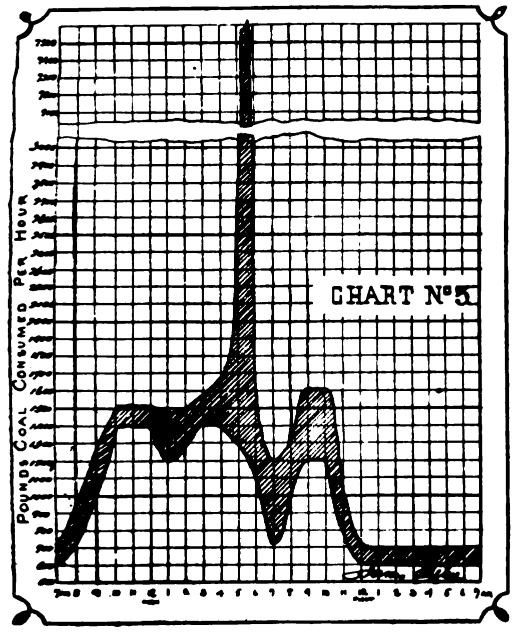
On diagram 1 we showed the coal consumption per hour necessary to keep up the steam pressure to run the engines and generate current up to the switchboard. We now come to Chart 3, which shows the amount consumed when running as indicated on Chart 2. The part in section shows the increase for the winter load, and in this we have again an interesting diagram which, when calculated out, shows very clearly the effects of forcing boilers. By comparing the run made between 10 A. M. and 12 noon and that made between 5 and 6 P. M., in the winter time, we find there is an increase of 75 % in the amount of coal burned per horse-power per hour, which certainly shows that forcing boilers is far from being economical. Diagram 4 shows the amount of coal consumed per square foot of grate surface. Be-



---

* Paper read before the Canadian Electrical Association.

ginning at 11 P. M. we have 22 lbs. This continues up to 7 A. M. when a change over is made which re*duces* the amount to 9 lbs. for a short time. It then gradually increases until 10 A. M. when we get a fraction over 17 lbs. At 12 noon it diminishes to 15, and we again find at 3 P. M. it is the same as from 10 to 12, viz., 17 lbs. From 3 to 5 it averages 16 lbs., *and at 6* it has reached 9 lbs. From 7 to 9 it increases from 9 to 15 lbs., and continues at 15 lbs. for 1½ hours. The part in sections, as in the other diagrams, shows the difference between the summer and the winter loads. The two peaks show the amount burned per foot of grate service on two different sets of boilers. On one it will be seen that 43 lbs. per foot are consumed and 32 lbs. on the other, and to my mind shows that they are going for all they are worth.



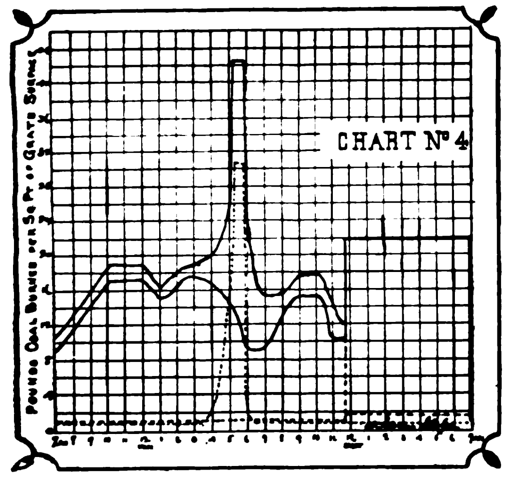
In calculating the amount of coal consumed per foot of heating surface I find at the most economical load .322 lb. is burned, and the most uneconomical load, between 5 and 6 P. M. in the winter, it is as high as .9 lb. per square foot.

Let us now see what economy we are getting from the boilers.

Summer:

Total water evaporated for 24 hours = 201,600 lbs.

$\frac{201.600}{25,000} = 8.07$ lbs. water evaporated from temperature of feed or 210, which is equivalent to 8.32 lbs. from and at 212° per lb coal. Allowing 10 % ash, which is not excessive and compares favorably with the average of the data I have received from different plants, we get 8.97 from temperature of feed or 9.24 lbs. from and at 212° per lb combustible.



Winter:

Total water evaporated per 24 hours = 276,343 lbs.

$\frac{276,343}{36,000} = 7.5$ lbs. from temperature of feed or 200°, which is equivalent to 7.9 from and at 212°, and allowing the same percentage of ash we get 8.34 lbs. from 200° and 8.78 lbs. from and at 212° per lb. combustible.

In the summer time we have stated that an evaporation of 8.32 lbs. per lb. of coal is obtained, and taking the coal at 12875 B. T. U. we get a theoretical evaporation of 13.32 lbs. water per lb. of coal from and at 212°. This agrees fairly well with any of the tables giving the thermal units of heat of the grade of coal burned.

Theoretical evaporation = 13.32 lbs.; actual evaporation = 8.32.

Efficiency therefore is = 62.47 %, or say 62.50.

We are all more or less acquainted with the first law in thermodynamics, which may be stated thus: Heat and mechanical energy are mutually convertible, a unit of heat corresponding to a certain fixed amount of work called the mechanical equivalent of heat. We can calculate the mechanical equivalent of the coal pile thus:

$$\frac{12,875 \times 772 \times 25,000}{24 \times 60 \times 3300} = 5229 \text{ H. P.}$$

$\therefore$ 5229 × .6247 = 3266.5 H. P. available at the stop valves of the boilers, which, if all were utilized, would give us 3.1 H. P. per lb. of coal per hour, or a little over .31 lb. coal per H. P. per hour, a result which with the greatest refinement in engineering has not yet been attained in practice, and I think I am safe in saying never will.

We will now calculate the efficiency of the steam

Average steam pressure, 125 lbs. absolute.
Average exhaust pressure, 20 lbs. "
Water per H. P. per hour, 28 lbs.
Temperature of feed, 210° Fah. (summer).
Temperature of water before entering heater, 40°.
125 lbs. abs. = 1187 units. Feed water raised from 40° to 210° = 170° by heater.
$\therefore$ 1187 — 170 = 1017 thermal units of heat expected per pound of steam.

Thermal units per 1 H.P. per min. $= \frac{1017 \times 28}{60} = 474.$

$\therefore \frac{42.75}{474} = .09$ or 9 % efficiency.

Taking the temperature of the feed at 210 and that of the steam at 344°, we get

$\frac{344 - 210}{805} = .168$, or an efficiency of 16.8 %,

if same were a perfect engine working between the limits of the temperatures 344° and 210°. Therefore the relative efficiency between the perfect engine and the above is

$$\frac{.09}{.168} = 53 \%.$$

By the above reasoning we get an efficiency or 9 %: of the total power available at stop valves of boilers:

$$3266.5 \times .09 = 293.98 \text{ H. P.}$$

Our actual H. P is 230 or 78.23 % of 293.98.

$\therefore$ .9 × .7823 = .070407, or a fraction over 7 %, representing the efficiency of engine to boiler, and calculating to coal pile we get an efficiency of .625 × .09 × .7823 = .625 × .070407 = .044, or a net efficiency of 4.4 %.

We also find from actual results that a mechanical efficiency of 82.3 % is obtained from the engines; that is to say, it takes 17.7 % to overcome friction and run generators up to speed.

Therefore the power available for running the generators is 230 × .823 = 189.29 H. P.

Efficiency of generators not less than 92 %.

$\therefore$ 189.29 × .92 = 174.14 H. P., available for sending out to the line, and from boiler to switchboard we have

$$.09 \times .7823 \times .823 \times .92 = .0533,$$

or briefly, $\frac{174.14}{3266} = .0533$, or 5⅓ % efficiency,

and going back to coal pile we get .0533 × .1247 = .0333 or 3⅓ % efficiency.

We have got one more item to take into consideration to complete our calculations, and that is the efficiency of the external circuit, which is in the summer time 85 %. Therefore the total H. P. available at the meter on the premises of the consumer is 174.14 × .85 = 147 H. P. fully, or more accurately

$$3266 \times .09 \times .7823 \times .823 \times .92 \times .85 = 148 \text{ H. P.}$$

The net efficiency from boiler to meter is

$$\frac{148}{3266} = .0453 \text{ or } 4.53 \%,$$

and from coal pile to meter we get .0453 × .6248 = .0283 or 2.83 %.

From the above we get the following results:

Power for running generators	100
Power available at switchboard	92
Power available at meter	78.20

Efficiency of the electrical apparatus, including outside circuit = 78 1-5 %.

Engine	100
Available for generating current	83.3
Available at switchboard	75.72
Available at meter	64.35

The commercial efficiency from engine to meter is 64.35 %.

Boiler equivalent	100
Indicated H. P. at engines	7.04
Available for generating current	5.79
Available at switchboard	5.33
Available at meters	4.53

The efficiency therefore from the boilers to the meter is 4.53 %.

Coal pile equivalent	100
Available at stop valves of boiler	62.47
Indicated H. P. at engine	4.4
Available for generating current	3.62
Available at switchboard	3.33
Available at meter	2.83

The above extended results apply, as has already been stated, to the summer load, but as the results from the winter load are practically the same, I need not take up your time going over them.

We see, therefore, that the electrical end shows up exceedingly well. For every 100 H. P. at the engine, 82.3 is utilized for generating current, and 75.77 of this is sent out to the line, which, although it could be improved on, leaves very little to be gained by any new invention or alteration that may hereafter be made.

Regarding the steam end, there can be no doubt that considerable attention has been paid to it, and it is still receiving more. Yet it does not alter the fact that it is here where we get the worst showing. When some of the great scientists arrive at the method of abstracting electricity direct from the coal pit or even the boiler without the intervention of the steam engine, better results may be obtained.

I see in some of the engineering papers that evaporation condensers are coming into use and are being applied to plants that have heretofore been running non-condensing. This is a step in the right direction, and as no more water is used than that required for steam purposes, parties at present having to pay for their water might find this a profitable investment, inasmuch as a vacuum of from 22″ to 26″ is readily obtained—in fact, guaranteed by the builders.

Married.

Mr. William Eugene Keily, who was the last of the editorial staff of the *Western Electrician* to succumb, capitulated on Thursday, September 26, to Miss Catharine Meagher.

First it was Mr. Kreidler himself, next it was Mr. O'Hara, only a few weeks ago it was Mr. Perry, and now Mr. Keily. The infection seems to have been strong in that office and only died out when there ceased to be material for it to feed upon. But the *Western Electrician* is a better paper and its editors better men for the inoculation, and as we have heartily congratulated each successive renunciator of celibacy and wished him and his fair bride a happy future, so do we now, no less sincerely, congratulate Mr. and Mrs. Keily and wish them God speed.

The marriage was announced on September 18 of Mr. W. G. Whilden and Miss Marie L. Ryder at 200 St. Mark's Place, Brooklyn. Miss Ryder had been for nearly six years private secretary to Mr. J. P. Ord, vice-president of the General Electric Company, and had made many friends. Among the wedding presents was an oxidized silver tea strainer, sent by Mr. Ord.

HOW THE ELECTROPOISE WAS FIRST MADE.

To the Editor of ELECTRICITY.

DEAR SIR: The predictions of Mr. Brush in your issue of the 18th inst. will certainly come true if you continue in the good work, and, as he says, you deserve it.

Your article on the Bell Company and the opposition in the last edition is timely and to the point—just such articles as all fair-minded, honorable people like to read. Follow it up with others of like nature and the general public will commend you and patronize your paper.

I am glad to note that you are ventilating that great fraud the Electropoise. I know something about that instrument. The company was first organized at Birmingham, Ala., and about the first city they attempted to do business in was Memphis. I was called upon to put up the first machine, which, by the way, was quite different from those now being used. The mysterious little cylinder was placed underground about 18 inches at some convenient place, from which a wire was run to a box placed in the patient's room. This box resembled somewhat a telephone. From the box flexible cords extended to the patient. On the box there was a dial with a hand and about twelve contact points. On these contact points were engraved names of diseases the instrument was supposed to cure.

While putting up the instrument I had an opportunity to look into the box and found, to my surprise, that one of the wires from the patient ran to all the contact points, and was so arranged that in moving the hand from one contact to another you added about 2 inches of No. 18 copper wire to the circuit, if there was a circuit, at each move..

I was also called to refill some of the cylinders, and having a quantity of the contents of old Laclanche battery porous cups, showed it to the agent and he pronounced it just the material required, and the cylinders were filled with it and seemed to cure (?) just the same as the others did. Yours truly,

JAS. D. RANDALL.

Memphis, Tenn., Sept. 23.

To Remove the Assignee of the La Roche Company.

Counsel for Harry S. Smith, the Ball Engine Company, J. W. Parker & Co., J. G. Gray, assignee for Queen & Co.; John McCullough. Merchant & Co., McCalvey Elevator Works and others have begun equity proceedings against J. Franklin Stevens, assignee of the La Roche Electric Works, asking the Court to discharge the respondent as assignee; that other appraisers be appointed who shall not be officers of the assigned estate, and that an accounting be made of all the property belonging to the assigned estate.

The bill sets forth among other serious charges that on July 15, 1895, the Ideal Electrical Company was incorporated by James Collins Jones, who is attorney for the La Roche Electric Works and also for F. A. La Roche & Co.; J. Franklin Stevens, assignee for the La Roche Electric Company, and George F. Louty, who is at present and who has been since the assignment in charge of La Roche & Co., doing business in the building of the assigned estate; George A. Colgate, of the firm of George A. Colgate Co., of New York City, which represents the Keystone Electrical Instrument Company, and James D. McIntosh and William G. Toylis, and that this last named company is at present occupying the building of the assigned estate without charges for rent or uses of machinery, and the creditors' rights and privileges are displaced; also that it is the full intention of the assignee to sell all the property and assets of the assigned estate at the appraised value or less to the Ideal Electrical Company, in which he holds a great financial interest, thus involving an enormous loss to the creditors individually as well as to the assigned estate generally.

The complainants state that an inventoried value of the property of the assigned estate as filed and stated by the assignee is $147,836.85 and the value of the property as appraised by the assignee and by the appraiser appointed by the Court is $25,711.10.

The Welsbach Light Company.

Edward C. Lee, treasurer of the Welsbach Light Company of Philadelphia, tells the *Boston News Bureau* that the company is now paying dividends at the rate of 80 per cent. per annum, and is earning a very satisfactory surplus above that.

The output of the company at the present time is at the rate of 2,500,000 lights annually, but the manufacturing facilities of the company have been enlarged to an annual capacity of 5,000,000 lights.

The Welsbach Light Company was a consolidation of three companies, and the capitalization was scaled from $19,000,000 to $525,125, divided into 105,025 shares, par $5. Of this capital $515,806 has been issued. It is now proposed to increase the capitalization to $10,000,000, par $100.

The company's dividend record is as follows:

June, 1893 (first dividend)	2	per cent.	$10,316
June, 1894	4	"	20,632
September, 1894	4	"	20,632
December, 1894	8	"	41,264
March, 1895	10	"	51,580
July, 1895	20	"	103,161
September, 1895	20	"	103,161
Total			350,746

The stock of the company is now quoted at 92; it sold as low as 39 in March of this year.

An Electrical Headquarters.

A movement is on foot to arrange for an electrical headquarters at the New Manhattan Athletic Club in this city. At the formal fall opening of the club on Monday evening, Sept. 23, quite a number of electrical men were present and the idea met with general approval. The dues of the club are $36 per annum, or for non-resident members $18. The clubhouse, as is well known, is one of the finest in the country. The scheme would have many advantages over any attempt to run a distinctly electrical club. Among those who were present at the opening meeting referred to were the following:

Fred'k A. Scheffler, Jas. B. Olson, G. A. Prendergast, Edgar A. Dunham, F. W. Harrington, W. J. Morrison, David Chalmers, Elmer P. Morris, Frank B. Rae, Harry Alexander, S. Davis, R. A. Stacpoole, Geo. F. Porter, E. F. Peck, John F. Outwater, S. A. Douglas, A. Alexander, C. E. Nooney, Clarence Kelley, W. Sharland, J. H. Sharland, E. A. Record, A. C. Shaw, B. E. Greene, Joseph Crowell.

To Reorganize the Detroit Electrical Works.

A new reorganization committee has been appointed for the above company, and L. Warfield and W. A. Jackson, trustees, have issued a circular to certificate holders, presenting the following statement of assets and liabilities:

Assets.

Plant, including machinery, drawings, patterns, and fixtures	$95,232
Material in stock	17,584
Cash on hand	475
Current accounts and notes	10,049
Stocks and bonds, par value	70,800
Suspense account	2,009
Accounts and notes	207,498
Total	403,647

Liabilities.

Accounts and notes payable	$28,998
Four notes Atlanta City Street Railway Co *	17,499
Interest and fees to August 31*	1,424
Electric Supply Co.†	4,471
Buffalo Forge Co. (heater contract not filled)†	3,600

* Contingent liabilities to Hugh McMillan.

† Disputed liabilities in suit.

In addition to the above assets there are suits growing out of unfilled contracts in which is claimed $60,975, and suits against W. A. Boland and F. A. Barnaby for $750,000 damages, and $593 accounts garnisheed at time of mortgage.

Horn & Brannen Manufacturing Co. Burned Out.

The extensive gas and electrical fixture manufactory of the Horn & Brannen Company, Philadelphia, one of the largest in the country, was almost totally destroyed by fire on Wednesday night, Oct. 2, causing a loss estimated at between $130,000 and $140,000. The fire originated in the basement at the foot of an elevator shaft running through the building. Fourteen men and two women were working in the building when the fire broke out, but all escaped safely. Insurance almost covers the loss, the closest estimate being that it amounts to $110,000, distributed between thirty or forty companies. Two hundred hands will be temporarily thrown out of work, but only for a short time, it being the expressed intention of the firm to rebuild immediately.

Municipal Lighting.

The question of municipal control of electric lighting plants will, no doubt, receive considerable attention at the next meeting of the American Society of Municipal Improvements, to be held in Chicago next year. At the last annual meeting, held last month in Cincinnati, the number of standing committees of the Society was increased, among the additions being a Committee on Electric Lighting. J. A. Cabot, city electrician of Cincinnati, was made chairman of the committee. His associates are Harold P. Brown, Newark, N. J., and F. W. Cappellen, Minneapolis, Minn.

LEGAL NOTES.

A bill for a receiver and for the foreclosure of a mortgage against the Ottawa, Ill., Electric Railroad has been filed by the Mercantile Trust Company of New York. The mortgage was given to secure $75,000 worth of bonds issued July, 1889. The court is asked to decree that the local creditors who have attached rolling stock and buildings on claims be compelled to stand aside in favor of the mortgagor, as the mortgage was recorded long before the road became indebted to others.

The General Electric Company has filed a bill in the United States Circuit Court for the District of South Carolina against all of the stockholders of the Charleston Light and Power Company. This proceeding aims to enforce the 5 per cent. liability, which under the laws of the State can be collected from the stockholders of an insolvent corporation. (A receiver has been appointed for the company on an action brought by the Atlantic Trust Company of New York.)

In the United States Circuit Court at Hartford, Judge Shipman has passed a final decree in the case of the Edison Electric Light Company against the Bryant Electric Company in a suit on infringement of an electrical patent. The Judge grants an injunction and an accounting.

Judge Townsend, in the United States District Court at New Haven, on the 1st inst., in the suit of the Westinghouse Company and Nikola Tesla against the Thomson-Houston Electric Company, granted an extension of time of forty days to the defendants, whose counsel claimed that they did not have time enough to prepare their case. The parties in the suit have been engaged in taking evidence for about a year, and the time of the defendants for this work expired October 7.

PERSONAL.

Mr. W. B. Vanzwoll has taken an active interest in the Sunbeam Incandescent Lamp Company, Chicago, and has been elected secretary. Mr. F. S. Terry, who formerly held that office, has been made vice-president.

GENERAL NEWS.

What is Going on in the Electrical World.

Bronson, Mich.—At the recent special election the people voted three to one in favor of having electric lights.

Clay City, Ind.—A fire here has destroyed the power house of the Clay City Electric Light Company; the machinery was ruined.

Montclair, N. J.—The Montclair Electric Light and Power Company has applied for a franchise to supply electric lights in Montclair.

Santa Barbara, Cal.—The Santa Barbara Consolidated Electric Company has been awarded the electric street railway franchise lately advertised for sale.

Bordentown, N. J.—The Bordentown Electric Light and Motor Company has been granted a franchise for the erection of an electric light plant in this city.

Dublin, Ga.—The aldermen have employed B. M. Hall, C. E., to make a survey and furnish estimates of the cost of providing this town with electric lights and waterworks.

Catskill, N. Y.—An electric road will be built from Catskill to Windham by a company incorporated under the title of the Catskill, Cairo and Windham Street Railway Company.

Jacksonville, Fla.—There is talk here of building an electric road to Panama Park to accommodote visitors to the grounds which the Jacksonville wheelmen intend to lay out there.

Harrison, Mich.—The township board has granted a franchise to John P. Martz to run an electric road from the foot of the Lakeside boulevard to the North Erie line on the lake shore.

Omaha, Neb.—The city electrician has been directed to prepare plans and estimates for an electric plant to light the city hall, run its elevators and light the public library and an engine house.

Williamsport, Pa.—The trolley line between Sunbury and Selinsgrove has reached a point where it is likely to become a reality. The company is making an effort to secure the right of way.

Oil City, Pa.—A charter has been granted to the Oil City Station Railroad Company, John B. Smith as president, and it is contemplated to build an electric line between Oil City and Franklin.

Hoboken, N. J.—One of the flywheels in the Hudson Electric Light Company's building burst early on Saturday morning, killing the engineer in charge, Carl Anderson, and severely hurting two others.

Seneca Falls, N. Y.—H. D. Lynne, of Geneva, has been awarded the contract for the construction work on the new electric road from Seneca Falls to Geneva. Mr. *Lynne* is one of the projectors of the road.

Beatrice, Neb.—The clerk of the council has been instructed to advertise for bids for supplying the city with *the same* number of electric lights now in use, the old contract having expired some time ago.

Pasadena, Cal.—An ordinance is to be prepared for *the city* council granting a franchise to Prof. T. S. C. Lowe for an electric railway connecting the Southern Pacific road with the Mount Lowe electric railroad.

Frederick, Md.—The board of aldermen has granted the Frederick and Middletown Railway Company a franchise to lay its railroad tracks, erect trolley poles and hang wires through the various streets of this city.

Detroit, Mich.—Detroit's new municipal lighting plant is now in operation, and for the first time in its history the city is in full control of its lighting system. There are about 1,500 electric lamps in place throughout the city.

Woonsocket, R. I.—The Woonsocket Electric Machine and Power Company has given up its franchise for lighting the town of Blackstone, and the authorities of that town have advertised for bids for an electric lighting service.

Glenolden, Pa.—The police and light committee and the highway committee of Glenolden borough council, after considering the question of lighting the borough, decided to have 50 electric lights of 25 c. p. placed at selected points.

New Orleans.—The Orleans Street Railway is being converted into an electric system.—The Traction Company has contracted with the J. G. Brill Company of Philadelphia for forty-five 22-foot cars, some of which have arrived.

San Jose, Cal.—The committee appointed by the board of trade to look into the proposition made by J. F. Pfetch and L. M. Hale to build an electric road from this city to Saratoga has reported in favor of indorsing the project.

St. Joseph, Mo.—The St. Joseph Traction and Lighting Company has sold its property and the company will be reorganized with an increased capital stock. The electric railway will be improved and extended, for which $500,000 in bonds will be issued.

Erie, Pa.—The charter and right of way have been secured for the proposed electric railway between Northeast and this city. The capital stock of the company is $250,000, and the road will be sixteen miles long, with branches running to a number of summer resorts.

Hagerstown, Md.—E. R. Sponseller, of Harrisburg, Pa., and Capt. Seidell, a wealthy Pennsylvania iron manufacturer, are applicants for a franchise for an electric railway in this city. Mr. Sponseller says if a franchise is granted to them they will commence building the road this fall.

Saginaw, Mich.—The township board has granted a 30-year franchise to the Saginaw Street Railway Company.—Besides three projects to build electric railways between Saginaw and Bay City, there is another one in view looking to the construction of a line to Bridgeport, six miles out from Saginaw.

Oshkosh, Wis.—It is authoritatively stated that work on the Interurban Electric Railway will begin in a few days. The line will be built by the Central Wisconsin Electric Railway Company; it will run from Oshkosh to Kaukauna, through the cities of Neenah, Appleton and Menasha, a total distance of 26 miles.

Atlanta, Ga.—The Electricity Building is one of the most admired on the grounds of the Exposition, but the exhibits within do not come up to expectation, chiefly owing to delay in sending or locating them. The General Electric Company occupies the center of the building and its exhibit is complete and attractive.

Tonawanda, N. Y.—Ground has been broken here for the promised experiments in propelling canal boats by electricity, which for some reason unknown did not materialize on the 25th of September, the date set for the test. Frank W. Hawley announces that the experiments will certainly take place as soon as the arrangements are completed.

St. Louis.—Some St. Louis County capitalists are alking of constructing a freight and passenger electric ine from the intersection of Longborough avenue and Gravoir road to Morse's Mill, in Jefferson County, a distance of 35 miles. This would drain a rich farming country which annually transports 50,000 tons of produce, etc., to St. Louis by wagon.

New York.—The sale of the People's Traction Company's franchise, which was postponed from the date set at first, will take place to-day (9th). The North New York Traction Company, it is said, proposes to bid gainst the People's for the franchise, which covers a number of streets and avenues in the northern suburbs, ast of the Harlem river.

Seattle, Wash.—The board of works has published a all for bids for furnishing street lights for 1896, according to the plans under which the present contracts were made. Bids will be received up to 2 o'clock, October 1.—By mutual consent the consolidation of the Union Electric Company and the Seattle Gas and Electric Light Company has been dissolved.

Greensburg, Pa.—The Greensburg and Pittsburg Electric Street Railroad Company has finally decided to close the deal for the Greensburg and Hempfield electric ne. Judge Saddler, of Carlisle, the president of the Greensburg and Pittsburg Company, has agreed to take the road. The road between Greensburg and Jeannette will, it is said, be in operation within thirty days.

Rushville, Ind.—The city council has decided to accept the proposition of the Howe Pump and Engine Company of Indianapolis to construct waterworks and electric light plants in this city. The proposition is to put in a water and light plant for $85,000 on a twenty-year franchise. The Howe Company is to purchase the present electric light plant of the city and run it in connection with the one it is to build.

Knoxville, Tenn.—The old Electric Light Company has been granted a ten-years' franchise for lighting the city at $80 per light.—There is a lively fight in progress between the Knoxville Electric Street Railway Company and the Citizens' Railway Company about laying tracks to the approaches of the bridges and on Central avenue. The council granted the right of way to the latter company, but the other company claims to have a prior right.

Allegan, Mich.—A deal by which Allegan will be connected with Saugatuck and Holland by an electric railroad has been nearly consummated. The name of the proposed road is to be the Holland, Saugatuck & Southeastern, and F. A. Makin, of Benton Harbor, is the general manager. Besides running the cars, the company proposes to string wires and furnish the city with electricity for lighting purposes.

Plattsburgh, N. Y.—The interests of Messrs. Myers, Kellogg and the Inman estate in the Plattsburgh Light, Heat and Power Company, have been purchased by New York parties. Messrs. Myers, Kellogg and Inman are succeeded on the board of directors by H. G. Runkle, of New York, and H. E. Barnard and A. E. Reynolds of Plattsburgh. H. M. Pierson and George M. Cole are the other members of the board as now constituted.

Syracuse, N. Y.—Some Philadelphia capitalists have a scheme in view that arouses much local interest. It is proposed to form a stock company to purchase Pleasant Beach on Onondaga lake and make it an attractive pleasure resort. An electric railway from this city to the beach is included in the plan. Mr. Daly of the Electrical Amusement Company of Philadelphia has been looking over the ground, and has expressed a very favorable opinion of the project.

Montreal, Can.—The eleventh annual report of the Royal Electric Company shows that the net gain on the fifteen months' operations was $106,209.14, out of which five quarterly dividends of 2 per cent. each, amounting to $99,900.10, have been declared, the remainder going to swell the balance of $308,758.98. The lights on the direct current arc system have been increased from 1,617 to 1,666; the lights on the alternating current incandescent system from 40,013 to 53,977, and the motors from 347 to 688 H. P.

Troy, N. Y.—The new electric railway between this city and Averill Park has been successfully operated as far as West Sandlake. The track is nearly completed to Averill Park. The new power station of the road is admirably constructed, and the apparatus is of the most modern design. The plant comprises three upright boilers of 150 horse-power each and two Westinghouse compound condensing engines of 225 horse-power each, connected directly with the generators, which are of the Westinghouse pattern.

Osawatomie, Kan.—Sealed proposals will be received by the board of trustees of the State charitable institutions until 3 o'clock P. M. on Monday, October 14, 1895, at the insane asylum in Osawatomie, for the construction of an electric light plant for that institution. Separate proposals will be received for engines, for dynamos and for counter shaft, or proposals will be received for these three parts complete and in place. Separate proposals will also be received for wiring the buildings complete, and also for the construction of a power house.

Bingham, Utah.—O. B. Hardy and W. J. Moorhead have asked the county court for a franchise to build and operate an electric plant for furnishing light and heat and maintaining and operating electric railroads in the West Mountain district, with headquarters at Bingham. Another purpose is to erect an electrical plant for the precipitation of the copper that is known to exist in the waters of certain springs situated just above this town in the main canyon. The two men agree to light the jail at Bingham during the life of the franchise, free of cost to Salt Lake County. The application was referred to the county attorney.

Hopedale, Mass.—It is reported that the Hopedale Electric Company has been communicating with the big Philadelphia storage battery syndicate in reference to a union with the latter concern. The Hopedale Electric Company was incorporated in 1892 with a cap tal stock of $5,000,000, for the manufacture and equipment of cars on the Stevens storage battery patents. The company had cars in operation by this system on the Milford and Hopedale line when the Brush Company began a suit for infringement and enjoined the company from using the battery. The suit, begun nearly two years ago, has not been terminated.

Philadelphia.—The Union Traction Company has formally assumed control of every street railway line in the city with the exception of the Hestonville, thus completing the scheme of consolidation and putting an end to the many recent reports throwing doubt on the stability of the deal.—The directors of the Electric Storage Battery Company have elected five new directors—Clement A. Griscom, Rudolph Ellis, William D. Windsor and Joseph F. Sinnott, of this city, and Edward Tuck, of New York. Three more directors are still to be elected, all of whom will come from New York. The board will then consist of fourteen members instead of seven.

Boston.—The Railroad Commissioners have given the Lowell and Suburban Street Railway Company authority to issue $176,500 for payment of the floating debt and $63,500 for the purchase of a pleasure park, and specify that the new stock must be sold at not less than $115 per share, which will give the company $202,975 for the floating debt and $73,025 for a park, making a total of $276,000 received on a sale of but $240,000 worth of stock at par value. The company some time ago asked for authority to issue $400,000 new stock, of which $300,000 was to be used to pay the floating indebtedness caused by changing the motive power from horse to electric power, the remaining $100,000 to be for the purchase of a pleasure park.

Milwaukee, Wis.—The "Wisconsin" says: "An electric trolley line offering quick service and cheap transportation from Chicago to the lake region north is what is proposed by the Chicago and Wisconsin Inland Lakes Railroad Company, which has just been incorporated by Chicago capitalists under the laws of Wisconsin. The route of the projected line is not as yet specifically laid down, but it is proposed to run from a central point in Chicago to Madison, with branch lines to all the intermediate lake resorts. If found advisable a line will be run also to Milwaukee, and the entire system further extended. The incorporators and directors of the road are A. E. Case, Frank Boden, S. Marcus Rothschild, A. J. Toolen and G. D. Green. A. E. Case is also attorney for the road. The company is capitalized for $10,000,000."

Waukegan, Wis.—Construction work on the long-proposed electric railroad line between Chicago and Milwaukee has been begun at Waukegan, and nearly one-half of the road will be completed, it is said, by next summer.—The city council has granted an amended ordinance to the Bluff City Electric Street Railway Company, with the right to lay its tracks on five miles of streets. This company has also applied for franchises which will give it the right to extend the line to South Evanston. The plan of the company is to build a line from Waukegan to Evanston. The distance is twenty miles. The line passes through Lake Bluff, Lake Forest, Fort Sheridan, Highwood, Highland Park, Glencoe, Winnetka, Wilmette and North Evanston, and will terminate, if the council allows, at Davis street in Evanston. A franchise will have to be obtained in each one of these towns and villages, and besides one of the grants will have to come from a board of county commissioners. It is intended if the franchises are granted to change the name of the company to the Bluff City Interurban Electric Company and place its capital at $500,000.

Niagara Falls.—A party of directors of the United Tramways Company of Dublin, Ireland, have been recently visiting here. They have come to this country to inspect the various systems of electric railways in the United States and Canada, with a view to introducing the best one on their tramways, which cover the city of Dublin and its vicinity. In the party are William Carte, chairman of the board; John R. Wigham, president of the Dublin Chamber of Commerce; William Murphy, a prominent politician and director of the "Freeman's Journal," and William Anderson, secretary and manager of the company.—Capt. A. E. Hunt, president of the Pittsburg Reduction Company, says that his company will take from the Niagara Falls Hydraulic Company an additional 4,500 horse-power, to be delivered off the shafts of the turbines of the Canal Company. The turbines are to be below the cliff, and the power house, which will also be beneath the bank, at the water's edge, will have six dynamos of 750 horse-power each. The dynamos are being constructed by the Westinghouse Electric and Manufacturing Company of Pittsburg. Above the bank will be the building for the manufacture of aluminum.—The officials of the Cataract Construction Company held a meeting here on Monday of last week, and among other things took up for consideration the Buffalo franchise. Several clauses in the document did not meet the approval of the officials, who decided to accept the franchise if the alterations they submitted were made by the authorities of Buffalo.

COMMERCIAL PARAGRAPHS.

The contract for a 15-ton electric crane, which will traverse the entire length of the main building of the new plant of the Franklin Steel Casting Company, Franklin, Pa., is but one of the number recently closed by the Morgan Engineering Company, Alliance, O.

Those who receive from the Forest City Electric Works, Cleveland, O., the novel reminders they are sending to the trade, will be certain to "bear in mind" the many good points possessed by the Roll Drop Commutator Bars.

The Proctor-Raymond Company, of Buffalo, N. Y., has purchased the business, machinery and stock of the Proctor-Raymond Electric Company, formerly of Rochester, N. Y., and will continue the manufacture of the specialties put on the market by the latter concern.

Joseph Lee, general electric millwright and agent for standard motors and dynamos, has removed his office and factory from Brooklyn to 2, 4 and 6 Reade street, New York.

C. S. Van Nuis, of Ajax Switch fame, 136 Liberty street, New York, is soon to place a new low potential direct current arc lamp on the market.

The Emerson Electric Manufacturing Company, St. Louis, Mo., have issued a very complete catalogue of the many specialties they are now manufacturing.

The Standard Underground Cable Company has secured the contract for furnishing underground cables for the telegraph department of the city of Buffalo, N. Y.

After a competitive test, conducted under severe con tions by the United Electric Light and Power Company

New York, a contract was awarded this week to the Fleming-Spence Electric Company, 654 Hudson street, New York, for a large number of their new type alternating current arc lamps.

Imperial Incandescent Lamps.

In their forthcoming catalogue of incandescent lamps the Bryan-Marsh Company will publish the accompanying table, which is a tabulation by them showing the range of efficiencies in which the Imperial Incandescent Lamp is made. By reference to the table it will be seen that one-watt lamps are now made ranging from 3 to 10 C. P. and from 3 to 16 volts. These very high efficiency lamps are employed by the Electric Storage Battery Company to a considerable extent, as well as for bicycle lamps, train lighting, etc., being used for the latter purpose at an efficiency of two watts per candle.

According to this table sixteen candle power lamps are now furnished of an efficiency of 2.5 watts per candle at commercial voltages ranging from 50 to 125. The Bryan-Marsh Company state that many such lamps are now being used by several large central stations:

Normal Candle Power.	1 Watt.	2 Watt.	2½ Watt	3 Watt.	3½ Watt	4 Watt.
	Volts.	Volts.	Volts.	Volts.	Volts.	Volts.

BUSINESS HINTS.

[The following summary is prepared weekly for ELECTRICITY for the information of advertisers and readers who are dealers in apparatus and articles required in the electrical equipment of public and private buildings.]

Billings, Mont.—It is proposed to erect a brick opera house on Montana ave.

Brooklyn, N. Y.—M. Mulvihill will erect 2 four story double apartment houses, northeast cor. of Lexington and Tompkins ave....S. F. Buckhout will build 3 four story double apartment houses on east side of Franklin ave., south of Java st. .. Postmaster Sullivan contemplates the erection of a handsome residence in the 29th ward.

Buffalo, N. Y.—The owners of the new Guarantee Building, which is under construction at Pearl and Church sts., contemplate putting up a new hotel and theater in the vicinity of Pearl and Franklin sts....The office building to be erected by the Ellicott Square Company will have 1 freight and 15 passenger elevators and the electric light plant will consist of four dynamos and 7,000 lights each of 16 C. P.

Cleveland, O.—Auld & Conger will erect a six story steel building on Prospect st. at once.

Dover, Del.—It is probable that an opera house will be erected in a short time by Harry A. Richardson.

Flatbush (Brooklyn), N. Y.—The buildings to be erected at the Flatbush Asylum are to be lighted by electricity.

Helena, Mont.—The site has been selected for the State building. The building will have complete heating, ventilating and lighting apparatus and an elevator connecting all the floors.

Hoboken, N. J.—L. Beyer, of Hoboken, has prepared plans for the Public Library building which have been accepted by the Library Commission; the structure will be three stories and basement; specifications include steam-heating plant, electric wiring and fixtures, etc.

Kingston, N. Y.—Adolph Richler, proprietor of Hotel Richler, will erect a hotel northeast cor. of Broadway and Dederick st., which will be lighted by gas and electricity.

Minneapolis, Minn.—Minneapolis Chamber of Commerce will be rebuilt and enlarged, to cost $130,000.

New Haven, Conn.—Police Commissioner Roosevelt, of New York City, will build a summer residence near Green Farms, to cost $200,000.

New York City.—Architect John R. Thomas, 160 Broadway, is preparing plans for an eighteen story fire-proof building to be erected on the old Clearing House site, northwest cor. of Nassau and Pine sts., on property recently purchased from the Clearing House Association by Donald Mackay .. Schenk & Schlichts will erect a six story factory, from plans prepared by John P. Voelker, at 22-23 Jones st., which will be heated by steam and lighted by electricity ..Blake & Massey, 30 West 132d st., will erect a five story flat on south side of 38th st., west of Amsterdam ave.; Architects Webster & Thompson, 215 West 125th st.; also 4 five story brick flats, on south side of 88th st., west of Amsterdam ave.; same architects . Frederick Haas, 307 West 38th st., will erect a seven story flat on northwest cor. of West End ave. and 91st st.; Architect W. O. Tait, 65 Fifth ave... Catherine Aste will erect a five story flat at 220 and 222 Sullivan st.; Architect Henry Gilvany, 1 Broadway ...Spencer Aldrich, 107 East 34th st., will build a four story and basement brick dwelling on northeast cor. of West End ave. and 72d st.; Architect G. A. Schlessinger, 128 Broadway... Ella A. Guthrie, 51 Park ave., will erect 5 brick dwellings at 22 Park ave.; Architects McKim, Mead & White, 160 5th ave.

Philadelphia, Pa.—Estimates are being received by Charles Anchter for the erection of the new hall for the Labor Lyceum, to be built at 2d and Cambria sts.. to contain a gymnasium and other improvements essential.... Plans are nearly completed for the Surgical Amphitheater to be erected by the Medico-Chirurgical College and Hospital; the structure will cost about $100,000.

Providence, R. I.—The excavation for the foundation of a hotel has been commenced on Thames st. by Contractor Eugene Leclair; the structure will be four stories, 200 x 40, and contain modern improvements.

INCORPORATIONS.

The Chamberlain Electric Lighting Company, Chamberlain, S. D.—to operate an electric light plant. Capital stock, $10,500. Promoters: C. D. Tidrick, W. L. Montgomery, G. W. Pitts, Chamberlain.

The Archbald Electric Street Railway Company, Archbald, Pa.—to build a street railway in Archbald. Capital stock, $30,000. Promoters: James Kane, Winton, Pa.; Edw. Munley, Michael J. Moran, Archbald.

The Des Moines Heating Company, Des Moines, Iowa—to purchase, build, maintain and operate steam and electrical plants. Capital stock, $100,000. Promoters: M. P. Turner, I. S. Polk, G. B. Hipper.

The Electric Arc Light Company, New York City—to deal in electrical appliances. Capital stock, $100,000. Promoters: Lionel Sutro, L. B. Marks, H. C. Skelly, New York City.

The Citizens' Light, Heat and Power Company, Columbus, Ohio—to establish and maintain an electric plant and furnish electricity to the public. Capital stock, $200,000. Promoters: Chas. S. Knight, Thos. Cooper, David C. Beggs, Ronald T. McDonald, Ralph R. Rickly.

The Vandergrift Water Company, Vandergrift, Pa.—to operate an electric light plant. Capital stock, $1,000. Promoters: S. H. Vandergrift, Geo. Mercer, Jr., Vergyl Preston, Pittsburg, Pa.

The Croton Valley Electric Railway Company—to construct a narrow gauge street surface railroad, about four miles long, from the New York Central Depot in Croton-on-Hudson to the new Cornell Dam. Capital stock, $10,000. Directors: Charles E. Grattan, Edward White, Robert B. Wright, and others of Croton-on-Hudson.

The Marine Electric Propeller Company, Minneapolis—to manufacture electric boat propellers. Capital stock, $27,500.

The Troy, Tippecanoe & Dayton Railway Company—to build and operate an electric railway between Troy, Ohio, and Dayton, by way of Tippecanoe, taking the most practical route. Incorporators: Theodore Sullivan, George S. Long, Geo. W. Scott, J. F. Knopp, Philip J. Gates, W. R. Thompson, F. M. Sterritt and W. H. Weekley. Messrs. Knopp, Gates, Thompson, Long, Sullivan and Scott are residents of Marion County, Ohio, while Weekley lives in Dayton. Mr. Sterritt is a brother of Dr. J. A. Sterritt, formerly Representative from Marion County.

The Wetheredville, Franklintown & Edmondson Avenue Electric Railway Company has filed articles of incorporation in the clerk's office at Towson, Md. The capital stock is $25,000. Incorporators: William Ferguson, Joseph Henry Judik, Charles W. Dorsey, Dr. Joseph C. Monmonier and Levi Z. Conden.

The Central New York Light and Power Company—to supply electricity in Oneida and Canajoharie and in places within five miles of these villages. Capital stock, $100,000. Directors: H. Walter Webb and Wm. H. Gelshennen, of New York City; Wm. J. Arkell, of Canajoharie, Judson M. Warner, of Oneida, and Alden M. Young, of Waterbury, Conn.

The Irondequoit & Lake Shore Electric Railroad Company—to construct a street surface road from Forest Lawn, in the town of Webster, Monroe County, N. Y., to a point near the intersection of the shore of Lake Ontario with the easterly bank of the Genesee River in the town of Irondequoit. Capital stock, $100,000. Directors: A. J. Johnson, Joseph C. Tone, Joseph A. Johnson, Frank W. Elwood and Edward S. Ellwanger, of Rochester; E. O. McNair and David W. McNair, of Warsaw, N. Y.

Articles of association have been signed for the formation of a new electric street railway company in Dedham, to be known as the Norfolk Central Street Railway. The line is to be ten miles long and of standard gauge. The board of directors is composed of Hon. R. Bullard, Thomas T. Robinson, Dr. John W. Chase, Henry C. Delano, Ferdinand F. Favor, all of Dedham, Mass.; Francis Doane, of Norwood, and A. R. Whittier, of Boston.

The Monroe Electric Railroad Company, of Monroe, Mich.—to build a street railway from the eastern to the western city limits of Monroe, with a view of extending it to Dundee. Capital stock, $50,000. Incorporators: F. C. Rauch, A. B. Bragdon, F. G. Strong, Fred. H. Humphrey and W. H. Cowles, of Monroe; George M. Jewett, of New York; George M. Stearns, of Chelsea, Mass., and L. E. Walkins, of Boston. The following officers were agreed upon: President and manager, W. H. Cowles; secretary, F. G. Strong; treasurer, L. E. Walkins.

The Chicago Electric Street Railway Company, Chicago, Ill.—to construct, equip and operate street railroads and subways in the City of Chicago. Capital stock, $5,000,000. Promoters: Sherman D. Parnia, John Parrott, O. W. Larson.

The Merced Falls Electric Power and Manufacturing Company, San Francisco—to furnish electric power for operating mines, railroads, electric light for cities, towns; deal generally in land and water rights, etc. Capital stock, $1,000,000. Directors: R. H. Duncan, Herman Juan, San Francisco; Augustus Laver, Alameda; Basil Owen, London, Eng.

The Equitable Electric Light Company, of Baltimore County, Baltimore, Md.—to supply electric light and power. Capital stock, $50,000. Incorporators: Henry A. Parr, John Cowan, George R. Webb, J. William Middendorf and Richard R. Culbreth.

The Shuttleworth Electric Company, Camden, N. J.—to manufacture, lease, buy and operate electrical apparatus, motors and other articles, etc., for the utilization of the electro-magnetic induction system of propulsion devised by the said Stephen C. Shuttleworth and known as the Shuttleworth system. Capital stock, $100,000. Promoters: Alphus C. Shuttleworth, Hugo M. Quinn, Philip R. Wells, Howard A. Engle, W. Howard Holden, Louis F. Brons, Frankford, Pa.; John L. Burk, Holly Beach, N. J.

The Dwyer Motor Company, Portland, Me.—to manufacture gasoline, petroleum, electric and other motors. Capital stock, $100,000. President, George H. Hewitt; treasurer, Theodore N. Lute, both of Springfield, Mass.

The Safety Electric Elevator Company, San Francisco, Cal.—to construct, build, sell and deal in elevators; manufacture and generate electric power, light and heat; deal in patent rights, etc. Capital stock, $100,000. Promoters: John W. Gentry, John Cushing. N. W. Spaulding, R. D. Hunter, Oakland; Jeffrey Jacob, Fruitvale, Cal.

MOONLIGHT SCHEDULE FOR THE UNITED STATES.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED OCTOBER 1, 1895.

ELECTRIC RAILWAYS AND APPLIANCES.

547,068. Electric-Motor Truck. William G. Gaither and William R. Gaither, Chicago, Ill. Filed Nov. 10, 1894.

547,077. Electric-Railway Repair-Wagon. Anthony Iske and Albert Iske, Lancaster, Pa. Filed Dec. 18, 1894.

547,283. Trolley and Trolley-Pole. Wilbur L. Pepper, Philadelphia, Pa. Filed Dec. 29, 1894.

547,302. Electric Motor for Street-Cars. William Stine, Omaha, Neb. Filed Jan. 11, 1895.

547,304. Conduit Supply System for Electric Railways. George Tolmie, Carbon, Wyo. Filed July 10, 1894.

547,369. Device for Controlling Speed of Electric Cars. James Brady, Brooklyn, N. Y. Filed June 24, 1895.

ELECTRIC LIGHTS AND APPLIANCES.

547,106. Hanger-Board for Electric Arc Lamps. Thomas E. Adams, Cleveland, O., assignor to the Adams-Bagnall Electric Company, same place. Filed July 17, 1895.

547,127. Electric-Arc Lamp. Johan W. T. Olan, New York, N. Y. Filed April 8, 1893.

547,246. Mast-Arm for Electric Lamps. John I. Drake, Providence, R. I. Filed Feb. 21, 1895.

547,249. Incandescent Lamp. Henry Green, Hartford, Conn., assignor to the Ætna Electric Company, same place. Filed Jan. 25, 1895.

DYNAMO ELECTRIC MACHINERY, ETC.

546,996. Armature for Electric Motors and Dynamo-Electric Machines. Henry Chitty, London, England. Filed July 26, 1892.

547,043. Rectifier for Electrical Currents. William J. Still, Toronto, Canada, assignor to William Burrowes Close, same place. Filed Dec. 24, 1894.

547,069. Rotary Field-Motor. Johannes H. F. Georges, Berlin, Germany, assignor, by mesne assignments, to the Siemens & Halske Electric Company of America, Chicago, Ill. Filed Oct. 10, 1893.

547,323. Electric Motor. Addison E. Boggs, Allegheny, and Fremont J. Cleaver, Beltzhoover, Pa. Filed Jan. 4, 1895.

547,383. Reciprocating Electric Engine. Frank B. Rae, Detroit, Mich. Filed May 31, 1892.

TELEPHONE AND TELEGRAPH APPARATUS.

547,265. Telephone. Harry T. Johnson, Elizabeth, N. J. Filed June 18, 1894.

547,388. Telephone-Exchange System. Ernest E. Yaxley and John H. Riley, Chicago, Ill., assignors of one-half to Le Roy Brown, same place. Filed Jan. 14, 1895.

547,405. Telephone-Toll Apparatus. George K. Thompson, Malden, Mass., assignor to the American Bell Telephone Company of Massachusetts. Filed May [illegible] 1895.

MISCELLANEOUS.

547,031. Contact for Electrically-Propelled Vehicles. Emil B. W. Reichel, Charlottenburg, Germany, assignor, by mesne assignments, to the Siemens & Halske Electric Company of America, Chicago, Ill. Filed April 4, 1894.

547,034. Electric Vibrator Mechanism. Frank J. Russell, New York, N. Y., assignor of one-half to Horace See, same place. Filed April 15, 1895.

547,035. Electrical Indicating Mechanism. Frank J. Russell, New York, N. Y., assignor of one-half to Horace See, same place. Filed April 15, 1895.

547,072. Electric Device for Controlling Actions of Musical Instruments. Frederick W. Hedgeland, Chicago, Ill., assignor to the W. W. Kimball Company, same place. Filed Feb. 23, 1894.

547,078. Electrical Junction-Box. Warren S. Johnson, Milwaukee, Wis. Filed Jan. 21, 1895.

547,120. Insulating Compound. Salomon Heimann, New York, N. Y., assignor of eleven-twentieths to Leopold Katzenstein, same place. Filed Feb. 28, 1895.

547,149. Electric Switch. Norman Marshall, Boston, Mass., assignor to the Anchor Electric Company, same place. Filed June 8, 1895.

547,215. Portable Electric Drill. John W. Jamison, Vallejo and John M. Edmunds, Napa, Cal. Filed Dec. 5, 1894.

547,230. Automatic Electric Switch. George W. Russell, Jr., and Alexander V. Officer, Denver, Col. Filed March 18, 1895.

THE TELEPHONE WORLD.

THE BERLINER PATENTS.

To the Editor of ELECTRICITY.

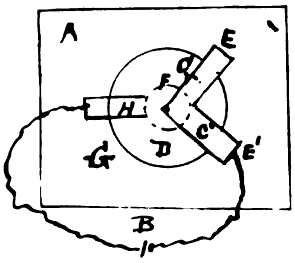
Sir: The queries of your correspondent, and more particularly your answers, in your issue of September 11, relative to the Berliner patent, interested me very much. There is hardly a paper devoted to the subject of electricity that does not contain an advertisement worded as follows: "The American Bell Telephone Company.—This company owns Letters Patent No. 463,569, granted to Emile Berliner November 17, 1891, for a combined telegraph and telephone covering all forms of microphone transmitters or contact telephones." Allow me to take issue with you and with the assumption contained in the above copied advertisement.

There is no disputing that the Bell owns a patent on a certain kind of microphone, but I for one will not sit quietly by and let a corporation appropriate unto themselves that which I believe belongs to the public. Hence please allow me to give through the columns of your valuable paper the grounds upon which I base my denial.

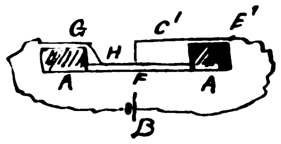
You say Berliner's disclaimer is an acknowledgment by him that a method of which his was relatively but a species had existed before his invention. How does Bell's genus, viz., the method of producing undulations in a continuous voltaic circuit by gradually increasing and diminishing the resistance of the circuit differ from Berliner's genus, viz., the method of producing in a circuit electrical undulations similar in form to sound waves by causing the sound waves to vary the pressure between the electrodes in constant contact? For my part I see no difference; both commence with the words "The method of producing." Here Berliner adds the words "in a circuit electrical," which are the same kind of undulations understood by Bell's undulations. Both use the word "undulations." Bell adds after the word undulations "in a continuous voltaic circuit," which can be done only when the electrodes are in constant contact. The idea is the same in both. Berliner modifies his undulations by "similar in form to sound waves." Bell's whole patent refers to nothing else but sound-wave undulations. Both are the same in this respect. Right here Berliner still adds "by causing the sound waves to vary the pressure between the electrodes in constant contact." He says in his disclaimer, "Neither do I claim that I am the first who caused electrical undulations similar in form to sound waves by varying the resistance of an electric circuit in which a current was passing," which throws out the fore part of Berliner's broad claim up to and including the words "sound waves." Now, it remains to be seen whether "by causing the sound waves to vary the pressure between electrodes" was first invented by Berliner. I turn to page 540 U. S. Rep., vol. 126, and read: "Reis discovered how to reproduce musical tones." (Reis died in 1874.) Musical tones are sound waves. On page 290 U. S. Rep. are shown two diagrams used by the Bell's attorney and described as follows:

"The transmitter A consists of a hollow box about four inches square and deep. The top or cover is pierced with a round hole over which is stretched a membrane about 1¼ inches in diameter. To this is cemented a strip of flexible platinum foil (H in the diagram). A piece of brass (C, C′ in the diagram), shaped like two sides of a right-angled triangle, is provided at the angle and at each extremity with a little leg made of a small pin of platinum, so that it can stand on the three like a tripod. Two of these legs (E, E′ in the diagram) rest on the frame of the instrument, while the third, placed at the angle, rests on the spatula-shaped end of the platinum foil, H, at the center of the diaphragm. The instrument is so connected with a battery, B, that when at rest the current flows to the foil at G, through the foil H, to the platinum leg resting on it at F, through one branch C, on the angle piece to its leg at E, which is connected with a wire leading back to the battery."

Now it is evident to any telephonist that by the third platinum leg resting on the foil H the force of gravity would make the electrodes to be in constant contact. Any vibrations up to vibrations of a certain amplitude would impart similar vibrations to the platinum leg without breaking the contact. This is what Reis succeeded in doing, for he says: "The consonants are for the most part reproduced pretty distinctly, but the vowels as yet not in an equal degree" (U. S. Rep. 126, page 42). That is, the vowels produced vibrations of too great amplitude for the platinum electrodes. And had he the delicate receiver of the present day, he could have reproduced a conversation carried on in a whisper. The pressure was caused by the voice—in other words, sound waves. All that was lacking to make this a good transmitter was the carbon in the place of the platinum. Without the carbon of Edison, Berliner's transmitter will not transmit any better than a Reis. It was not the Berliner that brought the microphone up to a commercial success, it was the Edison carbon. Blake's transmitter was modeled after Reis's and not after Berliner's.



The Supreme Court says: "It is not contended that Reis had ever succeeded in actually transmitting speech, but only his instrument was capable of it if he had known how." Again: ". . . it was not until after Bell's success that he found out how to use a Reis instrument so as to make it transmit speech. Bell taught him what to do to accomplish that purpose." (U. S. Rep. 126, pages 542–545.) What did Bell do to make a Reis instrument transmit speech? It was the invention of the magneto receiver, and the introduction of a carbon leg in the place of the platinum wire. Speaking against the Reis diaphragm in a loud tone would cause a make and break contact, so will the same loud sound against the Berliner diaphragm break the contact, and a very loud sound against a Blake transmitter will do the same, thereby making an unintelligible blurring noise. How many times we hear spoken over the 'phone, "You speak too loud; speak lower." This is because the loudness of the voice causes the electrodes to make and break contact. Berliner's is not a telephone for the same reason that Reis's is not. Now what is left of Berliner's so-called broad claim, not before invented? Only what is claimed in the words "as described," which shows a metal ball C terminating the screw-threaded rod B. This piece of mechanism is truly novel and patentable.



You say that Bell's fourth claim "distinctly describes a genus method to which Berliner's is a species, and is evidently exactly what Berliner referred to in his disclaimer." Berliner certainly knew that Reis had produced an instrument which he (Reis) named a telephone, which instrument was so constructed as to be operated by sound waves. These sound waves increased and decreased the resistance of the circuit at the point F, even if it did at times make and break the circuit. May we not suppose that Berliner's disclaimer not only disclaims what Bell and Gray had accomplished but also what all other inventors previous to Bell had solved and produced in the variable resistance field? Is it not this very disclaimer which will save Berliner's claims one and two from annulment by the Supreme Court?

If Berliner had used in place of the words "sound waves" the term articulate speech waves, we might then accord to him the generic patent on that kind of a microphone. But for him to claim credit for what had been done years before is plagiarism of which I do not accuse him. You say Bell intended to cover all methods of producing undulatory currents by varying the resistance of the circuit. Is Bell guilty of plagiarism? He is if your construction of his intentions are correct. The Supreme Court admits that others long prior to Bell transmitted tones through the agency of a battery telephone; and since experience has proven that in no other way can sound waves be transmitted by the agency of a battery 'phone other than that of varying the pressure between the electrodes, practically speaking it is an admission on the part of said Court that others long before Berliner's day caused sound waves to vary the pressure between the electrodes in constant contact. These earlier inventors, Reis and others, may not have arrived at the true theory of such transmission. They may have supposed that their instruments in reproducing sound waves did so by making and breaking the circuit at each wave. But this is not so, as Bell proves in his specification of his first patent. Tones cannot be produced by making and breaking the circuit. Reis produced tones. The Supreme Court admits this. A click can be heard when a make and break contact has been made, or a blurring noise, but no tones. The Supreme Court says: "Reis discovered how to reproduce musical tones; but he did no more. He could sing through his apparatus, but he could not talk" (U. S. Rep. 126, page 540). This can only be done by varying the pressure between the electrodes. "It is not contended that Reis had ever succeeded in actually transmitting speech, but only his instrument was capable of it if he had known how" (*Ibid*, page 542). Here is an admission by the Supreme Court that Reis's instrument was capable of transmitting speech if he had known how; that is, if he had used carbon instead of platinum, and the use of a magneto 'phone receiver. A Berliner microphone is no better than the Reis, and in proof of this, it has never been in commercial use. Neither has the Berliner, through any improvement or improvements, paved the way to make a battery 'phone a success. All improvements in the microphone have been in the line of the Reis and not Berliner. In witness of this, see Reis's microphone of 1861, modeled after the human ear.

In view of the facts as herein presented, how a person can say that the Berliner is a generic patent is beyond my comprehension. If Berliner had been the first in this field I would be the last to rob him of that which is rightfully his, but on the other hand I cannot too highly condemn the inventor who seeks fame from the product of some other inventive brain.

Chicago, Ill. HELLO.

[Bell's method of producing electrical undulations was the broad one of causing the sound waves to vary the resistance in a similar manner. This covers broadly all possible methods by which sound waves may vary the resistance of an electrical circuit for telephonic purposes. It is unqualifiedly a generic claim. Bell specified several methods, one of which was by varying the depth of immersion of one of the electrodes in a liquid connected with the other. The specific methods named by Bell in his patent are now public property because that patent has expired. He did not mention the method of varying the pressure between electrodes in constant contact, and there is no indication that he knew that such a method would produce the results desired. Berliner claims to have discovered that this method was effective and patented it. The qualifying clauses which our correspondent quotes are essentially the same in both patents except the one in Berliner's "by causing the sound waves to *vary the pressure* between electrodes always in contact." This clause differentiates Bell's device and Reis's from Berliner's.

From the sketches and our elaborate explanation it will be perfectly clear that Reis did not anticipate Berliner, because Reis's idea was not to vary the pressure between electrodes *always in contact* but to *break* the contact. By Reis's method there was no possibility of producing electrical waves exactly similar to the waves of the human voice. By Reis's method the waves were all of exactly the same height, the only possible variation being the frequency with which they might follow each other, which constitutes the *pitch* of a musical note. That is but a minor factor in articulate speech but an essential in music. Just what were the essentials to speech, there is no evidence that Reis knew. If it could be proved that he did not endeavor to have his transmitter interrupt the circuit it might be inferred that he did know, but the very construction of his instrument is evidence almost indisputable that he did not understand the proper principle. Had he understood it, it would have been a very simple expedient either to have made his triangular electrode heavier or to have maintained its contact with the diaphragm by means of a spring.

We do not think that Bell is guilty of plagiarism. His great discovery was not how to make sound waves vary the resistance of a circuit, but that if sound waves were caused to vary the resistance of the circuit so as to produce electrical waves in that circuit which were *similar* to sound waves, then he could transmit articulate speech. Reis had already caused sound waves to vary the resistance of the circuit—had caused them to interrupt the circuit, but the current flowing under these conditions bore no resemblance in its variations to the sound waves which cause the variations.

Our correspondent is away off when he says "since experience has proven that in no other way can sound waves be transmitted by the agency of a battery 'phone other than that of varying the pressure between the electrodes," for experience has proved just the contrary. His conclusions therefore have no basis in fact.

He is again wrong in his statement that "tones cannot be produced by making and breaking the circuit." Tones *can* be so produced and were so produced by Reis and others. All the conclusions based on this premise are also, therefore, fallacious.

On what does "Hello" base his statement that "all improvements in the microphone have been in the line of the Reis and not the Berliner (method)?"

He seems to be very positive in all of his statements, but at the same time shows such a lamentable ignorance of the subject of acoustics and the art of telephony that we would suggest more moderation in future in his controversial essays.—Ed.]

Why the Bell Company is a Trust.

To the Editor of Electricity.

Sir: The movement to prevent the illegal combination between the American Bell Telephone Company, the Western Union Telegraph Company, the Western Electric Company, the American Telephone and Telegraph Company and the licensees of the Bell Company has not taken the form of an action by the Telephone Protective Association, or by the Western Telephone Construction Company particularly. The writer has assumed the responsibility.

In the writer's opinion the Western Union and American Bell contract is clearly in violation of Federal and State laws. This contract provides that the Western Union will withdraw from competition; that the Bell Company will monopolize the various telephone interests of the country, including the purchase or control of telephone patents desired for this purpose.

The contract further provides for a minimum rate at which telephones shall be put out. Prices were raised; competition was specifically agreed against. A stipulating clause provides that $15.00 be the net price, or royalty, demanded by the Bell Company upon the telephone exchange subscriber's station from the licensee. The contract further provided, specifically, that reduction in these prices be made when, for the interest of this combination, it became necessary to throttle competition. In conformity with this agreement the monopoly has directed its licensees to cut the rates.

These cut rates, and this policy of oppression, where competition is started, are so clearly in pursuance of this illegal combination that there is no question in the writer's mind but that telephone exchanges throughout the United States, which are met with this sort of oppression, will ask for restraining injunctions, and get them.

This is the most gigantic and monstrous effort for the annihilation of competition that the writer has ever heard of. A specific written agreement, which plans the stifling of competition; the raising of rates; the monopolization and exclusive control of the greatest industrial art of the day, even to the extent of buying up and side-tracking other inventions, is so disastrous to public policy that the writer cannot rest while it stands.

It seems that some one had to take hold of it in order to have it done, and, while overburdened with duties of another nature, I hope to find time to prosecute my efforts in this direction to a successful conclusion, believing thoroughly and firmly that I am right and that it is necessary for some one to bear the burden and responsibility.

Already this movement has been charged as an effort to affect Bell stock. You know that the writer has no interest whatever in Bell stock, except as it might be affected in the just, open right of people to do a telephone business at this time. I expect to be charged with all sorts of motives, but this will have no effect. The combination seems absolutely and clearly unlawful and the sooner it is broken the better.

The Bell Company has spent a tremendous amount of money invoking the law to aid them in maintaining a monopoly. They have flaunted their patents in the faces of almost every court in this country. They have hidden this unlawful compact from the public. It is to be hoped that the law will now sustain itself against their illegal conspiracy as fully, or one-hundredth part as fully even, as it has been sustained to maintain that monopoly.

Data is being prepared to properly present in the form of a petition; and as the Bell Company seems to love law so well, possibly it may have misinterpreted its meaning as affecting them.

Very truly,
J. E. Keelyn.

Chicago, Ill., September 24, 1895.

To Sell Telephone Privileges.

An ordinance has been introduced in the select council of Philadelphia, authorizing the Mayor to have plans and specifications prepared for the construction of a public telephone system, and to advertise for proposals for the sale of the privilege to construct, maintain and operate the system. The ordinance requires companies bidding for the privileges to specify what percentage of gross receipts they will agree to pay for, and the shortest time in which they will obligate themselves to construct a complete telephone service.

Bidders must submit satisfactory evidence of their financial ability to carry out any contract to be made with the city, and of the efficiency of the apparatus proposed to be employed, and of their right to use the same. The successful company is to be awarded all necessary street and underground privileges and is empowered to lease any underground system owned by other companies. It shall furnish for the free use of the city one duct in its conduits, and shall maintain telephones in all of the State, county and municipal offices, including police stations, public schools and hospitals.

The company shall fix in its bid the maximum cost of its annual service and shall afford any companies applying for the same entrance to its exchanges and facilities for telephonic communication with its subscribers. The company securing the contract shall pay a license to the city and give a bond in the sum of $100,000. It is forbidden to sell or lease to any telegraph or telephone company or corporation or individual the rights and franchises conferred by this ordinance, under the penalty of making all the grants obtained under its provisions null and void.

"Doing a Valuable Work."

To the Editor of Electricity.

Dear Sir: Having read with much interest several articles in your valuable publication, touching upon the telephone situation, and believing that you are doing a valuable work, as an interested party I herewith enclose a voucher for the subscription price of your journal for one year.

It may be of interest to you to know that we have an exchange here in full operation, using 300 phones. The Bell Company has put forth every effort to defeat us, but the people are standing right by us. I have secured a franchise and am at work on the construction of a plant at Charleston, W. Va., having 250 subscribers signed for five years.

I fear that the manufacturers are not as active as they should be in defending the various suits brought by the Bell people.

Very truly yours,
The Lynchburg Telephone Company,
W. P. Roberts, President.

Lynchburg, Va., September 30, 1895.

Will Pay to Be Sued.

That there are some telephone manufacturers who have not become frightened by the threats of suits by the Bell Company is made evident by a recent declaration from the Manhattan Electrical Supply Company, New York. This company has issued a card to the trade in which they make the following statements:

"We will pay $100 for the privilege of defending a suit brought by the Bell Telephone Company on the Berliner patent against dealers or users of our telephones; the action to be brought in any State in the Union. To the first person who can induce the Bell Telephone Company to bring suit against them in the State of New York for infringing the Berliner patent by using or selling our telephones, we will pay $300 cash, provided we are furnished with evidence of such action and authority to defend the suit."

A New Cable to the West Indies.

The United States and Haiti Cable Company has chartered the cable steamer Mackay-Bennett, owned by the Commercial Cable Company, for the purpose of laying the first section of a submarine cable to connect New York direct with Haiti, West Indies. The United States and Haiti Company will handle business for the West Indies, Venezuela, the Guianas, and Brazil. The Board of Directors of the company, which is an American corporation, are John W. Mackay, George G. Ward, J. W. Mackay, Jr., A. B. Chandler, and Albert Beck.

Ask for a Receiver.

Suit has been brought at Indianapolis, Ind., by W. C. McCurdy and David B. Smith for the appointment of a receiver for the Phœnix National Telephone Company. It is alleged that the defendant company made a contract with the plaintiffs to construct telephone exchanges at Huntington, Shelbyville and several other towns in Indiana, and that they have refused to pay the 5 per cent. due under the agreement.

Telegraph and Telephone to be Combined.

The Swedish state telephone authorities are about to combine the telephone with the state telegraph system. In future every subscriber will be allowed to make use of his telephone address as his telegraph address, which will entitle him to the free transmission of telegrams between the telegraph office and the subscriber's telephone.

Bell Telephone Output.

The American Bell Telephone Company's output for the month ending September 30 was: Gross, 18,318, increase, 9,084; returned, 5,659, decrease, 1,007; net, 12,659, increase, 10,091. For the fiscal year ending September 30: Gross output, 128,223, increase, 65,845; returned, 61,510, increase, 7,864; net output, 66,713, increase, 57,981.

Another Company Feels the Pressure.

The Philadelphia Telephone Company, which has been doing business from "P. O. Box 707," Philadelphia, has sent out the following: "Owing to patent litigation we are compelled to suspend business in the telephone line."

Another Atlantic Cable.

A contract has been signed for laying a cable from Brest to New York, to connect the French telegraph system with the Antilles.

The capital stock of the Electric Messenger Company, the vigorous anti-Bell Telephone Company of Pittsburg, Pa., has been increased from $250,000 to $1,000,000 and it has been decided to push the work of construction as rapidly as possible. Already a line has been constructed from Wilkinsburg to a point several miles beyond Greensburg. The line will be continued east, and it is expected that Altoona will be reached before the close of winter. No attempt will be made to lay the underground system in Pittsburg before spring, as an ordinance forbids the tearing up of paved streets after October 1. The main line of the company will parallel the Pennsylvania Railroad to Philadelphia, with branches into populous districts. The general charter also includes lines through the Ohio, the Allegheny, the Monongahela and Youghiogheny valleys, and along the principal railroads to the great lakes.

Negotiations are under way whereby the Western Electric Telephone Company of West Union, Ia., will become an ally of and connected with the La Crosse Telephone Company of La Crosse, Wis., in the construction of a line which will connect the principal cities of Southern Minnesota and Northern Iowa.

The Farmington Telephone Company, Uniontown, Pa. has let the contract for the extension of its line to Gibbons Glade via Elliottsville. C. W. Leib and John Umbel are the contractors. They expect to have the line completed by October 15. The line will be extended into West Virginia.

The Richmond Standard Telephone Company, composed of Richmond and Manchester men; the Home Telephone Company, which is backed by Baltimore men, and two New York telephone contractors are bidding for a telephone franchise at Richmond, Va.

The opening of the exchange of the Phœnix Telephone Company at Altoona, Pa., has brought the Bell Company rates down to $1.75 and $1.25 per month. The Phœnix Company's rates are $2 and $1.50 per month.

The Cazenovia Telephone Exchange, Cazenovia, N. Y., has upwards of one hundred subscribers. This exchange is operating apparatus designed by D. H. Fitch, manager of the Beehive Electric Works, Cazenovia.

Plans are being prepared for placing the fire and police signal wires underground in Providence, R. I. An appropriation of $30,000 has been made to complete the work.

A. H. King, Jacksonville, Fla., is receiving bids for the complete installation of a telephone exchange plant of five or six hundred instruments.

An ordinance has been recommended to the city council of New Orleans, La., which requires the laying of all telegraph, telephone and electric light wires underground.

The Central Union Telephone Company has made a further reduction in rates to $20 and $15, to meet the competition of the new exchange at Champaign, Ill.

The Central Pennsylvania Telephone and Supply Company, Williamsport, Pa., has issued $120,000 thirty year six per cent. bonds to fund the floating debt of the company.

At request of the city authorities, the wires of the Western Union Telegraph Company will be placed underground at Bay City, Mich.

F. M. Zempe, J. W. Corbett and T. E. Goodale are interested in the formation of the Camden Telephone Company at Camden, S. C.

The Southwestern Telegraph and Telephone Company will shortly begin work on an underground system at Houston, Tex.

G. E. Huguley, mayor, will be manager of the new telephone exchange to be built at Barnesville, Ga.

B. W. Sharborough & Company are constructing a telephone system at Paulding, Miss.

A local exchange company is being organized at Henderson, N. C.

An automatic exchange plant is to be installed at Coudersport, N. Y.

A telephone company has been organized at Waverly Ohio.

ELECTRICITY.

How to Promote Telephone Companies.
The Fittest Will Survive.

EDITORIAL NOTES.

The Lenox Ave. Conduit Railway Every now and then the world is startled with the announcement that some existing want has been almost miraculously supplied. The world accepts these claims with undoubting faith, because the world at large does not reason closely, and because, as Barnum realized, it likes to be fooled. The engineer, however, is not of this class. He is cold and calculating, a cynic and an iconoclast, if you choose, and when these statements are made he sets himself down and *figures*. He may be willing to admit at once that the thing *can* be done in the specified way, but there is no sentiment about him—he wants to know if it will *pay*. If it will not, then to him it has no attractions and it might just as well not be invented.

There has, it is true, been a popular demand for a conduit electric railway system, and an example of such construction has for some time been in operation on Lenox avenue, New York City. This, from the start, has been heralded abroad as a successful solution of the problem, and Mr. John D. Crimmins is quoted as having proclaimed, after a few weeks' trial of the system under fair-weather conditions, that experience with it showed "that the saving in operating expenses is four cents per car mile as compared with cable traction and eight cents per car mile as compared with horses."

Let us as engineers consider this statement a little.

In the first place the conduit and roadbed are in this case exactly the same as they would be were cable instead of electricity the motive power, so that there can be no economy in these items. If any change were required it would be in the way of heavier and therefore more expensive construction for the electrical use, on account of the greater weight of the motor cars. For electricity an efficient drainage of the conduit far beyond that required for cable is a first requisite, so that we may say that if there is any difference in the cost of these items it will be in the direction of greater cost for electric traction; but for the purposes of our argument let us assume that this part of the investment is the same for cable and electricity.

The Lenox Avenue road consists of $2\frac{3}{8}$ miles of double track, upon which are operated at present 12 cars supplied with current from a station located at one end of the line and delivering current at a nominal voltage of 300. As a matter of fact, the voltage at the terminals of the generator is 350 volts, and at the further end, when all 12 cars are running, is 250 volts, or in other words the drop at the end of the line with 12 cars in operation is 35 per cent. These are actual figures, and the road as it stands is not a commercial project or an engineering feat worthy of the name. According to accepted engineering practice in overhead construction the drop in line should not exceed 10 per cent. The Lenox Avenue road is, therefore, throwing away 25 per cent., not of its coal alone, but of its manufactured power (which is a far more serious matter) over and above what is allowable in the overhead system; it means also that 25 per cent. more of boilers, engines and dynamos must be installed, and further than this, it is difficult to see how satisfactory or even tolerable service can be gotten out of motors subjected to a variation of 35 per cent. in voltage.

At present no feed wires have been installed, and it is manifestly unfair to criticise a road whose installation is confessedly incomplete.

Let us take it, therefore, as it is intended to be. It has been announced that eventually there will be 50 cars in operation and that the drop will be equalized by the proper use of feeders. What does this mean in the way of investment in copper with an initial voltage of 350?

Evidently the most favorable distribution of load would be that obtaining when the cars are uniformly distributed throughout the length of the road. The average distance then from the station of all the cars would be half the length of the road, or $1\frac{3}{16}$ miles. The length of feeders—outgoing and return—for each track would be $2\frac{3}{8}$ miles, and allowing 15 K. W. for each car would give for 25 cars a requirement of 375 K. W., which at 350 volts means a current of 1,071 amperes.

If a drop of 10 per cent. in the feeders is allowable, this means the placing of sufficient copper so that in the outgoing and return feeders $E = R\,C = 35 = 1071 \times R$, or $R = \frac{35}{1071} = .03268$ ohms; $2\frac{3}{8}$ miles $=$ 12,540 feet.

The resistance of 1 ft. No. 0 B. & S. wire is .0001096. The resistance of 12,540 feet will therefore be 1.374384 ohms. But the resistance of the line to give 10 per cent. drop must be .03268 ohms. The feeders must therefore be equivalent to $\frac{1.374384}{.03268}$ No. 0 wires. This figures out 42. In other words, the feeders must be equivalent to 42 No. 0 wires. A No. 0 wire weighs .3195 lbs. per foot; 42 No. 0 wires would weigh 13.419 lbs. per foot, and the $2\frac{3}{8}$ miles of feeders would weigh 13.419 $\times$ 12,540 $=$ 168,274.26 lbs. This is the weight of copper that would have to be put into one track. There are two tracks, however, and this amount would have to be doubled, making the total of copper required under the conditions amount to the enormous sum of 336,548.52 lbs.

If, however, instead of feeding into the center of the line alone, we have four feeders, the arrangement would be somewhat more economical of copper.

Under these conditions the total length of feeders for each track would be

			Lbs.
No. 1,	5,016 feet	weight	6,771.6
No. 2,	10,032 "	"	27,086.4
No. 3,	15,048 "	"	60,944.4
No. 4,	20,064 "	"	108,345.6
			203,148.0
For both tracks			406,296

Lead covered cable costs for 500,000 circular mils at the rate of 60 cents per foot.

Feeder No. 1 would therefore cost	$2,708.64
" No. 2 " " "	10,834.56
" No. 3 " " "	24,377.76
" No. 4 " " "	43,338.24
Total	$81,259.20
For both tracks	$162,518.40

No allowance is made above for placing the feeders underground or for the connections between feeders and mains.

The following estimate is given as the cost per mile of conduit such as that on Lenox avenue. The actual cost may have been more—it certainly was not less :

Wheel rails, slot rails, and joints	$6,468.00
Conductor rails	1,267.20
Bolts, nuts, washers, liners, tie-rods, etc	792.00
Yokes, man-hole frames, covers, and all cast iron	5,068.80
Insulators	264.00
Malleable iron clips	264.00
Bonds, finished (single bonding)	227.40
Excavation	2,376.00
1st class concrete for tube	5,068.80
2d " " " paving base	3,062.40
Track laying, hauling and temporary track	2,455.20
Taking up and relaying pavement	2.518.20
Total	$29,832.00

The above estimate is for straight single track, but includes nothing for drains or special work. At this rate the Lenox conduit

Cost 4.75×29,832	$141,702.00
Add for copper	162,518.40
Total investment in track	$304,220.40

This is an investment exclusive of motive power and rolling stock of $64,046.40 per mile of track, the interest on which at 6 per cent. would amount to $3,842.78.

It would seem, therefore, that this analysis conclusively settles in the negative the practicability of that kind of conduit road. Its chief difficulty lies in the necessary low voltage of distribution. Secondary to this is the high cost of conduit.

* * *

Facts For Thinkers. In the early days of electric street railroading, railroad men were taught by the manufacturing companies and their agents that with the adoption of the electric motor all street railway problems would be solved; that the expense of operation was so slight that a road in most any locality would pay, and that in prosperous communities it would pay to sacrifice the large investments in horses, etc., and substitute electricity. It came to be believed, also, that the earning capacity of the electric system would be so large that almost any capitalization would be safe. It was not enough to capitalize at the cost of the new equipment plus the loss on that discarded, but that this could be multiplied two or three times over with perfect safety.

We have now had about six years of what may be called the electric railroad era. Statistics are not yet abundant, but enough have been gathered to establish certain facts beyond dispute. The long record of receiverships, the longer list of roads whose electric equipment is already worn out but which cannot raise the money to replace it, show that all the rosy claims were not true—that the rapid development of the electric street railway business in America was based on a fallacy, or rather on several fallacies. But notwithstanding the disastrous results of over-capitalization already manifest, we read almost weekly of schemes for new lines or consolidations of old ones, with capital watered beyond anything known in the boom period. This shows either that the honest railroad men have not learned the lessons which have been taught by experience, or that the railroad business is beset by a coterie of schemers who can only bring further discredit on this class of securities by their operations, rendering it all the more difficult for legitimate business to be carried on.

Recent cases in point are the consolidations in Philadelphia and Pittsburg. The company recently formed to control all the main lines in the former city is capitalized at about $250,000 per mile, and in Pittsburg at $255,000 per mile. ELECTRICITY has no hesitation in predicting that a default in interest is sure to follow in both enterprises. And in pointing out to investors the risks they run in making street railway investments, the need of caution and of severe analysis, we believe that we are working for the best interests of the trade we represent.

We have views of our own as to the responsibility for the inauguration of the era of ballooned capital in this business. The old horse railroads were nearly all free from this feature. It came into prominence with the introduction of the electric motor. We are well aware that those accused by us of bad faith have one defence—ignorance. Leaving discussion of the responsibility for what has been done, therefore, let us look at the situation as it is to-day in the light of results achieved.

Probably no State in the Union is better adapted for the general introduction of trolley roads than Massachusetts. In no other State is the population so dense, the towns so near together. Certainly no other State has gathered such complete statistics, and we believe it is safe to assume that the results achieved in that State are more favorable than in any other.

It is therefore of more than ordinary interest to know what an unprejudiced authority, the Massachusetts Board of Railroad Commissioners, report as their conclusions, from statistics at hand, on the relative profitableness of horse and electric railway investments, and their views on the subject of capitalization. On these subjects these commissioners are on record as follows in their annual report :

> It is too early as yet to draw exact and final conclusions with regard to the financial economy of electric power, as compared with horse power, in street railway operation. It is desirable, however, both for the investor and the public, that current opinion on this point should conform as nearly as may be to the truth, and that false or exaggerated ideas, if such have gained a footing, should be set right.
>
> The question here is not whether electricity is a success as a motive power, or whether, taking into account the convenience, comfort and dispatch of street car travel on the one hand, and the obstruction and danger to ordinary travel on the other, the electric system is on the whole preferable to the horse system. The present question is whether the electric system promises a larger return on the capital invested, and thereby a possible future reduction of the charges for transportation ; so that the new system may be fairly expected in the long run to prove not only more remunerative to the stockholder but cheaper for the public.
>
> Tables have been prepared mainly with the purpose of throwing as much light on this question as the facts and statistics now at command will allow. These tables cover the period of ten years from 1884 to 1893 inclusive. During the first half of that period, the railways were operated wholly by horse power. During the last half, horse power ha been so rapidly superseded by electricity that already more than four-fifths of the railway mileage of the State is equipped for and operated wholly or chiefly by elecric power. A comparison of the railway year just closed with that ending in 1888, the last year in which the railways were operated wholly by horse power, will evidently afford the fairest and most satisfactory test of the financial results of the two systems thus far.
>
> The data furnished by the tables referred to for the selected years (1888 and 1893), as appears in the accompanying table.
>
> The gains which the above table shows in the average net earningsper passenger carried, per mile run and per round trip, ranging from 62 to 85 per cent. in favor of the year 1893, are certainly at first view very striking ; and, if these were the only elements in the case, the financial success of the electric system might be pronounced at once to be not only assured but marvelous. There are, however, other important and decisive factors which must not be overlooked.
>
> In the first place, any increase in net earnings must obviously be compared with the increase in the cost and capitalization of the electric over the horse system. The manufacturer whose new factory brings him in twice as much net income as the old, has gained nothing in the way of return on his investment if the new plant has cost twice as much as the old. So here, the most direct and conclusive test of the net earning capacity of the two systems, is a comparison of the increase in the net earnings per mile of railway with the increase in the cost of railway per mile. Applying this test, it will be seen that, while the net earnings per mile are 57 per cent. greater, the cost and capitalization per mile are respectively 60 and 65 per cent. greater in 1893 than in 1888—the odds being clearly in favor of the horse system.

Comparative Earnings and Cost of the Horse and Electric Railway Systems.

EARNINGS AND COST.	In 1888.	In 1893.	Percen. of Increase
Net earnings per passenger carried	0.96 cts.	1.56 cts.	62.50
Net earnings per car mile run	5.56 cts.	9.65 cts.	73.56
Net earnings per round trip	40.00 cts.	74.00 cts.	85.00
Net earnings per mile of railway	$ 2,420	$ 3,810	57.44
Cost of railway per mile	33,695	53,986	60.22
Capitalization per mile	32,304	53,367	65.20

> In the second place, it must be taken into account that the electric railways, with their power stations and electrical equipment, are all of new or recent construction. Their first cost and the cost of reconstructing and electrically equipping the original horse railway lines have been charged, of course, to the construction and property accounts, and not to operating expenses. As in the case of a newly built and furnished house, the necessary repairs and renewals for the first few years are comparatively slight. For this reason, the cost of the maintenance of the new system, which is chargeable to operating expense, has thus far been abnormally small and the consequent showing of net earnings from operation has been abnormally large. The extraordinary reduction for the last two or three years in the ratio of operating expense to gross income from operation, is largely, if not wholly, to be explained in this way.
>
> The generation and distribution of electric motive power involve expensive plants, costly machinery and intricate apparatus and appliances, all of which must be kept in perfect working order. The wear and tear of roadbed and track are increased by the heavier rolling stock of the new system. As time goes on, the cost of renewals and repairs cannot but increase or be otherwise than large ; and this cost must go into operating expense. The net earning capacity of the electric system will not, therefore, have been fully tested until time and experience have demonstrated the normal and full average cost of its maintenance ; and the net results as they now appear must be qualified accordingly.
>
> One other test may perhaps be fairly applied to the working of the two systems thus far. The horse railway companies, for the five years next preceding the introduction of electric power, maintained an average surplus of 12.45 per cent. on their combined capital stock. For the five years since its introduction, this surplus has been steadily drawn down to an average of 3.51 per cent. for the five years, reaching the last year its lowest ebb at 2.09 per cent. On the other hand the average dividend for the last five years (6.44 per cent.) has exceeded that for the first five years (5.66 per cent.) by less than one per cent. This shows that the railway companies as a whole have been running closer and closer to the wind during the electric period, and have subtracted from the old surplus much faster than they have added to the new divisible income.
>
> We must conclude, then, taking everything into the account, that there has been thus far no demonstration of the superior net earning capacity of the electric as compared with the horse system, but rather the reverse. It is not, however, intended to raise the inference that the electric system is, or is likely to prove, under conservative and proper management, a serious financial failure. The conditions attending its further and fuller development will probably be found to differ in no essential respect from those attaching to the old horse railway system, or to the steam railroad system.
>
> It can and should be said, however, without hesitation or qualification, that the electric system has not shown or indicated any such margin of profit as to justify the expectation of more than moderate and ordinary returns on money legitimately invested in it. The idea, which seems to have obtained some currency, that the electric system is a bonanza of rare and inexhaustible wealth, is clearly a delusion, and has doubtless proved to some a snare. The absolute cost and expensiveness of the system, under the most conservative, able and honest management, are sufficient to task its earning capacity to the full limit. There is no margin for fictitious or inflated capitalization. It presents no safe or inviting field for speculative enterprise or manipulation, unless it be to the unscrupulous operators of an inside ring who are willing to practise on the credulity of a misinformed public. Wherever there is reason to believe that water has been, or is about to be, injected into the stock or bonds of an electric railway company, the only safe course is to let its securities severely alone.
>
> Instead of inflating the liabilities and straining the earnings and surplus for the division of ostensible profits, the manifestly safe and imperative policy for the electric companies—and that without special regard to the

present unusual stringency of the times—is to keep the capitalization and charges upon income within the narrowest practicable limits, and to set apart year by year some substantial portion of the earnings as a fund for *future contingencies*, and for the increasing burdens of expense which are sure to come and whose weight is now only partially felt or known.

The conclusions here reached must be accepted as correct. Taking into consideration what is generally *known* as to the capitalization and condition of American street railway properties as a whole, is it *not* time to hoist the danger flag? Is it not time for investors to exhibit more and more caution as to this class of securities? And is it not time for those interested in legitimate street railway work and finance to set their faces against all schemes for excessive capitalization based on a gamble as to what electricity will save in operation? We think it is.

The total capitalization of our street railways today is more than $1,300,000,000, more than $95,000 per mile of track. According to the best authorities this represents an actual investment of not over $450,000,000. In other words, these securities are based upon one-third money and two-thirds water.

Is there any doubt of what the outcome must be?

There is some wisdom in a recent editorial in the Philadelphia *Press*, concluding as follows:

"In all developments of new industry and transportation there is always a period of experiment, a period of expansion, and a period of liquidation. In electric railroads the period of experiment ended in 1888. The period of expansion is still in progress. The period of liquidation cannot be distant."

Of course we know that the periods of experiment and expansion have so far been cotemporaneous. But should not expansion end now? And will not the shock and depression entailed in the period of liquidation be much less severe if the railway men of the country realize now that the electric railway business is not a sure bonanza, but that profits to the investor can only come with careful, honest and conservative management?

The frozen truth is that scarcely a business in the country presents more obstacles against converting supposed profits into divisible cash than the street railway business, whether the motive power be electric or something else.

* * *

The Trend of Electrical Development. In years gone by, and not so many years at that, almost the entire energy of investigators into electrical science was devoted to the improvement of the primary battery. There was indeed reason for this in that its efficiency was comparable to that of the steam engine and far in advance of any known methods of obtaining available energy from fuel. Its drawbacks however were many. The fuel, which was zinc, and the atmosphere in which it was consumed, which was the acid or saline solution, were far more expensive than coal and atmospheric oxygen, and the care required to keep the batteries in working order was excessive and burdensome. It seemed very possible, however, to so improve the details of the battery as to render its care less irksome, and invention turned its attention with considerable success in that direction. How to produce a cheaper fuel and atmosphere, however, was not so apparent, and practically no progress was made in that direction. With the advent of dynamo electric machines producing electricity from ordinary coal, and atmospheric oxygen through the intermediary of the boiler and steam engine, notwithstanding an inefficiency of over 90 per cent. as against about 20, the primary battery came into disfavor and those who continued the investigation of the great problem connected with it became themselves the subject of obloquy and derision.

The dynamo electric machine has now been developed so nearly to its theoretical limit as to leave no reasonable expectation of any further advances in the way of efficiency.

In the meantime electro-chemical science has been advancing with giant strides, and many metallurgical operations which before were dependent directly upon the combustion of coal are now performed more quickly and more cheaply by the intervention of the boiler, engine and dynamo.

It is the dynamo itself that has rendered this possible, and the next step will be that the dynamo by familiarizing us with electro-chemical processes will enable us to produce electricity itself by electro-chemical processes.

There seems to be no question that galvanism is to be re-enthroned somewhere in the near future. It will not entirely supplant dynamo electricity however, for the latter will always have its field of usefulness, and there will always doubtless be conditions where, even with its 90 per cent. inefficiency, it will be cheaper than the battery method, but it is not to continue to hold undisputed sway as it has during the past decade and more.

It is idle to suppose that any method can be devised of consuming zinc to compete with coal. The economic possibilities of batteries consuming zinc have been almost as nearly reached as have those of the dynamo, and no further progress can reasonably be expected in this direction. Nor is it reasonable to expect that electricity will be generated by chemical means directly from coal.

The fuel for our boilers requires some preparation before it can be economically employed there, and it is to be expected that it will require some special preparation to adapt it to the direct production of electricity. Under our boilers the admission of atmospheric oxygen has to be carefully regulated else the results obtained are unsatisfactory. It is not unreasonable then to expect that the method of burning our fuel for direct electrical production will have to be carefully considered.

The direct production of electricity from fuel does not therefore mean the burning of an unprepared fuel in an uncontrolled atmosphere, but means a proper preparation of both, and their especial adaptation, so that the latent energy may become manifest in the electrical instead of the heat form. These are all problems for the electro-chemist, and they are problems that are being attacked by so many vigorous thinkers that their solution must be in the order of things.

Under the Searchlight.

Views and Opinions on Timely Topics.

Speculative Telephone Enterprises.

It was, of course, to be expected that with the first apparent break in the monopoly of the Bell Telephone Company there would be attracted to the telephone field a number of adventurers, schemers, chevaliers of fortune and out and out swindlers. The appearance in the field of several companies made up of this element has, therefore, created no surprise. But in the telephone business, as in any other legitimate industry, the appearance of such elements need create little alarm. Their activity is bound to be short-lived. They lack all the qualities necessary for survival in honest business, and quickly work their own destruction. Of course they should be exposed by the press whenever they hang out their signs, but even if they escape the notice of the press, they inevitably expose themselves.

It is not to telephone companies made up of men of no reputation, or worse, that ELECTRICITY calls attention this week. It is to a single company far more dangerous, because it has appealed for public favor under the names of men of the highest standing, supposed, by reason of their previous honorable careers, to be far above the methods of the ordinary swindler—men who are popularly supposed to be the apostles of probity and fair dealing.

We have already commented in previous issues on the affairs of the Harrison and Standard Telephone companies. Their conduct of their business has not been such as to warrant any confidence that they were to be of any real service to the public in breaking the monopoly of the Bell Company, or that the investor in their securities, rights or franchises would ever receive any legitimate returns on his investment.

While there are many less conspicuous companies in the field working conscientiously to do a legitimate business, free from infringement of any valid patents, it was feared some time ago that the two companies referred to were working on entirely different lines, their only reason for existence being the sale of worthless rights and stocks.

Yet the names of some of our best citizens on the boards of these two companies have been so far sufficient to ward off severe criticism.

On another page of this week's issue of ELECTRICITY will be found a photographic copy of a circular issued by the Standard Telephone Company of New York, which is worthy of careful perusal. Any extended comment on this circular, or on the company issuing it, would be superfluous. We may well pass over the impossibilities promised in the first part of it, and confine our attention to the closing paragraph, in which such sentences as these appear:

"*So that the promoters of a local telephone company, under a Standard Telephone Company's license, have $20 in cash net profit on each 'phone to play with, and a stock interest in every telephone of $34 to grease common councils, to sell to local third-floor, sub-cellar investors, etc. Yet the boys who are in the real pot, if they play their cards right, will have the control of every local telephone company's plant,*" etc.

We know of nothing to equal this, not even in the green-goods circulars confiscated from time to time in the New York post-office.

The humiliating part of the whole thing is that the Standard Telephone Company was not started by men of no reputation. It has been supported from its beginning to the present time by men of national reputation, men who are supposed to be far from the rank of common swindlers. ELECTRICITY demands of each and every one of them that they confess their participation in a disgraceful swindling scheme, or make immediate public announcement that their names have been used without warrant.

Some of the names given in the daily press of men associated with this company in the beginning were:

THURLOW WEED BARNES, President.
CARL F. BAKER.
JAMES S. CLARKSON.
A. L. CONGER,
JOHN W. CANDLER.
GEORGE CROCKER.
HENRY MERZ.
M. C. PALMER.
FELIX RAKEMAN.
JOHN E. SEARLES.
CHARLES T. STRAUSS.
LOUIS WINDMULLER.

The men comprising the Standard Company are supposed to have received about $300,000 for local rights.

We do not know what patents they claim—we do know that instruments so far turned out under their name have been practically duplicates of Bell instruments. The company does not claim to have any factory. The few instruments it has were made under contract. Local companies which paid their money for rights have been unable to secure any beginning of a telephone exchange or system. Yet the company continues its efforts to sell *rights*.

We believe that every man who has paid one dollar into the treasury of this concern has been the victim of a gross swindle. We do not believe they will ever install an exchange. We advise every investor to take steps at once to recover his money and to locate those responsible for the misrepresentations.

Such methods as those described are a disgrace to any business, and it is pleasant to know that the great majority of telephone companies are of a very different stripe. They are in the business because they believe they have a right to be in it. They are selling apparatus, not patent rights, and they will bear comparison with any other class of business concerns.

* * *

"What's In It For Me?"

A SERMON.

A few weeks ago ELECTRICITY referred briefly to the retirement of Mr. L. H. McIntyre from the service of the People's Traction Company, of Philadelphia, the reasons therefor and some of the circumstances connected therewith. Since the public announcement of his retirement, made exclusively in ELECTRICITY, there has been much discussion of all the varied questions bearing on the subject, and an astonishing variety of views have been expressed. It is held openly by some that McIntyre was fully justified, and that the giving and taking of bribes, misnamed commissions, is perfectly proper. This is the same theory upon which John Roach conducted his affairs with the United States Government, that men were merchandise, worth so much apiece, and that trading in men was as legitimate as trading in iron.

ELECTRICITY has no desire to make a scapegoat of L. H. McIntyre for all the evil in the commission thievery, but he deserves no sympathy, and his case will do as well as any other to illustrate the main features of the system.

The notion that a man entrusted by a corporation with the purchase of goods, or whose opinion as to quality is relied upon and paid for by the corporation, may accept a commission from any salesman, is not widely different from the notion held by dozens of corporation officers who would scorn to take commissions that they are at perfect liberty to make all the money they can by reason of their official positions.

Nothing went further to wreck the Brooklyn City Railway system than the application of this idea in the management of the system. The president had no hesitation in asking himself frequently, "What's in it for me?" And when Daniel F. Lewis, head of the firm of Lewis & Fowler, sold to Daniel F. Lewis, president of the Brooklyn City Railway Company, millions of dollars' worth of the manufactured product of the former company, he set an example of breach of trust which men in humbler positions could not fail to imitate.

Lessons are always more easily taught by specific examples, and we propose to call attention to a view of the evils of the "commission business," as made clear by the conduct of Mr. McIntyre.

He was a graduate from the Thomson-Houston Company's office in Boston. He had no lack of examples to follow when he started to work his system. His first position of consequence was with the Huckleberry road in New York. He applied himself at once to his special line of work—selling his influence with his company for so much cash. The company had confidence in him, trusted his judgment, and it is doubtful if any considerable purchase was made without McIntyre's hand was greased. We know of one salesman who was expatiating on the merits of his apparatus when McIntyre suddenly interrupted him, asking; "What do I care about that? What's in it for me?" He cared less about the actual value of what he spent the company's money for than he did about his "share."

Leaving the Huckleberry road, McIntyre went to Brooklyn, holding a similar position with the Atlantic Avenue system. Here he applied the same principles of business. From Brooklyn he went to Philadelphia.

It is not within the scope of this article to detail all the different trades made by Mr. McIntyre for the Philadelphia Company. We call attention to a few of them only, leaving the moralizing to our readers.

At one time when a large quantity of conduit was to be bought, four companies had expressed their intention to bid. Their representatives were sent for one after the other, and received instruction from McIntyre about as follows:

A was told to bid $450,000, allowing $25,000 for a commission;

B to bid $425,000, leaving $50,000 for commission;

C to bid $415,000, leaving $75,000 for commission.

D to bid $410,000, leaving $10,000 for commission.

D was the man who was booked for the job and who got it. This conduit deal was one wherein McIntyre failed to carry out his plan, as the successful bidders refused to pay unless McIntyre's board of directors approved of it. Thus we have one instance of the railway company paying several thousand dollars more on a certain part of their equipment than they would have paid if bidding had been done on the square.

One of the General Electric agents has confessed to having paid $25,000 commission on one trade, and a representative of the Sperry Electric Company of Cleveland paid $12,000. The payment of this commission was known to the entire board of directors of the Sperry Company, and every stockholder of the company had a hand in the sale, including Mr. Coffin (who told Mr. McIntyre to buy it), Herrick, Lawrence, Miles and Parmlee. Any one who knows what Sperry apparatus is knows that no sane business man would have bought it, and that the $100,000 or so paid for it was all wasted, in order that McIntyre might make his $12,000 commission.

It is further in evidence that supplies which could be bought on the right basis were bought without limit. All that was necessary for McIntyre was to get his commission; the interest of his employers were never consulted for one moment.

Enough has been said, we think, to show clearly that it is impossible for any man working upon the McIntyre method to give honest service to his employers, or to guard their interests. The subject therefore at once broadens into one of interest to every stockholder in railway securities.

Now we propose to show another form of injustice which the rascally commission business works upon decent manufacturers.

In January, 1894, the People's Traction Company advertised for bids for 300 cars and 250 trucks. The J. G. Brill Company had never done any business through McIntyre, because they had steadily refused to do business on his plan. On this contract they started in to make their fight over McIntyre's head, and now the Board of Directors, in spite of McIntyre's opposition, he charging that the Brill Company did not know how to build a serviceable truck. Mr. John A. Brill went before the board in person and told them in plain language just why McIntyre carried an unfavorable opinion of Brill trucks. The contract was finally divided between the Brill Company and the Peckham Truck Company. At the end of ten months not one dollar had been spent for repairs on the Brill trucks, and the Peckham trucks had cost, according to a director of the company, nearly their original purchase price in rebuilding. Notwithstanding this record, McIntyre summarily threw off all the Brill trucks, stating that they were not fit to use. A new order was placed with the Peckham Company, who took the discarded Brill trucks in exchange.

Immediately the Peckham Company began to advertise that on one of the leading railway systems of the country Brill trucks had been discarded "because they could not properly support the car bodies, and because they hammered the rail joints and special work." They also sent out circular letters to prospective purchasers, of which the accompanying is a sample.

This proceeding was, of course, only the natural outcome of the McIntyre system applied to its full limit, and so far as the Peckham Truck Company were able to do so, with McIntyre's assistance, the Brill Company was grossly injured in its business, notwithstanding the fact that the record of the Brill trucks on the People's Traction Company's system had been far better than that of the Peckham trucks. About $26,000 had been paid for the Brill trucks by the railway company, and a large part of this amount was sacrificed in the exchange. Enough has been said, we think, to show the evils which this system of accepting commission involves. It means the moral debasement of every man sanctioning it. It means that the actual purchaser pays more for his supplies than he otherwise would pay. It means that the honest manufacturer who refuses to be blackmailed suffers a gross injustice even though his product is infinitely better than that of the man who cheerfully pays commissions. If there is any good in it to offset the evil features, we would like to have them pointed out to us.

It is worthy of notice that in Mr. McIntyre's statement in defence of his actions in Philadelphia he does not deny the acceptance of commissions or salaries from the manufacturing companies, but he takes the extraordinary ground that he was fully justified, and that the railway companies were fully posted in advance. He confessed that while he was holding the position of general manager of the People's Traction Company he was drawing a regular salary from the G. E. Company and the Peckham Motor Truck and Wheel Company while at the same time he was purchasing the apparatus of these companies for use on the railway system of his employers.

GENERAL OFFICE OF THE PECKHAM MOTOR TRUCK AND WHEEL COMPANY.

1820 Havemeyer Building. 1412 Cortlandt.

Works at Kingston, N. Y. Telephone Call: 26 Cortlandt street,

Offices at
New York, Chicago, Philadelphia,
Boston, San Francisco, London.

NEW YORK, February 4, 1895.

Oakland San Leandro & Hayward Electric Company,
Oakland, Cal.

GENTLEMEN: We beg to inform you that we have for sale 125 Brill's No. 21 solid-forged trucks, fitted for G. E. 800 motors, which we have taken in exchange from the People's Traction Company, of Philadelphia, who have adopted our extra long 6 E Truck as their standard for both their 20 foot closed and 30 foot open cars. As to their reason for doing so we refer to them by permission.

These trucks have only been in service from four to six months and are practically as good as new. If you can use the whole or any part of the 125, please advise and we will quote you a low price for them. Trucks can be seen at the barns of the People's Traction Company, at 8th and Dauphin streets, Philadelphia.

Awaiting your reply, we remain,

Very truly yours,
THE PECKHAM MOTOR TRUCK & WHEEL CO.
W. E. COOKE

We do not think that in this commission business the man who accepts commissions bears the chief guilt. This rather lies with the manufacturing companies whose anxiety to sell an inferior product, and to make illegitimate profits, has led them to adopt a systematic plan of debauching purchasing agents throughout the country, and it is not at all surprising that when, as in the Philadelphia case, the briber and accepter of bribes fall out, the former does all in his power to hasten the downfall of the latter.

So far no action has been taken against Mr. McIntyre in Philadelphia, although there has been a great deal of talk of the railway company recovering the amount of various commissions known to have been paid.

Reference was made above to the $25,000 commission paid by the General Electric Company. So far as our information goes, the responsibility for the payment of this commission lies with Captain Eugene Griffen and E. D. Mullen, who arranged the matter, and it is proper to add that Mr. O. T. Crosby, who was instrumental in the sale, refused to have anything to with the commission business.

We trust that what we have said may have some influence in ridding the electrical trade of the methods described. ELECTRICITY stands ready to expose everything of the kind wherever found, and we believe that every man who wishes well for the industry should assist us in our campaign.

If there are those who defend the practice, would it not be well at the next meeting of the American Street Railway Association to have an open discussion on the subject.

Development of Street Railway Apparatus.

A RETROSPECT.

BY NELSON W. PERRY, E. M.

It is sometimes as difficult to realize what has been as it is to predict what may be, and in no direction of human progress have the years been more revolutionary than they have been since electricity became a commercial factor. So great have been the changes that this agency has wrought in our surroundings, in our methods of living and in our very methods of thought, that to go back a decade seems almost like delving into ancient history.

It would be incredible if we did not know it to be a fact, that but nine years ago the first commercial electric railroad in America started its cars. This event, which occurred in the city of Scranton in the fall of 1886, was pregnant of far greater results than even its most enthusiastic friends then dared dream of.

The three cars, the few miles of track and the investment of the few thousand dollars of that year have become 20,000 cars running on over 80,000 miles of track and involving an investment of capital in the State of New York alone of upwards of $200,000,000.

With this condition of affairs around us it may not be uninteresting or inappropriate at this time to look back to the beginning.

The city of Scranton is situated in the heart of the largest anthracite coal basin in America. Its houses are undermined by the busy miner, and many of its unbuilt-up portions, even in what would otherwise be the heart of the city, are covered with enormous and rapidly increasing piles of refuse coal.

These culm piles, however, are the present source of all the power of this enterprising city, and he who owns a culm pile, if he hold on to it long enough, may be richer than he who owns a coal mine, for as the latter is depleted the former grows.

At the base of one of these heaps of refuse is located the Suburban Electric Light Station, and it was from this station that power was furnished for the Van Depoele road. On a recent visit to this locality the writer saw the three original machines, now no longer in use, but preserved as interesting historical relics.

One looks at these massive machines with their long magnetic circuit with astonishment and awe, but when he remembers that the attributes of the magnetic circuit were not so well understood then as now, and that the dynamo designer's art was then only empiricism, he is not so much astonished to find almost every fundamental rule violated.

These machines have all been modelled over since they ceased their first usefulness in the endeavor to make them earn at least their own living. Two of them were remodelled into alternating current machines, and although at the hands of such skilled doctors as Prof. Elihu Thomson and Merle J. Wightman, and although each of them contains just about twice as much iron and twice as much copper as modern machines intended for the same output, they heated up so much after half an hour's run as to render further service from them impossible. The third machine was then rewound as an arc machine, but this, like the other two, proved more profitable as a historic relic than as an active participant in the lighting arena.

An interest still attaches to this electric lighting station quite apart from that of historical association, in that probably with a single exception it comes more nearly getting its fuel for nothing than any other station in the world.

In fact the conditions are such as would make the average street railway manager's heart rejoice. They are these:

The parties who own the station also own the culm pile, and the land upon which the latter stands is becoming exceedingly valuable. There is a demand for the land and there is a demand for the culm, and the owners of the latter are trying to supply both.

The preparation of the culm for market consists simply in running it through screens so as to divide it into products of different sizes.

In order to bring it to the sizing screens it is merely shovelled from the bank into a mechanical conveyor. The coal in its travel passes for a distance over a perforated plate, through the perforations of which the dust and other fine refuse drops. This refuse, which is scarcely a marketable product, is taken by a conveyor in the opposite direction and by this delivered directly into the bins of the lighting station, whence it descends by gravity in front of the boilers. When dampened down and used on proper grate bars it makes an excellent fuel—equal in value to about 75 per cent. of that of good egg or buckwheat coal.

The next landmark in the progress of electric traction was the Richmond road, the story of which Mr. Sprague so entertainingly told in ELECTRICITY in 1891 and repeated with some additions and omissions in the *Engineering Magazine* for September, 1894.

The story is so well known to all electric railway men that it does not need repeating here, but like the trials and tribulations of the Pilgrim Fathers, it must ever have a keen interest for those who have benefited from these pioneer labors.

It will be remembered that the contract for this, at that time herculean, undertaking was made in May, 1887, and called for the completion in ninety days of the equipment of a road having about twelve miles of track, at that time unlaid and the route determined only in part; the construction of a complete steam and electric central station plant of 375 H. P. capacity; the furnishing of 40 cars with 80 motors and all appurtenances necessary for their operation; 30 of these cars were to be operated at one time, and grades as high as 8 per cent. were to be ascended.

And furthermore, the contract was undertaken under a time forfeit.

Certainly this would be no small undertaking at the present day with all of our experience and the precedents of past successes and failures to guide us, but when we consider that there was no practice at that day except that which indicated what not to do, and not much of that, we can but wonder at the audacity which prompted the undertaking.

The track was laid with a 27-pound tram rail and the curves were many and sharp—some of them as low as 27 feet radius.

We laugh at 27-pound rails to-day, but what was there at that time to indicate that a heavier one was needed? The steam roads with their high speed, heavy locomotives and freight traffic were using 50 and 60 lb. rails, and the wisest steam railroad engineer would have scoffed at the idea of using for street railway purposes rails of 90 to 98 lbs., which even the steam roads of to-day with their increased train units have not yet come to, except in perhaps a single case.

The motors used were at first 7½ H. P. Two of these to the car it was not unnatural to suppose would be ample, but Mr. Sprague soon found that he needed more. Ten H. P. motors were substituted for the smaller ones, and these again gave way to 15 H. P. motors before the road was in actual commercial operation.

As indicating pretty closely the state of the art at this time there is given below a complete specification and bid, which electric railroad men to-day will read with interest.

SPRAGUE ELECTRIC RAILWAY AND MOTOR CO.,
185 and 187 Dearborn Street.
Western Agency.
C. E. BARCLAY, Manager.
CHICAGO, June 29, 1887.

MR. B. H. LANGLEY,
President Winona City Railway, Winona, Minn.

DEAR SIR: Herewith we send you proposal for electric equipment of your road.

You will notice that the motors can be speeded up to 10 miles per hour if necessary. That is a very safe speed to run cars operated by electric motors, for the reason that they can be stopped so quickly. One of the reasons why city councils object to street railways running at a high speed is because of the inability to stop them quickly by the ordinary brake, but this is overcome by the increased friction on the wheels by reason of the additional weight of the motor on the car as also the rapidity with which the electric braking acts. Now in view of the foregoing fact you may not need so many cars as you first anticipated, and of course there will be a proportionate difference on the total estimate for any lesser number; 10 to 12 cars would give you a 6 minute headway.

In event of an excursion, etc., being in town, an additional car can be attached to any one of these cars, but of course would necessarily have to be run at a somewhat lower speed. The item of pole line: this price would admit of operating a larger number of cars than herein estimated for. Please observe the matter underlined in proposal relative to the overhead line which will explain itself. This method is the only one to operate a single track with turnouts successfully. It may not be the cheapest in first cost, but it is the cheapest and most practical for every day work.

The cost at which you can generate steam in Winona: I figured that it would cost you 50 per cent. to operate the road by motors as against horses. Another point in favor of electrical equipment is, that each car can make more car miles per day, thus necessitating less rolling stock, less storing room and, greatest saving, a less number of men employed. This item foots up very quickly.

You will find this estimate comes out about $2,000 per car. If there are any points you wish information on, I would be pleased to supply such on hearing from you.

Very truly yours,
SPRAGUE ELECTRIC RAILWAY AND MOTOR CO.,
C. M. BARCLAY.
